Hitherto the major emphasis has been on environmental H. and in the past hundred years enormous improvement has taken place, evidenced by the complete disappearance of scourges such as plague and cholera, the almost complete control of such diseases as typhold and dysentery, the very much reduced death rates from other infectious diseases, the much improved infant and maternal mortality rates, increased expectation of life, etc. There advances are undoubtedly due largely to the vast changes effected in environmental H., of which the most important are: (a) provision of ample run-ning water supplies which have been ning water supplies which have been rendered pure by protected storage, fol-lowed by physical filtration and chem, trotment; (b) the easy and safe disposal of sew age made possible by running water, by which it is transported through drains to sewage works where tanks, filter beds, etc., result in an efficient which can be safely discharged into rivs., sea or on to land without danger to health; (c) slumcherance and improvements in housing conditions with reduction in overcrowding and the better provision of fresh air, ventilation and similght, the better provision of both natural and artificial highting, the increased use of electricity and gas with diminished atmospherio pollution of urban areas as well as the contribution to cleaniness, comfort, and warmth in the bone, the provision of parks, recreation grounds and open spaces where exercise, fresh air and sun are more madily available, (d) regular collection of refuse and its disposal by incineration or controlled tipping, with the diminution of musance generally and the reduction in breeding grounds for files and vernin in particular; (c) the control of food from the abattoir through the channels of wholesale and retail distribution, preparation and consumption, to promote both improved quality and freedom from contammation of the nation's diet. Special legislation controls the production, handhing heat treatment and sale of milk, which is of particular importance in the diet of the young and a potential danger if insected.

The control of infections varies very Hygiens, derived from the Gk. Hygeia, much with the disease concerned. An out-the mythical goddess of Health—em-braces all the factors, environmental and typhoid, is kept under control by the

provision of immediate notification, prompt | better methods of artificial feeding, the isolation of the patient at home or in a fever hospital, and through investigation to find and control the source of infection before the cpidemic spreads. Infections for which there is a proved prophylactic, e.g. diphtheria, have been greatly reduced by the widespread immunisation of young New drugs for treatment have children. reduced the incidence of serious complications in measles and whooping cough, while the use of new chemical insecticides, while the use of new chemical insections, such as D.D.T. and gammexane, has much simplified control of in-sects such as files, lice and bedbugs. The entry into this country of communicable diseases such as smallpox is prevented by Port H. which includes control of all arrivals both at sea and air ports, the quarantine of suspects and the subsequent disinfection and disinfestation of ships and aeroplanes.

Personal H. is of more recent growth and is promoted principally by services which start before the individual is born and follow his varied needs up to adult The foundations of personal health are laid within the months before birth. and so the care of the pregnant woman is of considerable importance. The observance of simple rules for healthy living, with adequate rest, exercise and above all a balanced diet with extra vitamin supplements will go far to give the baby a good start. Intents of mothers with inadequate diets during the early months of pregnancy show a higher death rate and succumb more quickly to infections during their first few months of life. Repeated and regular examinations by doctor and midwife detect the earliest departures from normality and ensure that corrective treatment can be applied as soon as possible to avert graver condi-tions. The provision of experienced obstetrical care, the increasing use of analgesics during labour, the growing analgesics during labour, the growing interest in the training in methods of relaxation ensure a low montainty and morbidity during delivers. Obstetrual hos-pital beds and emergency mobile obstetue units deal with complications or accidents. Post-natul care helps in the return of the mother to normal health and provides a chance for the prevention of chronic disabilities which may occur after childbirth. The increasing availability of trained home helps to tide the mother over this difficult period in the home is a recent and welcome development.

After birth the infant becomes the focus of expert care. Prematunty, until re-cently so potent a cause of nomatal mortality, has received special attention of late years and in some areas of the country premature baby wards have been opened and ambulance units are specifically trained in life-saving methods for the frailer infants. 'Flying squads' equipped to deal with gastro-enteritis, still the most fatal discare of infancy, are being devel-oped in the larger cities. Increasing em-phasis is being laid on the regular and frequent physical examination of the infant after birth with special attention to his growth, development, care and feeding. The encouragement of breast feeding,

better methods of artificial feeding, the provision of vitamin supplements, talks and demonstrations in the practical problems of mothercraft, visits by health visitors to give advice and help in the home environment are all measures which are bringing about a steady decrease in the infant mortality rate, one of the best available indices for judging the H. of a community.

As the infant grows there is often the provision of day nurseries and nursery schools where the working mother can leave her child under trained supervision and where the toddler gets his first opportunity to adjust to a social millen. The increased rate of infections in the day nursery, however, and the need of infants for individual mothering make it advisable that the day nurseries (for children under two) are used only for really necessitous cases. Children of three and four, on the other hand, who have had a year or so th a nursery school fit in much more quickly to ordinary school life at tive and gain many psychological as well as social and physical advantages. Children psychological development is disturbed are referred to Child Guidance Chinics. Much maladjustment can be traced to the impressionable days of early childhood. and these clinics are being more and more widely used as centres where 'difficult' children or children showing the early symptoms of anxiety and tailure to adjust, can be treated. In this was the more serious later stages of neurosis may be prevented. Often the more important work of these chaics is to help parents to understand the mental needs of the child in order to promote healthy, normal development.

The health and hygiene of the child during his school years is the special responsibility of the school medical service. with its periodic physical examinations. The early detection and treatment of defeets does much to improve his well-being. The child suffering from physical or mental handreaps is discovered early and the provision of special schools of varying types provide education suitable for him. Thus there are different schools for the blind, partially blind, deaf, partially deaf, empled, educationally subnormal, delicate (open-air-schools), maladousted, and in certain cases, diabetic children. For the medicable child there is increasing provision of occupation centres and institutional care where necessary, while careful supervision is maintained throughout life. Residential schools and hospital schools, whether temporary or permanent, provide for children who need long periods of con-vale-cence or for whom the home is unable to provide proper care. The school deutal service with its emphasis on conservative treatment of the child's seeth is producing a marked improvement in dental health. The provision of school meals and the milk-in-schools scheme has done much to improve the physique of the school child. while after-care agencies help to place the child when he leaves, in employment for which he is physically and mentally cap-

comes under the care of the industrial health service which was much extended during the past war. Canteens providing well balanced and cheap meals help to ensure the nutrition necessary for good work. In the larger firms the worker is put to the work for which, physically and mentally, he is most suited, and shifts from one dept. to another are often made in consultation with the medical officer or psychologist. Absenteelsm, sickness rates, output of work, the techniques of different processes and intra-dept, relationships are studied from both psychological and medical aspects an endeavour to make conditions of employment and H. of surroundings such as to promote the greatest efficiency, health and happiness with a regultant increase in production. In cases of injury or long ill-ness the provision of rehabilitation units raises morale and trains the worker to return to efficient employment.

The breakdown of mental health often arises from the home and emphasis on the individual as part of his family unit is therefore coming more to the forefront of social H. Experiments such as the Pioneer Health Centre (q.r.), Peckham, emphasise the nor seity for the family to he considered as a social unit, while Mar-riage Guidance Councils and Family Planning Associations, among others, are concorned with the need for proper sex education of children, preparation for marriage, advice and counselling within marriage. education in parenteraft, and in ways of increasing the health and happiness of the family. Social H. also includes the more negative aspects of family health as in the campaign against venercal disease and the widespread provision of centres for early

recognition and treatment.
The H. of old age is beginning to receive attention as the proportion of the pop-over sixty-five is rapidly rising. The loneliness, boredom and physical disabil-ities of old people are gradually being achostels, travelling canteens, and home helps are all efforts in this direction which are being made to alleviate this problem.

Tropical Hygicae includes most of the scope of H. in this country but concentrates much more on the avoidance and control of diseases almost or quite absent from Britain which are still the major scourges of warm climates. The largest group of these are those spread by insects, of which malaria (q,v_*) spread by certain anopheles mosquitoes (q.r.), is the most widespread, though plague, yellow fever and typhus are more lethal. Other groups of disease widely endemic in the tropics are the intestinal such as typhoid, dysontery and cholers and the parasitic, both internal and external. In the vast majority of all these discuses the cause, origin and modes of spread are sufficiently understood by W. science to make their control pos-sible by tropical H. See Sir G. Newman, The Building of a Nation's Health, 1939; J. D. Kershaw, An Approach to Social Medicine, 1946; W. W. Jameson and

Hygrometer, instrument for measuring the relative or absolute amount of meous vapour in the air. A hygrograph aqueous vapour in the air. A hygrograph measures and records the humidity on a chart similar to that used in a barograph.

Principles of Hygrometry: (a) Properfess of eapours.—It is a matter of common observation that water exposed to the air disappears more or less quickly. The floors of shops sprinkled with water in the hot weather quickly dry. A damp cloth exposed to the air becomes quite dry; on some days it dries rapidly, on other days very slowly, so that haundresses speak of a 'good drying day' and a 'poor drying day.' The scientific term for the disappearance of the water is evaporation. The water becomes a gas which mixes with the air. This gas is This gas is called aqueous vapour. To clucidate the cepted as a problem for society to tackle laws governing the evaporation of liquids, and welfare committees, Darby and Joan Dalton caused them to evaporate under clubs, special housing accommodation, the simplest possible conditions, viz. in a vacuous space, by introducing them into the vacuum above the mercurial column m a barometer. If a small drop of water is allowed to ascend to the top of the column it disappears very rapidly, filling the space above the mercury and pro-ducing a depression of the column, Another drop will also evaporate and produce a further depression, and so on. A stage is reached, however, at which a drop does not evaporate but forms a thin layer of water on the top of the mercury. The introduction of more bould is not attended by a depression of the mercury column if the temp, is kept constant. The fiquid merely floats on top of the mercury, showing that evaporation has ceased. The any more vapour; it is therefore said to be saturated, and the vapour in the saturated space is called a saturated vapour. The pressure of a saturated vapour is called the maximum vapour pressure. It increases with the temp., but is quite independent of the vol. of the space occupied

by the vapour. If the vapour pressure lever mechanism, at a given temp, is less than the maxinum vapour pressure for that temp, the placed by gold be vapour is said to be unsaturated. It has in Brit, radio-son been proved by Regnault that the presence of a gas does not affect the quantity of vapour which a space can contain. The rate of evaporation is decreased by the presence of the gas, but ultimately the quantity of vapour in a given space at the saturation point is the same whether the space is vacuous or contains air or any other gas which does not react chemically with water. Regnault determined the maximum vapour pressure of water maximum vapour pressure of water vapour at various temps by observing the depression produced by the vapour in a barometer tube. Since the quantity of vapour required to saturate a given space depends solely on the temp. the pressure exerted by saturated water vapour in a space containing air can be found from the tables of saturated vapour pressures compiled by Regnault. (b) Humidity in the atmosphere.—Air contains a proportion of water vapour which varies considerably from place to place and time to time. The ratio of the mass of water vapour to the mass of dry air is called the mixing ratio, if, at the same temp, the water vapour were saturated in the presence of a plane water surface this would be called the saturation mixing ratio with respect to The percentage ration of the den sity of the water vapour actually in the air to the density of the saturated water vapour at the same tomp is defined as the relative humidity. This is approximately the same as the percentage ratio of the mixing ratios and almost identical with that of the vapour pressure to the satu rated vapour pressure Given the temp of the air, then either of the quantities, mixing ratio or relative humidity, will determine the amount of water vapour in the atmosphere—If the air is cooled a temp, will be reached at which the saturation vapour pressure is the same as the vapour pressure of the air, conden-ation will then take place. This temp is called the dow-point, and it is also a measure of the humidity of the atmos-phere. Most Hs measure one of these three quintities. The also lite quantity of aqueous vapour in the air does not determine its dampness, but merely the proximity to saturation. For example, proximity to saturation. For example, suppose that, on a summer's day, the temp is 2) (', and that the pressure of the aqueous vapour is 15 mis, the air would fet dry because the saturation pressure at 25° C is 31 7 mis. On the other hand suppose that, on a cold winter's day when the temp is 5° C, the aqueous vapour pressure is 3 mis, the air would ie) very daint because the air would fel very damp because the saturation presure is 8.7 mls at "C". The mixing ratio in the former case is low. in the latter case high.

The hair hugrometer depends on the fact

Hair is also subject to lever mechanism. Hair is also subject to a temp, effect, and it is therefore being replaced by gold beater's skin, particularly in Brit, radio-sondes (see Radio-Sondes). These Hs have an additional disadvantage in that they have a slow response or lag, which becomes greater at the very

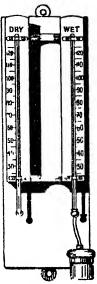

'lag,' which becomes greater at the vision old temps experient ed at high levels.

Dew-point Hygrometers. If an atmos-Dev-point Hygrometers. If an atmosphere containing aqueous vapour is gradually cooled, a temp will be reached at which the vapour will condense. This temp is called the dew point. At this temp the quantity of vapour in the air is just sufficient to saturate it. In an uncontined atmosphere the pressure of the vapour will not change during the cooling, hence the actual pressure of the vapour in the air is equal to the maximum vapour pressure at the temp of the dew point. If, therefore, the dew point is determined, the maximum vapour pressure for this temp is found from the tables of vapour pres-ures, and this is the actual pressure f of the vapour in the air.

Regnault's Hygrometer. In this instrument air is aspirated through ether contained in a silver thimble which closes the lower end of a glass tube Cooling is produced by the evaporation of the other, when the temp of the silver surface reaches the dew point, the polish of the surface becomes dimmed owing to the deposition of moisting The temp which this happens is read on a thermo-meter. The moment at which the dew appears on the thimble attached to the tube can be ascert uncd with great delicacy by comparing its surface with that of the surface of a similar thimble attached to the upper end of the glass tube which

contains nothing but an Dobson Breuer frost point hygrometer This instrument was invented during the A W Bitwer, it works on a similar principle to Regnault's hygrometer but is faster in operation and more suitably adapted for use in an aircraft and with very low temps. In its modern form the cooling fluid (liquid air) is pumped into a black thimble, a jet of an from outside the ener if is directed on to the thimble and witched by a photo electric cell. When the current from the photo electric cell is constant the deposition of frost on the thimble is balanced by the rate of evaporation and the temp of the thimble is then the frost point of the air. With this instrument were made the first accurate measurements of humidity in the high atmosphere, and in 1913 Brewer found the stratosphere to have a very low relative humdity

Het- and Dry bulb Hygrometer.—This instrument, which is also known as a psychrometer, is used at most observing stations throughout the world, cousists of two delicate thermometers attached to a wooden stand (see Fig.) One of the bulbs is covered with muslin and is that the human hair expands with in-the bulbs is covered with muslin and is creasing relative humidity, the instru-ment is not very accurate and has to be calibrated, but it is used almost uni-versally for autographic records. The ex-pansion in length is magnified by a simple is more or less cooled according to the hygrometric state of the air. If the air is quite saturated no evaporation will take place, and the temp. of the wet bulb is the same as that of the dry bulb. The drier the atmosphere the greater will be the difference in temp. between the two

WET- AND DRY-BUIR HYGROMI FER

bulbs. The formula connecting the vapour prossure, dry and wet-bulb temps was first suggested by E. F. August in 1825 and was modified by Regnault in 1825 and was modified by Regnault in 1825, Tables based on Regnault's formula were brought into use in England in 1926, replacing Glassher's empirical tables. Assmann found that the wind speed past the thermometer bulbs was important, and he devised an instrument, the 'Assmann psychrometer,' which sucked air mechanically at a known rate over the bulbs; he produced tables for use with his instrument and for other conditions. A sling psychrometer is used in the U.S.A. and tables very similar to Assmanus's are used with it. At Washington, in 1947, the Conference of Directors of the International Meteorological Organisation recommended the adoption of the new Goff-Gratch tables of asturation vapour pressure over pure liquid water; those have been used in calculating new humidity tables for aircraft observations. See Hygrometric Tables, 4th ed. H.M. Stationery Office Piscussion: 'The measurement of humidity,' Met. Mag. (London), 78, 1949, p. 169.

Hygroscope, instrument used to indicate whether the air is more or less moist. It gives no indication as to the quantity of moisture present. Its action depends on the property which organic substances have of clongating when moist and contracting as they dry. On one of the most common forms, a male and female figure are so suspended (by catgut) with reference to the doors of a toyhouse that when the air is moist the man comes out of one door while the woman goes in at the other, the converse taking place when it is dry. As these Hs. only indicate the humidity of the atmosphere they are moved by a weather change and are therefore usually behandhand with the state of the weather.

Hyksos, or 'shepherd kings,' a people from the k, who conquered kgypt 'with out a bittle,' destroyed her cities and temples, and reduced the inhabitants to shape . Monathe and other with the state of slavery Manetho and other authoritieon the last, of Egypt place the arrival of the H. at the end of the twelfth dynasty, and their expulsion at the beginning of the Och centh dynasty. The Egyptians were not by nature warlike; they were lovers of home and of peace; necessity at times of none and of peace; heressity at times drove them to extreme, but the whole nature of the country was 'to live and let hive 'This lack of multary spirit must have caused the yoke of the barbarian to he very heavy; it had, however, the as stud effect upon the country. At the final expulsion of the H., when the I gypta us at last rose and learnt to combue, n. fate was vile enough for the barbarian, and no Egyptian who was abe-to bear aims ofused to chist. Of the many theories concerning the H., one assumes that, after the downfall of the thuteath dynasty, a confederation of senate tribes from the E. Syrian desert engrated into the Delta during the internal trouble of the country, combined, and then assumed the mastery of Lower Fg.pt. It is a more attractive theory to believe they were non Semitic, and may have been related to, or formed part of, the Kheta or Hittite people (4.1.) These II, having estab, themselves, elected a king called Salatis, who reigned at Memphis and made all Egypt trib to him. The read fortress at Avaris in the Sethralte none or dist. E. of Bubrsts and close to Tans, became their stronghold. Josephus gives us a few names of the H. king., such as Salatis, Beon, who succeeded him, Apichnos, Apophis, Jonias, and Assi-Another king, Apoph. or Apopa I., whose name is inscribed on a granite slab at the temple of Bubastis, appears to bave tried to suppress the worship of the auct. gods of Egypt and struggled to force the county to pay homage to Set (the wicked one). A king Khyan, whose headless statue was found at Bubastis. come to have spread his authority widely, and been either known or recognised as far as Bagdad, and also at Choss 's in Crete, where his name occurs on the 1 of a jar. The scarubs of the H. have been found chiefly at Tell-el-Ychudiych. Their rule in Egypt may Ychudiych. Their rule in Egypt may have lasted 500 years, or, as other authori-ties say, 100 years. Correct dates are still impossible to obtain. See R. M. Engberg, The Hyksos Reconsidered (Or. Inst. Univ. 1

The Hyksos reconstacted (Or. Inst. Univ. Chicago Studies 18), Chicago, 1939.

Hylas, in Gk. mythology, a youth who was a favourite of Alkestia (Hercules), and who was abducted by the Naiads, who fell in love with him while he was drawing water from a fountain in Mysia.

Hylobates, name of a genus of manuals belonging to the Primates, family Anthropomorphide or Simildee, and commonly known as the gibbons. II. syndaetylus, known as the gibbons. H. syndactylu the siamang, is the best-known species.

Hylomorphism, see under Scholastic-

Hylton, or Hilton, vil. in the co. of Durham, Fing. It stands on the R. Wear, about 3 m. W. of Sunderland, and the people are engaged in shipbuilding and the manuf. of iron goods. Pop. 3000.

The word was em-Hymns (Gk. 1 µ104). ployed among the Oks. to denote songs or poems in honour of gods or of heroes, or composed for some special occasion, and in treece the number of II. was legion. Hesiod, Homer, Pindar, Euripides, all make use of the term and testify to the frequency with which the compositions are used. Oldest among these are the Homere H., a series of brief addresses to the gods. Among the latest pagan Gk, productions are the Orphic H., which deal with the rates of initiation into the Hellenio mysteries. In considering the question of hymnology from a Christian point of view, however, the early Heb. poetry is especially valuable. It shows, indeed, the greatest heights to which religious pootry had risen before the beginning of the Christian era. The unique position which the Davidic podier has ever held in the worship of Christendom shows the recognition of this fact by all nations. The last great pound eyes and sev, occell on the crown. The larve are cruciform and have a distinct head. There are over 30,000 species of H., which are grouped into two suborders, the Sessiventres and the Petiolata. To the first belong Tenthredinide, the saw-flies; Siricides, the wood-borers, etc. The Petiolata comprise the series Parasitica, with Cympidee, the gall-wasps; the song of the Blessed Virgin Mary (Luke i. 46-55), 'My soul doth magnify the Lord,' have been used daily in the choir offices.

As we consider the question of Christian As we consider the question of Christian hymnody, it will be well to begin with a definition, that of St. Augustine of Hippo: A H. 'is singing with the praise of God. If you praise God and do not sing you atter no hymn. If you sing and praise not God you utter no hymn. If you praise anything which belongs not to the praise of God, though in singing you praise, you utter no hymn.' This definition gives the distinction characteristic to the H. which

distinction characteristic to the H. Which belong to the four centuries preceding it.

Eastern Hymnody. The preface to the hymnary of the Mozarabie Breviary tells us that as Christianity itself came from the E., so also did the custom of hymnsinging. The words of Pliny, in the famous letter to Trajan (c. A.D. 110), carry us further then this by showing at how us further than this by showing at how early a date the custom was estab. in Bithynia. Early (ik. H. must be divided into two classes, the first consisting of those written in the rapidly dying classical metres, the second, and more important, metros, the second, and more important, of H. written in a more Oriental and often Hebraic type. Το the first class belongs the oldest of a.. ('histiph H., the Στομοι πώλου δουν, ascribed to Cloment of Alexandria. This H. is simple and childlike, containing nothing but what could be found in the pages of Scripture. higher mystical level is shown in the H. of St. Gregory of Nazianzus (also classical in form) in the fourth century, dealing chiefly with the doctrines of the occumental symbol and the contraction. chiefly with the doctrines of the occument-cal symbol and the contemplation of the Most Holy Trinity. Trans. of all may be found in A. W. Chatfield's Songs and Hymns of the Earliest Greek Christian Poets (1876). To the same school belong Synesius (375-430), Sophronius, and St. John of Damascus. Of all their works only three canons by St. John of Damascus have mentioned an unice in the Gik service. have received a place in the Gk. service-books. The later Gk. H. are to be found chiefly in the various church service books, viz. the twelve vols. of the Menaa, giving the Prayer of Saints; the Greater Octachus or Paracultier, containing the Ferial office; the Lesser Octochus, containing the ordinary Sunday services; the Triodion (Lenten season); the Pente-Triodion (Lenten season); the Pente-costarion Charmosynon (Easter and Pentecost); the Euchologion, containing the occasional offices; and the Horologion or Hours of Prayer. These books contain a vast number of H. of which the best selection is to be found in Christ and Paranikas's Anthologia Greea, etc. They are best known in England by the trans.
of J. M. Neale, of which mention may be
made of 'Christian, dost thou see them?'

which are, unfortunately, almost unknown in the W. The names of Bardesanes (Bar-Daisan, b. 154), and Ephraem Syrue (d. 378) must be mentioned. The H. of this writer still hold an important position in the service books of the Syriac churches. Latin Hymnology cannot be traced further back than the beginning of the fourth century, the earliest name with which any H. can be connected being that of Hilary of Poitiers, of whom Isidore of Seville says that he was the first who flourished in composing hymns in verse. Bours and in composing hymns in verse. Sev. if. in the Mozarabic Breviary are ascribed to him. Contemporary with Hilary was Pope Damasus, to whom two extant II. are ascribed, but the real founder of Lat. hymnody comes somewhat have. hater. This title is unanimously given to St. Ambrose (d. 397), to whom a large number of extant H. is attributed. The twelve which the Benedictme editors give as genuine include some of the best known office II. Among then are 'Æterna christi munera' (The eternal gifts of Christ the King), for apostles and evangelists, 'O Lux beata Trinitas' (O Trinity of blessed light), Saturdays in Trinity, tide; and 'Splendor Paterne glorin' (O splendour of God's glory bright), Mondays from Epiphany to Lent. From the fourth to the eleventh century From the fourth to the eleventh century we have a regular stream of religious poets and hynn-writers, mostly of considerable merit. At the end of the fourth century comes Aurelius Clemens Prudentius, a Spaniard, from whose poems many of the Ferial H. (e.g. Lux ecce surgit aures ') were taken. But his best-known H. is that for the Nativity, 'Corde natus ex parentis' (Of the Father's love begotten). In the fifth century we have the layman In the fifth century we have the layman Scullins, the author of the well-known Christmas H., found in almost all the breviaries. 'A solis ortus cardine' (From east to west, from shore to shore). The latter part of this, 'Hostis Herodes imple' (Why, impious Herod, should'st thou fear 'I), forms the office H. for the Epiphany. Venantius Fortunatus, histop of Pauters (d. c. 609), is far letter known. Portiers (d. c. 609), is far better known. To him belongs the glorious Passiontide II., 'Vexilla Regis prodeint' (The Royal banners forward go), and 'Pange lingua gloriosi' (Sing, my tongue, the glorious battle), both of which occur in the Ron. battle), both of which occur in the Rom. Breviary, but in a mutilated form. St. Gregory the Great, from whom the Gregorian melody takes its name, wrote much, but is less known. Some twelve H. are attributed to the one Eng. Father, the Venerable Bede (673-735). In the next century Fulbert of Chartres wrote the triumphal Easter H., 'Chorus nove Hierusalom' (Ye choirs of New Jerusalom' From the eighth century dates also the 'Urbs heata Hierusalom' which became the H. throughout Europe for the made of 'Christian, dost thou see them I' Hierusalem' (Ye choirs of New Jeruste, Andrew of Crete, 660 c. 732), 'Tis the day of Resurrection' (St. John Damascene), 'Jesus, Lord of life cternal' (Joseph the Hymnographer), 'Jesus, Rame all names above' (Theoctistus of the Stadium). But numbers may be found in any modern hymnal.

Syriac. From the second century until almost the close of the Middle Ages, the churches of Syria, Mesopotamia, and W. Persia produced many excellent H.,

such H. found a place in all service books. The next few centuries are important for the spread of the Sequence, a H. sung before the Gespel at Mass, which was developed from the Alleluia by Notker of St. Gall (d. 912). The greatest of the medieval sequences, however, is the 'Dies ira', dies illa '(Day of wrath, O day of mourning), the authorship of which is ascribed to Thomas of Celano, the friend of St. Francis of Assisi.

ascribed to Thomas of Celano, the friend of St. Francis of Assisi.

English Hymnody.—It would be possible to trace the beginnings of Eng. hymnody to the time of Cædmon (seventh century), but this would lead us by too long a path. It will be well to take the hist, up at the Reformation. When the trans. and adaptations of the old service trans. and adaptations of the old service books were made for the new Book of Common Prayer, it was Cranmer's intention that the old H. should be trans, likewise. But he had not himself the poetic ability for this task, and the work remained undone until the nioeteenth century, when sev. trans. of the whole body of the anct. sarum H. were made. During the two centuries that followed During the two centuries that followed the beginnings of the Reformation there was no book of H. for use in the ling. Church. In the Prayer Book itself there was but one trans., that of the 'Veni, Creator' in the Ordinal. Their place was taken, however, to some extent by the metrical paraphrases of the Psalms. Intil almost the end of the seventeenth century the most popular was the version by Sternhold and Hopling, commonly known as the 'Old Version.' This later gave way to the 'New Version' of Tate and Brady. Sev. from this latter work still find their place in humals, such as, for example, the H. 'As pant's the hart for cooling streams.' In 1623 appeared George Withers's Humma and Songs of the George Withers's Hymns and Songs of the Church, the first attempt at a compre-hensive hymn-book, but it never secured any measure of success. Many excellent H. were written also by Bushops Taylor and Ken. But the first hymn-book defi-nitely designed for use with the service of the Church of England appeared in 1737, with the title Collection of Psalms and Hymns. It was compiled by John Wesley, chefly from the writings of Isaac Watts, and pub. at Charlestown in Georgia. Two years later came the olicial founda-Two years later came the official foundation of Methodism, and all later eds of the book must be classed as Methodist. The next step was taken by M. Madan, who in 1769 pub. A Collection of Psalms and Hymas extracted from various Authors, etc., containing 170 H. It is noteworthy that during the rest of the century all the church hymn-books that appeared were built on the foundation of the various Nonconterpist collections, and that no Nonconformist collections, and that no great hymn writer arose within the church until the production of the Olney Hymns by Newton and Cowper. At the beginby Newton and Cowpor. At the beginning of the unneteenth century there was
a great outburst of hymn-writing and
collecting, which had seen considerable
advance even during the first twenty
years. The productions of this period
are characterised by a striving for uniformity and harmony with the Book of

Richard Rachard Ra

Common Prayer, and by a desire to secure official recognition which presents the later general return to the old Gk. and Lat. H. and their trans. Meanwhile, the thirty years which bring us to the middle of the century saw an even greater increase in the number of hymn-books produced. Seventy-four of these are quoted in Julian's Decionary, and these are but a selection of the most important. Bishop Heber's Hymns (1827), containing the hymns of H. H. Milman, was an extremely influential collection, and E. Bicker-steth's Christian Psalmody (1833) was also important. This last was supplanted by the Human Companion by the Rev. E. H. Bickersteth, son of the above-named. The influx of these H., more definite in doctrine and more robust in style, led to a gradual exclusion of the Nonconformist and Calvinistic element which had hitherto bulked so large. Moreover, the standard of religious poetry had over, the standard of reinfood poerry has been raised considerably by the influence of Keble's Christian Year. The Hymnal Noted of 1852 and 1854 confined itself enlirely to Lat. hymna, their excellence being enhanced by the beauty of Neale's trans But the hundredy of hymnals which had now issued from the press had left Kra hymnals are the controlled. left Eng. hymnody in great confusion, and this resulted in the pub of Hymno Accept and Vodern). 1861, a collection which at first contained only 130 H, but which rapidly increased in size and in popularity until it almost entirely supplanted all other collections. At the beginning of the twentleth century sev new hymn-books, all aiming at a higher level of scholarship, were produced. The most important of these are the English Hymnal (1906) and the Oxford Hymnal (1903).

Ayanau (1905).

Nonconformist Hymnody,—The Baptists long resisted the practice of singing II. Then first hymn-writer was B. Kuch, about 1673. The names of J. Stennet (1663-1713), S. Stennett, grandson of the former (1728-95), and W. Noel (1799-1873) are also worthy of mention. Both the Particulur Bantists and the Both the Particular Baptists and the General Baptists now have official hymn-books. The Congregationalists have produced many hymn-writers of great merit. Greatest of these is I-suc Watts (1674– 1715). The names of Philip Doddridge 1715). The Bailes of Fluid Foodstage and Josiah Conder are also well known. In 1859 was pub. officially the New Congregatumal Hymn Book. Since that date, however, sev. other Congregational hymnals have been issued. The greatest nonever, sev. other Congregational hymnals have been issued. The greatest hymn-writer of Methodism is Charles Wesley, to whom sev. thousand H. of varung merit are asseibed. Many of them are among the most popular of H., both in the Church of kngland and among the various Wethodist bodies.

among the various Methodist bodies.

Mention may now be made of the H. known as carols. The word was originally applied not to a song, but to a dance. The song was later added, and the name included both. Finally the dance was dropped, and the song retained the name. Carols, secular and religious, both in the vernacular, were very popular during the

in and out of church. Their hist, is especially connected with the miracle and mystery plays. Odd scraps of Lat, which seemed to link these popular songs to the liturgical service of the church are frequently found in them. From the frequently found in them. From the Reformation to the nineteenth century we have almost an entire blank in the hist. of the carol. Then collections of modernised versions of the old carols were made and new ones were written. To this period belongs (look King Wenceslas, by J. M. Neale. The most popular collections are those by Chope and Woodward. See J. Julian, Dictionary of Hymnology, 1892 (last ed., 1907), to which this article is much indebted; J. M. Neale Hymns of the Eastern Chusch, 1863; J. Pauly. the Eastern Church, 1863; J. Hyndman, Horn; "3yers (1842-1921), Eng. socialist leader; b. in London; eldest son of John Beckles H., barrister, Educated privately, and graduated at Trinity College, Cambridge. He travelled widely and occupied birpself with learnal.

widely and occupied himself with Journalwidely and occupied himself with Journal-istic work. In 1881 he founded the Social Democratic Federation. He was always an active agitator for social romedies, and in 1887 was tried with John Burns and others at the Old Bailey in connection with W. End roots, but acquitted. In 1911 the Social Demo-cratic Federation was proved in the But cratic Federation was merged in the Brit. Socialist Party, with H. as chairman. This new party split into fragments during the First World War—most members joining the Communists; and in 1920, under H.'s auspices, the S.D.F. was revived. Among t his numerous pubs. are: Indian Policy and English Justice (1874). England for All (1881), Historical Basis of Socialism in England (1883), Socialism and Slavery (a reply to Bar, Socialism and Slavery (a reply to Borialism (1896). See R. T. Hyndman, of Socialism (1896). See R. T. Hyndman, The Last Years of Henry Mayers Hyndman, 1923.

Hyne, Charles John Cutcliffe Wright (1866-1941), Eng. novelist and traveller, b. at Bilbury, Gloucestershire, son of Rev. Charles Wright Noble H. Educated at Bradford Grammar School and Cambridge. Travelled widely in search of literary material. His most popular story is Adventures of Captain Kettle (1898), which Adventures of Capitain Nettic (1818), which appeared in the B indson Magnetine. Other stories include The Lost Continent (1900), Mr. Harrocks, Purser (1902), Thompson's Propress (1902), Red Herrings (1918), People and Places (1930), My Joyful Life (1935), Steamboatmen (1942) and various sequels to the Adventures of Capitain

tongue, to the muscles of which it gives attachment. It consists of a more or less rectangular body (bosihyat), and two pairs of unequal cornua or horns; the greater curve upwards and backwards; the smaller allers the in learning the consistency. the smaller, about ; in. in longth, are attached to the bashyal near its junctions with the great cornua.

Hvoscian and Scopolia carnolica, etc.

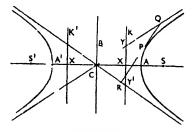

Hyoscyamine, poisonous crystalline al-kaloid, obtained from henbane (q.r.). When moist, it has a stupefying odour; when moist, it has a stuperying odour; it is used as a sedative and as a negleratic. It is found occurring with hypocine, is an alkaloid C₁₁, H₁O₁N. It is an optically active form of atropine, and has a mydratic action on the pupil of the every the state of 270 (11). Complements (270 (11))

Hypatia (c. 370-415), female philosopher and mathematician, daughter of Theon, b. in Alexandria. She lectured for a tune in her native city, and then became the head of the Neoplatonic school there. Her deep erudition, sound judgment, and the elecution gained for her the admiraone clocution gained for her the admiration of all her hearers, and her house became the resort of men of learning and distinction in Alexandria—amongst others, Orestes, the prefect of the city, with whom she was accused of being too intimate, and was barbarously put to death by a mob of savage Mitrian monks. For the little authentic knowledge about H., see Sociates, Hist. ech unstica, vil. 15. See also C. Kingsley, Hippatia (novel), 1853; R. Asuus, Hyprica in Tradition and Dichtung, 1907. Hyperesthesia, excessive sensibility of the nervous system, due to diseased con-

Hyperesthesia, excessive sensimity of the nervous system, due to diseased conditions: it is particularly characteristic of hysteria. The sensory nerves are extremely sensitive to the slightest impressions, and may react writent the presence of any external stimulus at all. It is sometimes induced by rheumatism, conting or any agents nervous compliant. sentica, or any acute nervous complaint. The treatment involves rer oval of the cause; local applications of heat, cold, or electricity often afford temporary relief.

Hyperbola, plane figure obtained by cutting a right circular cone by a plane inclined to the horizon at an angle greater than that of a generating line (see GRO-MURY). Hence it is known as a conic section. It is a symmetrical figure of section. two branches, each extending to infinity.
Any point on a H. is such that its distance from a fixed point, known as the jo us, always bears a constant ratio to its distance from a fixed straight line called Mr. Harracks, Purser (1902), Thompson's distance from a fixed straight line called Propress (1902), Red Herrings (1918), the directrix: and this ratio, which is People and Places (1930), My Joyful Life (1935), Steamboutmen (1942) and various sequels to the Adventures of Caplain Kettle which continued until 1938.

Hyold Bone, U-shaped bone lying immediately above the thyroid cartilage of the larynx, and near the root of the conjugate axis. C, the middle point of SS¹, is the centre, and A, A' are the vertices. The straight lines CY, CY' through the centre, known as asymptotes, gradually approach the curve, but actually only meet it at points infinitely distant If the tangent at any point P

HYPERBOLA

on the curve cut the asymptotes in Q and R, the area of the triangle CQR is the same for all positions of P An H is thus same for all positions of P. An H. Is thus sometimes defined as the envelope of the line which forms with two given straight lines a triangle of constant area. In ana lytical conics the equation of an H re ferred to its axes is $\frac{1}{a^3} - \frac{y^4}{b^2} - 1$, and referred to its asymptotes is $xy - e^x$. When the asymptotes are at right angles to one another, the H is called rectangular

Hyperbole (1 - eppoly over-hooting, excess) figure of rhetoric which hewithout deceiving 'It consists of exagger ated and extravagant statements used through excitement or to express strong through excitement or to express strong feeling and arrest the attention and not intended to be taken literally. Formal confilments are often Hs. They form the basis of many metaphors and occur frequently in high flown or poetic lan guage. The exact opposite is Litotes, or

Hyperboloid, name given in solid geo-metry to two surfaces belonging to the general class of controlds which in threedimensional analytical geometry are represented by equations of the second degree in r, y and z. The two forms of Hs are known as the H of one sheet (shown in the figure) and the H of two sheets. The simplest forms of their equations are respectively $\frac{x^1}{a^1} + \frac{y^4}{b^2} - \frac{z^2}{c^3}$ = 1 and $\frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{a^2} = 1$ Both may be generated by a variable ellipse moving parallel to itself, and both are intersected by three mutually perpendicular

planes in two hyperbolas and one clipse The H of two sheets is formed by two distinct surfaces extending to infinity, and each is touched at infinity by an asymptotic cone, in the same way as the hyperbola has two branches and a pair of

a ymptotes. The H of one sheet is a ruled surface, and is such that through every point of it two straight lines, called generators may be drawn so as to lie wholly on the surface. It may also be defined as the locus of the intersection of corresponding planes of two homographic pencils of Tlanes

Hypnotism, condition of artificially induced sleep, or trance resembling sleep, in which a patient is rendered more sus-ceptible to suggestion. It includes the series of phenomena which from time to time have been termed animal magnetism, mesmerism, induced somnambulism, ody-

lic force, etc.

History. From time immemorial forms
been known. e g of H. appear to have been known, eq or H. appear to have been known, e.g. certain states of ecstany which are more or less self-induced in types of fanatics are related to H., and while affected, the individuals appear capable of resisting what would be pain and fatigue under the control of the c normal circumstances. Definite investigations of the state have been made since the sixteenth century: Paracelsus at the ond of that century estab. to his own satisfaction the existence of a sympathetic system between the human and the stars and other objects. Gassner, a Rom. Catholic priest of Swabia, in the middle of the eighteenth century stated that disease was due to demoniacal possession, and that a supernatural power with which he claimed to be invested, could be used to expel all forms of disease. In 1774 Mesmer, a Vienneso physician, gained a large measure of success in the treatment a large measure of success in the treatment of certain disorders. He proceeded to Paris in 1778, and by continued successes he gained a large following, and his suggestion of the actual transference of a 'magnetic fluid' continued in vogue until within quite recent times. His treatment within quite recent times. The treatment onecessitated much apparatus, magnets, connecting whrea, etc., with usually a central tub of water or other liquid round which the patients were seated. A pupil, Marquis de Puységar, m 1780, proved that the accessory magnets, etc., were un-necessary, and the claims of 'mesmerism' became so insistent that a Fr. commission was appointed in 17% to investigate the matter fully. Their report was un-favourable, and this, coupled with its later association with the notorious Cagliostro, brought it into disrepute. 1831 Bertrand estab the affinity of magnetic sleep to somnambulism, and suggested its use as a therapeutic agency, and a second Fr. commission of that year reported rather more favourably. In 1841 Dr. Braid, a Manchester physician, discovered that a subject could be endiscovered that a subject could be en-tranced by gazing at a bright object, and he suggested the name 'hypnotism,' from tik. 1710c, sleep. On the Continent schools of H. were e-tab. under the direction of the distinguished physiologist, direction of the distinguished physiologist, Richet of France, and such physicians as Charcot (Salpātrière), Liebault, Bernheim, Prever and Heldenhain. In Britain Dr Elliotson (editor of Zoist) supported II., and his advocacy resulted in his being driven out of the profession. But the discovery of ghloroform in 1818 meant the prosession of an angesthetic of wider the possession of an anathetic of wider the possession of an ann-thelic of wider application and more certain results, and, in consequence, H. tended to become neglected. In 1882 Mr. Gurney carried out investigations in the subject, and the Brit. Medical Association, after a long period of doubt and vaciliation, reported favourably on its use in 1892. The

names of Drs. Bramwell and Tuckey are associated with valuable work, and in 1907 the Medical Society for the Study of Suggestive Therapeutics was founded.

Wethods. The usual methods employed to bring about the hypnotic condition are either (a) peripheral, as in the gazing at a bright object so placed as to cause some slight muscular eve strain, flashing of mirrors, slow, monotonous 'mesureric' passes, and even the ticking of a watch in very sensitive persons; (b) central stimulations as by verbal suggestions. Frequently there is a combination of these methods (Braid and Bernheim) as when the operator places a bright object slightly above the level of the subject's eve, and suggests to him the idea of sleep, at the same time making hand passes petere the face. It is found in practice that about 90 per cent of persons are sus-ceptible to H., and the proportion always appears to be higher in individuals trained to obey, e.g. soldiers, salors, school children, etc., than in others, though it bears little relation to age, sex, or intellibears little relation to age, sex, or intili-gence. Liebault had some 1700 successes in 1756 persons treated. Bramwell had but two failures in his first 500 subjects, and no less than 240 became sommam-bules. The persons who give exhibitions of H. on the stage are in reality not specially gifted. It is quite possible for a psychatrist to induce equally profound hypnosis, but lighter stages are more suitable for purposes of healing. Many animals, e.g. cats. dogs, lizards, croco-diles, etc. can be hypnotised. diles, etc. can be hypnotised.

There are three

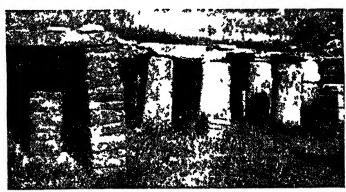

Symptoms. There are three well marked stages of hypnosis: (1), slight, in which the voluntary muscles are affected, without loss of consciousness in the patient and without amnesia on re turning to the norm il condition ; (?), deep, in which the symptoms very greatly; the sensory system is affected, there may be tonic contractures of the muscles (induced catalepsy of Heidenhain), or marked flexibility; there is frequently an increase of muscular strength, or a maintenance of an ankward attitude without muscular fatigue, there may be paralysis of one side, or one organ, by open or overt sug gestion, or suggestion may be used to cance alterations of sensation. Visible symptoms include: change in pulse beat and in rate of respiration, dilated pupils, drooped cyclids, protriding evelodis, and frequently flushed face and highly increased perspiration. This stage is usually marked by amnesia on waking, though a second hypnotic state will generally contain memories of the first. No satisfactory explanation has been given of post-hypnotic suggestion by which the subject can be made to carry out some action (not foreign to his nature) after the lapse of a given interval, as for example, the hypothed person may be told to write his name, note the time, purchase some article, etc., after the expiration of, say, 5000 mins,, and although on waking be may have no cognition of the command, yet punctually to time he will endeavour to carry out the suggestion, usually doing

claims of its early exponents. There is no doubt that II can be made to yield sleep without the use of drugs, which of tiself is a valuable property, and during this sleep the subject is peculiarly open to suggestion so that definite advantage follows its use in cases of blindness, loss of speech, hysterical paralysis, etc. Pain can be relieved, e.g. during childbirth or surgical operations (see above). Its use Its uso

so with some more or less plausible explanation. The third stage is somnambulism, in which the subject rarely makes any response to suggestions this conditions can seldom be reached during the first experiments with a new subject Uses—Although H is extensively used, yet the trutment does not fulfil all the claims of its early exponents. There is no doubt that II can be made to yield sheep without the use of drugs, which of 1918. 1918

Hypo, popular name for the chemical substance used in developing photographic nightives, commonly known as hyposulphite of soda, the correct name is thiosulphate of soda

Hypocaust, arrangement used by the Rome for heating their baths and villas

Journal of Hellense Studies

A HILOULUST

has been treested as an educational Their mace (hypocausis) was placed below agent even in the Centineut, for the resulting room to be heated and the H was a somany, muphinoments, etc. It sometimes positic by H to produce alteration in unconscious attitudes under lying psych legical amptoms (with dis appearan c of the symptoms) and mental analysis may often be expedited by th use of H (Hypn) in dys(s) I vaggerated tatements have been ear ulated as to the extent of central consequent on H and experim of show that it is extremely difficult in n any asset impossible to in duce an individual to carry our actions which are normally abhoreent to bus char acter, i. Il cannot make a normal indi-vidual carry out a climinal can paign, though an unb danced or permetous mind may be rendered criminal
Theories - Numerous

theories been advanced but the nature of the H state is still uncertain. It has been con-sidered (amongst other theories) to be (1) an abnormal state of the bruin, (2) due to a temporary abolition of some cortical functions. (i) a psychoneurosis, allied to I trade

the reom to be heated and the H was a blow space under the 'caldainm,' where formation of circi mais as it has been been by low space under the 'cald minn,' where claimed that considerable improvements it has all under the walls and the new have followed its appliention in dip list it under cound the walls and to other is by means of pites and passages nerh)

> Hypochlorous A id (II(IO) is only wn in aqueous solution and may be It ined by distilling bleaching powder with illute nitric 1 if or by dissolving ill rine monoxite in water. The solu ti n obtained his a peculiar 'chlorous' il, and strong blacking properties, the being really resolved into hydro me acid and overen Its salts, the ne acid and oxygen by chlorites, are almost unknown in the r state, and are obtained, together will the chlorides then chlorine is passed n to a cold solution of the hydroxide of an its it or alkaline earth. Bleaching powder (11) or 'chloride of lime,' is prepared by 11 ing chi rine, or r slaked lime, and consists of a maxime of calcium hy por hloride. the Ca(OCI), 4H₂O with basic calcium chloride, Ca(1, Ca(OH)₂, H₂O—roughly equivalent to Cy(Ot DCI It is used in luge quantities for bleaching in the textile With small quantities of acid.

Eau de Javelle, formerly much used for bleaching, consists of a solution of potassium chloride, KCL, and potassium hypo-oblorite, KClO.

Hypochondriasis, name obtained by its supposed connection with the hypochondria regions of the abdomen (q.r.), a mental illness causing disorder of digestive and bilary, and often other, functions. It is characterised by palpitations, extreme sensibility, morbid feelings that simulate disease, and great uneasiness about the health. In extreme cases it develops into melancholia. It is more frequently met with amongst the rich than the poor, and the best cure consists in physical and mental exercise, and interests outside oneself, or psychiatric treatment in severe cases.

Hypodermic Injection (ὑπό, under, δερμα, skin), introduction of a drug be neath the skin. It is effected by means of a hypodermic syringe, which is armed with a sharp hollow needle, so that the with a snarp notion needle, so that the tissues underlying the skin can be reached without much inconvenience to the patient. The advantages of H. I. are that a drug can be introduced more directly to the tissues than by way of the directly to the disates than by way of the stomach, the quantity required is there-fore less, the treatment can be made local if required, and the operations of a possibly deranged stomach are not further interfered with. The method is used chiefly in connection with the group of drugs known as alkaloids, notably morphia and cocaine.

Hypogeum, underground chamber anciently used as a burial place, storage room, or dwelling place. In archaeology room, or dwelling place. In archaeology the term is restricted to the first of these. various types are found: dug from the earth; cut from rock, as were the Rom. oatacombs; or constructed of masonry,

as at Mycone.

Hyponitrous Acid (H.N.().), colourles, crystalline substance, soluble in water, readily decomposing (often explosively) into nitrous oxide and water. Its salts, the hyponitrites, are formed by reduction of the nitrites by means of sodium amai-The silver salt is a yellow insoluble gain.

substance.

Hypophosphorous Acid (H₁l'O₁), colour-less cry-tailine compound, melting point 27° C., formed by the action of subpuric acid on the barium salt, which is obtained by boiling phosphorous with a solution of baryta. On heating strongly, II. A. is decomposed into orthophosphoric acid and gaseous phosphoretted hydrogon. It is a powerful reducing agent, precipitating gold, silver, and mercury in the metallic state, and copper in the form of its hydride, from solutions of their saits. The hypophosphites are largely used in medicine as tonics.

Hypophyll, see BRACT.

Hypostasis (unogradus, subsistence), Gk. term meaning substantial existence, much used in the Trinitarian controversies of the fourth and fifth centuries. At first used as equivalent to ovoia (divine essence), its meaning in theology has

H. A. is set free from hypo-chlorites, and changed considerably. It was regarded with larger quantities chlorine is evolved. as synonymous with $\pi\rho\sigma\sigma\omega\sigma\sigma\nu$ or persona as synonymous with πρόσωπου or persona (person) at the council of Alexandria, A.D. 362, and is used to denote the distinct A.D. 302, and is used to denote the distinct personal existence of each Person in the Truitv. Sec G. P. Fisher, History of Christian Doctrine, 1896; C. G. Harnack, The History of Dogma (iv.), 1898.

Hyposulphuric of soda, see Hyro.

Hyposulphuric Acid, obtained by dissolving zine in a solution of acid sodium whights. It is a strong blooching areast

sulphite. It is a strong bleaching agent.

Hypothec, in Scots law, a security over any part of a debtor's property, the property being allowed to remain in the possession of the debtor; hence distinct from both a mortgage and a pledge. The idea is borrowed directly from civil law (q.r.), but in practice Scots law allows of few IIs. Hs. are either implied (legal Hs.) or based upon express contract (conventional Hs.). The latter class is restricted to bottomry (q.r.), and respondentia (q.r.) bonds. The former includes the Hs. of (a) a landlord over movables (invecta et illula) brought on to the leased premises, for rent current and due (but not for arrears); over produce and perhaps machinery and implements; for royalties payable under a lease of minerals; and over crops for current feu duties due in respect of agric. land; (b) a law agont over his client's writs and title deeds, for his expenses (properly a lien), and (c) of seamen, who have a tacit H. over the ship, and the freight due to the shipowner. for their wages; of a shipowner over the cargo for freight due, and of cargo-owners over the ship for loss by improper owners over the snip for loss by improper stowage. Generally speaking, the creditor enforces his security by getting the subject of the II. assigned to him. So Abbot, Shipping (14th ed.); (Hoag and Irvine, Rights in Security.

Hypothesis (vnotices, foundation), in general, a supposition, proposition, or principle assumed as true for the purpose of argument, in order to draw concusions or inferences for proof of some point in question, or to account for some occurrence. In science a conjecture or tentative theory adopted provisionally as a conjecture of the confidence o guide in investigating phonomena. If this conjecture is found after careful tests and examination entirely satisfactory in explaining the phonomena in accordance with known facts and principles, it is accepted as a scientific theory. See E. accepted as a scientific theory. See E. Naville, La logique de l'hypothèse, 1880; Logic text-books by W. Jevons, B. Bosanquet, H. W. Joseph, W. Jevons, Principles of Science, 1874; H. Poincaré, La Science et l'hypothèse, 1902 (trans. 1903). Hypsipyle, daughter of Thoas of Lemnos, in Gk. legend. The saved her father when the women of the 1st slow all the rest of the men. When the Acqueryle landed

When the Argonauts landed of the men. When the Argonauts landed and united with the Lemman women, H. bore Jason twin sons. Driven from Lemnos when her fathers' escape was discovered, she became the nurse of Opheltes, son of King Lyourgus of Arcadia. While directing the heroes of the slege of Thebes to a spring in the Nemean forest, she left her charge, who was killed by a sorpent, The funeral games instituted for Opheltes were the origin of the Nemean games

Hyracotherium, name of the best known form of Hyracotheriid t, a family of exime t ungulate mainmals belonging to the order Perissodactyla and considered to be the ancestor of the horse. The fossil form is confined to the Locace strata of Europe and \ America and shows a small animal 1 ft or so in length, with 1 complete dentity in a well marked corn-cold process on the shoulder blude, four digits on the forchinds and three on the hind limbs, and orbits not enclosed by bone the radius and ulna are separate as also are the tibu and fibula

Hyrax, genetic name of certain and topices of man mala forming the order Hydricolder, I regard is an arterative term. The eminutes are popularly known as concy and somewhat is emble rodents in appearance owing to the long, rodents in appearance owing to the long, curved, front tecth, adupted to grawing, the short errs and reduced that in the structure of the molar teeth, however they are notice the impulate. Hysteria I hat form of neurone illnesm win h organic discuss 5 im lated for the sake of some gern win h the illness times modering megablem, fulfilling in wish or satisfy its measure either mr dity or in phace y The symptoms dinost any or, in diseas; may be sufficient i il knowledge to reproduce sympton for organic illness, with fidelity 1 example hysterical I s of kin sensut it is often confined to te glove and sto ling area, a distribu n which does not correspond to the citemical arian ment of cutaneous stes. As medical knowledge spreads, grosser hystered a unifestations such 111165 the, wide-pread | maly-calete grow less t quent, and less definite complaints on has heads, her in i dizziness are more fi quently encountered Loss of memory is often hystorical and patients may winder from home in trance-like states The patient is never clearly aware of the motive underlying his illness, but the

extent of the self-deception varies and all | transitions between hysterical reactions

and malingering occur.

Hysterical reactions are more common in women than in men and often occur at puberty and in adolescence. They may follow accident, particularly where there is a question of compensation and where the underlying motive, unrecog-nised by the patient, is financial gain. Since the symptoms are psychogenic, treatment is by psychotherapy, which may be given in various ways. Individual hysterical symptoms can often be removed by suggestion (often effectively given with the help of hypnosis) but unless the underlying psychological problems are tackled, or the environmental stress diminishes similar of different symptoms are likely to recur. It may be necessary to alter a patient's environment, as for example by arranging for a child to go to a residential school, away from over-solicitous and fussy parents. Hysterical symptoms may clear up spontaneously when the patient's problems are solved. e.g., by the satisfactory settlement of a year. The beach and golf-course claim for compensation. In many cases line, but the sea's encrotehments manipulation of the environment is not destroyed the harbour. Pop. 8109.

enough, and a thorough investigation of the patient's life becomes necessary with the aim of helping him to understand and solve the conflicts or problems for which his hysterical symptoms are an unsatisfactory solution. See also Hypnotism; PSYCHIATRY: PSYCHOANALYSIS, See D.

K. Henderson and R. D. Gillespie, A tertbook of Psychiatry 6th ed.) 1944.

The term 'Hysterics' is not synonymous with H., but is a general term for uncontrolled emotional outboosts, often with screaming, solbling, laughing, strug-gling etc. Persons who have such out bursts may or may not be hysterical in the technical meaning described above.

Hythe (A.-S. port, haven), seaside tn. and resort of Kent. Parland, one of the Cinque Ports, on the S. Coast 4 fm. W. of Polke-tone. It is in the diocese of Canterbury and on the S. Region railway. The mrkt-house was rebuilt in 1791 and an old cruciform church—st. Leonard's—has been restored. The Brit. Army has been restored. The Brit. Army School of Musketry (now the School of Small Arms) has been here for many yeur. The beach and goff-course are tine, but the sea's encrotehaents have I, ninth letter of the Eng alphabet, 1901 called in Ck tota and in Senitic languages secon yodh In the North Semite alphabets and in early 6k it resembled a Z, later the symbol was straightened to 1. In the the symbol was straightened to I square field script, the part of the modern field script, the part of the modern field alphabet, the symbol came to be written with 1 very small sign, hence our words 'jot (f Mitthew, v 15) and jottings' httle notes. In early medical field of the symbol state of the symbol state of the symbol state of the symbol state of the symbol state. val Lat , was first written with a dot for sike of distinction with m the semite alphabets which were and still are consonantal scripts, it had the consonant value of y as in yet but in Gk and in its descendants it had the yowel sound y in I at it also denoted vower sound? In 1 nt it also denoted the conson int pronounced y although in 1 ng it received the value of j as in judge others in hid two sound the long or sliter, the former te sembling the sound of j as in machine. and in the continent il a often written in leng ec is in meet. Ibañez, Vicente Blasco (1867-1928), Sp. novelist and politicism, was b in Valencia. An ardent revolutionary reformer and ed stections from his works See E An artient revolutionary reformer and E. Vacherot. Historie critique de l'école d'Alexandrie, ii , 1851; A S Chaignet Instorie de la psychologie des Grees, v., Sp. Parliament. So disliked did he make 1893; T. Whittaker, The Neo-Platonists, liminself there that, solely to displace him, law that gave protection to members of the Cortes. At one time he founded, and for five years managed, an Amer. colony. The latter part of his life he spent in Paris, the centre of a revolutionary and anti-

Royalist group.

His earlier novels are by many considered his best—. 1rroz y Tartana (1891), Flor de Mayo (1895), La Barranca (1894), Cañas y Barro (1902), and Entre Naranos (1902). They are realistic in treatment, and describe lite in the tus., farms, and and describe life in the thst, farms, and fishing vils. of Valencia; they are full of life, colour, and brute force. His next group of novels—La Catadral (1903; trans. 1909), El Intruso (1904), La Bodega (1905), and La Horda (1905)—are political and sociological. In his third group—La Maja Dèsnuda Sangre y Arena (1908; Eng. trans. as Blood and Sand, 1913), Los Muerlos Mandan (1909), and Luna Benamor—he returns once more to his original style, but does not describe the original style, but does not describe the original style, but does not usering the same locality. His Four Horsemen of the Apocalypse (1916), was an immense suc-cess abroad, both as a novel and as a film. His later books were Marc Nostrum (1918), La Turras de Todos (1922), Alfonso XIII, Unmasked (192), and A Norelist's Tour of the World (1927). See C. Pitollet, Vicente Blasco Books, ses romans et le mann de same 1921. roman de sa rie, 1921.

Ibarra, cap. of limbabura prov., Ecuador, S. America, about 50 m. N.N.E. of Quito. Founded in 1606, it was almost destroyed by carthquake in 1868. It is a bishop's see, and has woollen and cotton

blshop's see, and has woollen and cotton mills. It stands at the N. foot of Imbabura volcano. A lailway connects I. with Quito. Pop. about 7000.

Ibbetson, Julius Caesar (1759-1817), Eng. painter. Though not of the first rank, he produced a few works of charm, and individuality, as in 'The Ascent of George Beggin in Lunardi's Balloon.'

effete puritanism and social prejudices of the Norwegian prov. life, in which his unthe Norwegam prov. me, in which is an impre early years were passed were rich material for the bitter satires on civilisa, tion with which he subsequently stung Europo into fury. His earliest work-Cathina (1850), was purely historical, and was inspired by his reading of Sallust and 378 Ice

there under the celebrated Heltberg he inhabs, are chiefly occupied in mining and associated with Jonas Lie, Vinje, Björn-in manufacturing tiles and bricks. Pop. son. Botten-Hausen, and others. Thanks | 5000. to Ole Bull, the violin virtuose, he became director of Bergen Theatre from 1851 to 1857, and wrote for his productions, but practically all the MSS, have since been destroyed, with the notable exception of destroyed, with the notable exception of the vigorous historical drama, Lady Inger of Ostrat. In 1857 he was appointed maneger of the National Theatre at Christiania. A year later appeared his first saga-drama, the splendid Harriors of Helyrland. The Preladers followed in 1864, and 1873 saw the completion of Emperor and Galilan, his greatest historical prose-drama. I., the cynic, pessimist, and iconoclast, made his debut in 1862 with Love's Comedy, eleverly written in epigrammatic verse. In the in 1862 with Lore's Comedy, cleverly written in epigrammatic verse. In the same style there followed Brand (1866), an attack on pietism, and Peer Gypt (1867) his most influential and popular dramatic poem, called by many 'the Scandinavian Faust.' It was, however, in the scathing Faust. it was, however, in the scathing satirical prose dramas which constituted his third period that the I. of European nis third period that the I. of European significance found mature expression. In the League of Fouth (1869), Pollors of Society (1877), and An Enemy of the People (1882), he attacked the whole fabric of modern politics—as he terms it, "government by geographical formula." It's studies in femiusm are of equal interest and power: Rosmersholm (1886) befor the best multipe Pull' March 1870: being the best, and the Doll's House (1879). in which he discusses the problems of modern marriage, being next in ment. The Lady from the Sca (1888) is an elegant The Lady from the Sca (1888) is an elegant poetle conception, essentially the same in idea as the Ibal's House. In thoose (1881) I, exploits to the fullest the possibilities of hereditary disease as a dramatic motif. The Wild Duck (1884), an unsatisfactory piece of symbolism. 18, like Brand, an attack on unpractical idealism. His late works are: Hedda Gabler (1890), The Master Builder (1892), representing the zenith of his powers, Lattle Eyoly (1894), John Gabriel Borkman (1896), and When We Dead Awaken (1990), all of which are whichy developed from the ideas contained chiefly developed from the ideas contained in his earlier works. All his writing is preeminently suited for the stage, and consummately skilful in technique. See G. B. Summerer sandinace another. See (c. B. shaw, The Quindessence of Ibenium, 1891; Sundede l'aerken (collected works), 1898; G. Brundes, Ibsen and Bjornson, 1899; W. Morison, (trans.) Correspondence, 1905; W. Archer and others (ed.) Ibycus, Gk. lyric poet of about 540 B.C. b. at Rhegium, Italy, and spent most of his life at the court of Polycrates of Samo. his life at the court of Poly crates of Samos, According to tradition he was murdered at sea near Corinth. The crime was traced by means of cranes which had followed the ship, and 'the cranes of lbycus' became a proverbial expression for divme revelation of crime. The story is the subject of Schiller's poem Die Kraniche des Ibycus (1798); for fragments of his verse, see Diehl, Anthologica lyrica Graca, ii. (2nd ed.) 1912.

Lea, dept. of Pecu, bounded N. by Lima.

Ica, dept. of Peru, bounded N. by Lima, S. by Arequipa, E. by Avacucho, and W. by the Pacific; covers an area of 9798 sq. m. Much of the surface is sandy desert, but the valleys of the Chincha, Condor, and I are fertile, and yield fruits, cotton, and indigo. Wine and brandy are made from the fruit, and a considerable amount of copper is inmed. The chief in, is i. (San Geronimo de L) which was ruined by an earthquake in 1617. Pop. (dept.) 110,300; (tn.) 21,200.

Ioa, or Putumayo, 11v. in Ecuador, S.

America, rises in the Andes, flows S.E., and at São Antonio, in Brazil, joins the Amazon. It is navigable for small craft for 750 m.

Icarius (Gk. 18090), (1), or Icarus, in Gk. legend an Athenian, taught the cultivation of the vine by Dionysus in return for hospitably entertaining him. tributed his new gift freely, and the shep-herds of the neighbourhood becoming intoxicated, thought they had been porsoned by him and slow him, throwing his body into a well. Ergone, his daughter, hanged herself in despuir on learning the news of her tather's death. According to news of her tather's death. According to tradi-tion, Frigore is the Virgo in the zodine, fearus is Bootes, and Icarus's dog, Maira, is Procyon or Canis Minor. (2) Lace-demoman, was the father of Penelope, whom he tried to dissuade from accompanying her husband, Odysseus, to Sparta. She insisted on carrying out her intention with such modest tirinness that her father erested a statue of modesty in her honour. Icarus, see D.EDALES.

ice to word common to the 'Feutonic languages), name given to the substance into which water changes when subjected to a sufficiently low temp. It is a colourless erv-talling solid, generally assuming forms belonging to the hexagonal system; its habit of twining is the origin of the 'ice-flowers' and designs assumed by hoar-frost. In the form of hoar-frost, snow, and half, is often precipitated. The temp, at which water freezes into I. is very easily determined, and for this reason is employed as one of the standard temps. In the measurement of the scales of a thermometer. In the Centigrade system this temp, is zord, as in the Reaumur, whilst in the Fahrenheit system it is 32°. In the act of freezing, I. undergoes a notoworthy expansion, so that I. at 0°C. is not so dense as water, as is proved by the fact that it floats thereon. In the

and the water formed contracts under beat t till the point of maximum density, about 4° (' i to ched Above this temp the 4°C I LOURCE VIOVE this temp the expansion of water is continual, and at no temp as water less dense than 1. The density of I at 0°C is 917), of water at 0°C, 99985, at 40. C. at 10°C, 99976, and at 100 C, 95866. The coefficient of cubical dilaton of I at moderately low temps has been calculated as 100013. hadded as 10001.5 and its specific heat is 500, or about half that of vater When I as meld although no recoft temp tales place is defined quantity of heat is all midd namely 50 calones per materials. gram, and the same arount of heat 1 to a stribe the slow influx of heat given out when water tecomes I. freezing point must be lowered by in macromines is grewing. It is also largely crease of pressure and it has been a continue as a utilized means. For details as crease of pressure and it his been a cet that for every additional atmosphere of pressure, the freezing point of water is lowered 0.0070 degrees. This discovery was theoretically worked out by Jan e. Thomson in 1831, and verified experimentally by his brother Win thomson (Lord Kelvin) in the following year. Many of the properties of 1 are explained by this uniong others that of experimentally by which two blocks of 1 and regulation, by which two blocks of 1 and regulation, by which two blocks of 1 and on a typical way from its precent by near the properties of the regulation, by which two blocks of 1 and on a typical way from its precent by near the point of contact 1 and one within view of whalers. The pressure if the point of contact melts the 1, but this relieves the pressure and the water at once freezes again, until in time the two surfaces coalesce. The motion of glaciers is also probably due to this process

I forms on fresh water if the temp of the air is below free jug point for sufficient time, but not until the whole mass of water is cooled down to the point of maximum density Sea water will not freeze, under the most favourable conditions until a temp of -2° (19 reached, in the I formed four fifths of the salt until a temp of -2° (14 reached), in the fem point of the fit was collision originally present is rejected, so that water melted from see ice has less salinity than I which can ed the wreck of the minimum sea. I. exists on a grantic scale in the glaciers and snows of mountainous regions, especially in the seas and lands of both Polar regions. From a guard Patrol for the location and destruphysiographical point of view, I. is an innortant agent in the denudation and months, the patrol annually plots the

movements of some thousands of icebergs, and radios their positions to ship-ping. Aircraft are used, too, in the search, and any ship sighting an I. must report the position. The destruction of the Is. cannot be hurried: explosives, gunfre, and even flame-throwers have been tried to hasten their end, but in vain.

Ice-breaker. Many of the harbours of N. Europe are frozen over for a great part, or the whole, of the winter, to a depth of sev. ft., so rendering navigation impossible. The only method of keeping a channel open is to prevent the ice from freezing too thickly, and this is done by reeding too thickly, and this is none by the continuous passage up and down of a specially-designed vessel. Such vessels are known as 1s., and naturally present some peculiarities in construction. They must be both weighty and powerful, of exceptional strength, and capable of travelling at sufficient speed to break the ice by their momentum. In addition to cracking the ice into pieces of some score tons, they are constructed to slide up on to the ice and break it down with their to the ice and break it down with their weight. The Ermah, built for the Russian Gov. by Sir Whi. Armstrong & Co., was the first important ship of this kind. She had a length of 320 ft., a breadth of 71 ft., her displacement was 8000 tons, and her engines, of 8000 LH.P., developed a speed of 15 kinds. The Ermak could break her way through 12 or 13 ft. with ease, and has rammed through 31 ft. Sho rescued on one occasion eight out of nine vessels which had been caught in the ice, the last one sank before the Ermak could reach her. In 1917 yet larger and stronger ships, the Sriotogor and the Linin, were built by Armstrongs for the Russian Gov. The Lenn could get under way in twe mins, after being trozen in all night. These is, are also passenger ships. A smaller I., built on the same lines, the Sampo, was built for the gov. of Finland. Many Canadian and Anot, ports are only kept open by the use of ice-breaking ferry steamers, such as the Scotia, built by Armstrong, Whitworth & Co. to carry railway trains across the Straits of Canso to and from Port Mulgrave, Nova Scotia. to and from Port Mulgrave, Nova Scotta. In 1966 the I. Lady Gray was built for the Canadian Gov. by Vickers, Maxim & Co., and in 1909 the Earl Grey, on the same, lines, but modified for extra speed, was built by the same firm. Since these versels were built many ships that use the Canadian ports and the St. Lawrence R. or built on the local way for the proportion. are built on the ice-breaking principle— that is, with a sharp ked that rises diagonally to the front of the ship, lifting it on to the lee by the sheer torce of the drive and cracking the ice by its weight. Is. are built on the watertight compartment principle, as there is always a climee of some part of the bottom or sides being pierced or crished. The hull of an 1, has pierced or crished. The num of an 1, has a very stout frame with the ribs spaced very close together, 12 ins. fore and aft and 10 ins. in the middle, while the plates are of unusual thickness. The outer skin is double right fore and aft along the water-line and to the bottom of the keel, very close together, 12 ins. fore and at and 10 ins. in the middle, while the plates are of unusual thickness. The outer skin is double right fore and at along the water-line and to the bottom of the keel, where the friction of the ice is apt to wear m., and glaciers exist in all the mts. away the material. Tanks are fitted in above 4000 ft. In sev. of the mts.

the fore part which can be filled at the rate of 250 tons an hour in order to give the required weight. The counter is the required weight. The counter is specially strengthened so that she can break ice when going astern, and the rud-der is built in the form of the ship to escape injury.

Ice-flowers, see FROST FIGURES

loe-flowers, see Frost Figures.

loe Hockoy, originated under the name of Bandy in the Fon country round the vil. of Farith over a hundred years ago. Since that time it has been played elsewhere in England, and has been introduced on the Continent, into America and into Com.do where it is the national game. For the game of Bandy' there were eleven players a side, the stick or bandy' was like a hockey stick, and the ball was a rubber lacrosse ball. But the came, developed in America and Camada. game, developed in America and Canada since 1867, is now played somowhat officently under the name of I. H. In I. H. there are say players a side, using a large broad-bladed type of hockey stick, but instead of a ball the game is played with a vulcanised rubber disk called a puck. Four reserves are allowed to each The arena is enclosed by wooden barriers about three ft. high, and this means that the puck does not go out of play frequently. The goals are each 4 ft. high by 6 ft. wide, and stand in goal areas 8 ft. by 5 ft. This fact, coupled with the shippers surface, makes the game exceedingly fast, and it is generally claimed to be the fastest game in the world.

Icel, we MIRSING.

Iceland, is, republic situated in the N. totand, is, tepublic situated in the N. Atlantic Ocean. It is 2.00 m, from the S.L. coast of Greenland and 600 m, W. of Norway. Its area is over 39,700 sq. m., length 295 m, and breadth 191 m. The total length of its coast-line is about 3730 m, about one-third of which belongs to the N.W. peninsula. In shape it is a rough oval, its marrowest point being at the S. The const-line presents a constat the S. The coast-line presents a conpenetrating far inland except for a considerable portion extending along the S.E., which is almost unbroken. It is an ico-covered plateau or tableland built up of volvame rocks and pierced on all sides by foods and valleys. The lowlands cover about one-fourteenth of the whole area, and are almost the only part of the is. and are almost the only part of the is, which is inhabited, the central tableland being absolutely uninhabitable on account of the rigon of the chunte. The habitable area of 1. is about one-fourth, glaciers, lava-streams, and elevated deserts making up the rest. The two bays, Hunalloi and Bredthiford, separate the N.W. peningula from the main mass of the is. thus forming two full-largeof the is., thus forming two tablelands—a large and a small. The isthmus cona large and a small. neeting the two is scarcely 5 in. wide, but has an altitude of 748 ft. The N.W. peninsula has an elevation of 2000 ft. The int rior of the is, has a wild and desolate the volcanic agency is still active, and the S. coast, and was estab, permanently terrible eruptions have repeatedly oclour years later at what is now Reykjavik. curred within the last four centuries. The 10 ther settlers soon followed, and in the curred within the last four centuries. best known volcanoes aro Hekla, Katla, and Askia. A large portion of L is covered with lave, and the hot springs or geysers scattered throngnout the is. are other specimens of volcanic agency. These are specially found in the S.W., where one of the main goysers throws up at intervals jots of water, stones, and mud to a height varying from 100 to 200 ft. In Mt. Hecla (5095 ft, high), which last crup-ted in March 1917, are best exhibited the general effects of volcame agency.

The scenery of the is, is of great natural beauty, the climate is mild for the lat., and the weather is extremely variable, storms and hurricanes often occurring The vegetation is tolerably uniform throughout the is., presenting the characteristics of an Arctic-European type Heath and bilberry cover large stretches of the surface, and grasses are of great importance to the inhabs., who are dependent on them for supplying them live-stock. The development of forest-trees is insignificant, the birch being almost the only tree found, and this in a very stunted fine. It to 10 ft. in height. The wild flora of L is small and delicate, with bright bloom, savurages, sedums, and heaths being especially admired. As regards the fauna, species are few. The polar-hear is an occasional visi tant, and reindeer were introduced in 1770. The seas abound in seals and whales. Over half of the species of birds are water fowl, of which the most important is the eider-duck on account of its down. The birds of prey are the Icolandic falcon and the cagle. The ptaringan is the only game bird. Great numbers of sea-guils, guillemots and puftins are seen near their breeding places on the cliffs and islets round the coast. Tho hooper or whistling swan is also found in considerable numbers in I. The codfisheries are valuable, trout are production the lakes and streams, and salmon in the lakes and streams. The sea abound in many of the rives. The searound the coast teams with haddock, halibut and basking shark. There are no railways in 1.; but in 1910 there were some 2800 m. of completed roads. The national Church and the only one endowed by the State, is Evangelical Lutheran. There is a univ. in Revkjavik. The chief products of L are fish, itsh oils, wool, mutton, and ponies. The chief exports are salted fish, meat, fish oil, and timber, and much of them go to the United Kingdom. much of them go to the Chited Kingdon. Reyklavik has a pop. of 18,900. Other ths, are Akureyri (6100), Hafnarfjordur (4100), Vestmannacyjar (3100), Siglutjordur (2900), Isatjordur (2900), Alcranes (2300), Nos (1200), Olaf-fjordur (915) and Scydis-

fjordur (\$11).

History.—1. received the greatest portion of its pop. from Norway between \$60 and \$70, when it was colonised by Scandinavian Vikings, Viking, though some settlements of Irish monks had been made about the end of the eighth contury. The first Norwegian bad been made about the end of the divided into two periods, the anet., exemple contury. The first Norwegian tending to the fall of the republic, and the settlement was made in 870 by Ingolf on modern, from that date to the present

Other settlers soon followed, and in the course of sixty years all the habitable parts of the coast were settled. The gov. was at first in the hands of the overseer of the temple in each settlement, but lutterly, when the separate jurisdictions were joined together, a kind of aristo-cratic republic was formed. Christianity was introduced in 981, and adopted by law in 1000, and schools and bishoprics were c tab. I. was a dependency of the han Crown from 1380. In 1918 I. again town from 1860. In 1911, again became a sovereign state, but united as a constitutional monarchy to Denmark with one king. Following the aunexation of Denmark by the Gers. (April, 1940) the icelandic ministry assumed control of do own foreign relations. Soon afterwards the is, was occupied by Brit. naval and multary forces with the object of protecting But, maritime interests, because the is was of great strategic importance in relation to U-boat warfare and as a potential lase for the invasion of the Brit. Isles. in 1911, the Althing decided to estab. a republe; but pending the formal abrogation of the union with Denmark a regent was appointed from year to year. In July 1911. President Roosevelt announced that Amer. forces had occupied I. These forces were not intended to replace the But, forces, President Roosevelt, in a message to Congress, said that the U.S. could not permit occupation by Germany of strategic outposts in the Atlantic to be used as air or naval bases for an eventual attack against the W. hemsphere. The Brit, guarantee of the tuture of L's independence was repeated by Mr. Roosevelt, who said that the U.S. Gov. did not wish to see any change in the custing sovereignty of the country. By extending Amer. defences to I., a half-way house between Britain and America, Wr. Roosevelt had taken a step that was demorphise consequences. of cuormous consequences in safeguarding the line between the U.S. and Britain. by debiseite (May 23, 1941) Ce Act of Union of 1918 was repeated and a now constitution adopted providing for a re-publican form of gov. Executive power is in the hands of a ministry L. Reykjavik, responsible to the national legislative assembly or Althing (founded in 930 A.D.) of two houses. The membership of the Althog is maintained, under the new constitution, at 52, of whom 14 are elected to torm the Upper House,

I anguage.—The feelandic is the most northerly of all cultivated tongues. It is tice from gutturals and excess of hissing sounds, soft and sonorous to the ear, and nch in roots and grammatical forms. There are thirty-the clotters in the alphahet, all the Eng. except w, also c, (the terman a and o), b, and two characters for the Eng. th. The present-day language is almost precisely the same as that spoken and written at the date of I.'s colonisation in the math century.

Literature. -- Icclandic literature may be

The hterature of the anot. period | may be divided into three groups, viz the anct, mythical, and herote songs, the scaldle poetry, and the sugas. I, has always borne a high renown for song, al though it has never produced a poct of a high order Among the most important works in Icolandic liter iture is the coliceworks in columns ther tune is the conce-tion of anoth a then songs called the Lider or poets Edda, compiled soon after the introduction of this tanity songs of victory, elegies, and sparams also belong to the init period of the literature Among the mythical songs may be mentioned the Voluspa, Hamarsheimt, Hyms-kanda, et Of the writers of scaldic poems may be cited I all Skallagrimsson, who wrote a fine lament for his son Lyan i, Kormak etc. The crowning product of Icelandic genus however, is product of iteration remains another processor in this is in its purest form, the life of a hero composed in regular form and governed by fixed rules, and whended for oral recutation. The saga grow up in the quieter days that followed the change of faith (1000) when the dieds of the great fimility heroes were still chorished by their descendants and the explains if the great kings handed down At all 1 asts and gather ngs the telling of stories was an amortant feature and the regular form. The Irish in lucino did much to peract the form in fit 1 to the W sug is, consisting the fly of local and far it v hist, they also comprise a large number of hists and committe works amongst them the Coblins the Volume Series the Committee Comm being the Folsunga Siji the Gunn langs Saga the Saga fili if Kr a and his Companions Frill if Sagi etc. Of he larger and more important class of sagas retered to may on at in 1 the Islandingsool, the Instituted in a ount of the settlen n of the 1) the Islandingsool, the Institute 1 is a notation of the settlen n of the 1) the Islandings Sagas the Islanding Islandings Sagas the Islanding he larger and more unpertant class of ni Sair (m) Jonson 1 Pr mer of M en leclandie 1927 The Lecland Vear 1 / V Gul sons on 1 trans of M on Icelandic 1927 In Island Year I \ Cul mund on Island am Begin id \ X Inhr hundert, 1904 I Thoroda Island, 1906 I Brum, Inited for pan Island 1 21 D \ Lun den Island Reckett, Iceland I alure, 1901 I Indicate, Iceland I alure, 1901 II Indicate, A Inna of Contrasts (New York), 1937 S J Unwin Iceland and Inna of 1941, B, Thorday on, Iceland Instand Present, 1941 1911

Idalium (Gk. Idahov), anct. tn. of

Cyprus, was situated almost in the centre of the is., on the site new occupied by the vil Dalin or Idalion. It was sacred to the worship of Aphrodite, who was hence named Idalia. The tu, was destroyed by earthquake before the time of Pliny.

sought her favour. They fied in a winged chariot given by Posoidon, but were overtaken by Apollo at Messenia, where god and mortal fought for the nymph. Zeus, interposing, told her to choose between her suitors and she chose I. She became the mother of Cleopatra and Aleyoné, and having meurred the wrath of Apollo, they d. young. I, and his brother both took part in the Argonautic expedition; they were killed whilst engaged in a raid into Arcadia with their cousing Castor and Pollux. Zeus came upon them as they were quarrelling about the plunder and slew I. by lightning.

Iddesleigh, Sir Stafford Henry Northcote, first Earl of (1815-87), Eng., statesman, began his political life in 1812, when he became private secretary to Gladstone. He succeeded as eighth baronet in 1851, and succeeded as eight to baronet in 1851, and four years later entered Parliament in the Conservative interest. Distacli appointed him president of the Board of Trade in 1866, and in the following year promoted him to the India Office. In 1874 he became Chancellor of the Exchequer, and

oreame Chancellor of the Exchaquer, and 1376, when Disracli went to the House of Lords, he became leader of the House of Commons. Created carl of Iddesleigh in 1884, he went to the Foreign Office in 1886. An unselfish man always putting party before himself, he was an admirable and much-loved statesman, though scarcely of the first rank, being lacking in lititative. LANGUAGES.

Idea (GL. ióta, from ióta, to see; Lat. species), term widely used both in philosophy and in common parlance for a mental image of any external object or for the abstract conception of a class of objects. It is also used in a wider sense for any product of intellectual action. Plato made use of the term in metaphysics to define the absolute realities eternally existing in the mind of God, or the model of which all the objects which can be per-ceived are made. These vary in detail, but the one archetype or 'ldea remains constant, and can be apprehended only by the action of the intellect. Empirical thinkers, who insist on the ceality of ex-ternal objects, have never accepted this users. Locke, at the beginning of his Losey on the Human Understanding, de-tines the term 'idea' as 'whatsoever is the object of the understanding when a man thinks, including, that is to say, all objects thinks, inclinding that is to say, all objects of consciousness—precepts, images, and concepts. Hume limited the term to the mentally reconstructed images of perceptions, while he introduced the term impression? for the direct perception. This use of the term is still common in popular language. Kant defined is, called by him Transcendental is, as the product of the Resson (Vernice) of product of the Reason (Vernunff), of which they are the highest concepts, transcending the understanding, and therefore incapable of verification by experience. In the language of Hegel and the Idealists, the term almost returned to the Platonic algorithms as the platonic desiries near the state way. range before the time of Phry.

its Platonic significance, being used for
curried her off from Apollo, who also end of all things. See A. Schopenhauer, The World as Will and Idea, trans. 1883–1886; A. N. Whitchead, Adventures of Ideas, 1933; H. Heyse, Idee und Existenz, 1935; N. Hartmann, Zur Lehre vom Eidos bei Platon und Aristoteles, 1911.

Idealism, conception in philosophy which holds that ideas are the only things known. The conception is developed along different lines by various philoso-phers, among them being Plato, while later pners, among them being Patto, while later systems were evolved by Locke, Descartes, and Spinoza up to Berkeley, but perhaps the most widely known are those of Leibnitz, Hegel, and Kant. Broadly speaking, I. may be discussed under the two main systems of subjective I. (or, as it is sometimes termed. Spiritual Mona-dism or Pluralism) and Spiritual Monism.

Subjective I. was expounded by Leibnitz as a bolief that each individual mind exists apart from every other mind as a distinct unit living as it were in a universe of its own, so that nothing happening in another mind's universe is the same as that which happens in its own. We are aware, not of objects themselves, but merely of sensations produced by the objects which bring consciousness of them from our sensory disturbances. become aware of the sensation rather than the object. Thus we experience not things of the world, but our own feelings, which give us images and representations of the world of objects. This position is known as Representationalism. Berkelev and Hume and perhaps the Its. Croce and Gentile belong to this school. Berkeley shows that there is, at least to us, no ex-ternal world, since all we know is our impressions of matter. He says in effect its existence consists in its being per-ocived. This conclusion is strenuously criticised by Realists (see Realistal). Spiritual Monism differs from this theory, particularly regarding its sense of isolation of the mind. Hegel, with whom may be associated Schopenhauer and Bergson, though each has points of variance, shows that each individual mind is a part of a universal force, fused into the universal embrace of the spiritual force of which it is only temporarily individual, that its very existence depends upon its being part of a greater force, that no object can be said to exist without its having a relationship to other objects. It is a part of another whole, which in turn is a localised part of yet another whole, until, finally, the universal whole is comprehended. This is called by Hegol the Absolute, and is certainly a more congenial conception than the intellectual loneliness of the mind according to the Pluralists. This idea of the Oueness of the Universe is the chief inspiration of the Universe is the chief inspiration of theologians who call God what for Hegelis the Absolute, and what Schopenhauer terms the Will. But whereas Hegel's idea of the Universal Whole is purely intellectual. Schopenhauer's Will is of the instincts and is coaselessly and spiritually striving. Hergson, however, sees in his unity of all things unhowever, sees in his unity of all things undefference is an important one. Many ending change as its mainspring, and have held that, so far from excluding that there is nothing but change. claims that there is nothing but change,

and, therefore, matter always in process of change has not existence at any given time.

Kant's idealism challenges Leibnitz's and Berkeley's in that there is no evidence that we know our mind any more intimately than we know objects. We are conscious of ourselves only in knowing something not ourselves. He agrees that all knowledge depends upon perception, but insists further that this knowledge is always limited by the fact that we are that ominds controlled by a particular place and time. Thought can extend the range of perception which reveals an object as a part of a whole which stretches indefinitely beyond in space and time. For further detail of Kant's standpoint the render is referred to his Critique of Reason. Scholastic philosophy groups together all these systems under the term transcendental ilealism, to which transcendental ilealism, to which immanent idealism is opposed by the neo-scholustics. Their position is that the intelligibility of things is immanent in them, and through that intelligibility the mind comes into direct contact with the thing.

The word I, has also taken another meaning, of a purely literary nature-the expression of beautiful or optimistic temperament; in its results, it is unalogous to the more general asthetic idealogy of Cousin and Lessing. In this sense, such writers as Fogo zzaro, Maeterlinck, Shelley, etc., are idealists, apart from any consideration of their purely philosophical sympathies. See FIGHTE, JOHANNES;

synnathies. See Fight, Johannes; Hegel, Georg Willielm; Spinoza, Baru H; etc.

See E. Caird, Hegel, 1903; H. Bergson, Philosophy of Change, 1911; C. E. M. Joad, Mind and Matter, 1922; W. R. Inge, Personal Idealism and Musticism, 1924; E. G. Braham, Ourselves and Reality Personality in British and American Idealism from the time of T. H. Green, 1930. J. H. Mulrhead, The Platonic Tradition in Anglo-Saxon Philosophy; Studies in the History of Idealism in England and America, 1931; G. W. Cunninglam, Idealistic Argument in Recent ham, Idealistic Argument in Recent Philosophy, 1933; A. Liebert, Die Krise des Idealismus, 1936; R. N. Cross, Idealism and Rectism, 1945.

Identity, term with various connotations according as it relates to questions of logic or of metaphysics. The logical law of L is usually expressed by the formula A - A, or A is A. It is a necessary law of self-conscious thought, being, in fact, merely the positive expression of the law of contradiction, which states that a judgment cannot be true and untrue at various times, and that the same attribute cannot at the same time be affirmed and denied of the same subject. Without such a law no thinking would be possible. The philosophical question of I. is concerned largely with the various ways in which I. can be predicated, and to the exact connotation of the term. The question as to whether or not I. excludes difference, it actually implies it; in other

words, that I is not undifferentiated, but jout the will of the members of a society. differentiated, likeness the question, however, is one of the conceptions of philosophical atomism (See W. James, Principles of Psychology, 1890, and B. Bosanquet, Issays and Iddresses, 1889) The question of personal I that is to say, of 'the continuity of personal experience in the exercise of intelligent causal energy, the results being associated in memory, wis first brought into promisence by Locke (Fesan, bk. il., ch. xxvi), and soon occupied the attention of Hume and Butler. The first is that which distinguishes each person from other thinking beings, and with which the preservation of sunty is closely bound up Sec 1 Meyerson, Identity and Reality 150

Ideograph, sign or symbol representing an ide i Ideography may be considered as the second stage of the writing (see Writing) In ideography, the use of signs depicting concrete, a third objects (see Pictouniyii) is extended to express similar concrete concepts and analogous abstrict conceptions. In other words, the ideograph represents not so much the thing it shows as the underlying idea thing it shows as the underlying idea associated with this thing thus for instance, in eight in thing (q), the symbol depicting the star eine to represent also 'sky heiven,' god,' the idge five 'high and so torth and the ji to griph leg we il o the idea znaph for to 'to stand,' to bring the name of the object or its action is, however, the highest days the metric days the metric of the object of its action is, however. riting (q 1), the clos ly identified with the picture An a system of writing, ideography consists or definite pictures conventional and simplified, selected by agreement or custom from the many expects ental pictures

aborgines. An inercoed awareness of Mort soni (q.) first orned fine for her the importance of the individual began system by its astonishing success among with the (iks) and freeyample Aristotics seed children. Thos who begined the political philosophy depended upon 11s or of educating and treiting fots and belief that 'na ural mark was man in it in eq. Read, Howe and Seguin, society could be it indidinent men, it therefore 'is a joint all animal.' It is it can the value of 'it work and therefore 'is a joint all animal.' It is it to settlift nagged upon it is inestim-however noteworthy that Aristotle had all the been classified into ten dive, to admit of a class of slaves in order to allow etilization that it is to lead 'the good second to have much to do with the state, life'. The spired of Christianty come in the general cause his vert to be displayed the much upon the cost the intervaluable. physical the importance of the individual and at the sinct necrolyed the old I aw of Nature into the I swof Cod is the final standard by which the acts of temporal rulers should be judged. The danger of anarchy on the one hand et of ecclos domination on the other, was met in practice by the emphisis laid upon the absolute power of the tuler. This in its turn, was countered by the theory of the Social was countered by the theory of the social Contract as the basis of security, which, however unhistorical, became a powerful weapon against authoritarian rule in the hands of John Locke and others. The conduct of modern times has been, basically, between these who conceive of the State merely as a machine for carrying-

and these who, deriving from Hegel, con ceive of the State as an organism greater than the mere sum of its members and possessing a personality, the individual inde full satisfaction in sinking his will into that of the State. To the latter into that of the State 10 the latter group belong totalitarian systems to the former, democracies The Communist position is somewhat anomalous, the idea that the State should ultimately wither away would seem to be a denial of Hegeliunsm, whereas in practice, an authentian in system would seem to result from the identification of the will of the pecile with one political party

England, situated near the Aire, 9 m. from Leeds. It manufs. woollen goods. Pop. 7873.

Ido, or Revised Esperanto, is, as its name implies, the offspring of Esperanto (q.r.), the international auxiliary language. origin of I. is, according to its partisans, to be found in the Delegation for the Adoption of an Auxiliary International Lan-guage, founded in 1901. I., does not claim to supersede Esperanto as that tongue superseded Volapuk, but merely to sim-plify, regularise, and improve it. The two chief alterations effected are the doing away with all accented letters and the suppression of a few grammatical rules (e.g. accusative case, agreement of the adjective) which the partisans of I. con-

sider unnecessary.

Idoorase or Vesuvian, mineral consisting essentially of silica (37 to 39 per cent), alumina (13 to 61 per cent), and lime (33 to 37 per cent), together with a small percentage of oxide of iron, magnesia, and water. It occurs in the form of short tetragonal crystals, which show a large number of faces (sp. gr. 3·1, h. 6·5). The mineral has a vitreous lustre and varies in colour from brown to green. It was first found in dolomitic blocks ejected from Vesuvius, but occurs also in granular limestone, serpentine, gueiss, and other metamorphic rocks. The finest specimens come from Siberia, Piedmont, and Norway, and are cut, polished, and sold as chrysolite or jacinth.

Idolatry (Gk. ετωλου and λατρεια, idol-worship), worship paid to images or other objects supposed to be the abode of a superhuman personality. The term is sometimes used generically to denote all forms of worship of visible and concrete, as opposed to unseen, existences, thus including litholatry, pyrolatry, zoolatry, and the like. St. Paul uses to express worship of false gods, and the whole heathon cultus (see Gal. v. 20: 1 Cor. z. 14: 1 Pet. iv. 3). Regarded by the early obvious as a desergence for from a higher church as a degeneration from a higher primeval faith, it has since been shown rather to mark a stage of upward movement and progress in religious growth. While and progress in religious growth. While absent among Hottentots, Fuegians, Veddahs, Bushmen, and others, I. was extensively practised among the great civilisations of old, by Egyptians, Chaldeans, Indians, Gks., Roms., Mexicans, and Peruvians. Relics of this worship remain in the 'nirgalli' (Images of monsters), common outside Chaldean palaces. Into these it was believed that maignant stricts with as those of disease would spirits, such as those of disease, would enter. Statues and idols connected with the worship of the dead were common among many peoples. The Maori 'atua,' or ancestral deity, was supposed to enter his carved wooden image on the incantations of a priest, and to deliver oracles. The earliest stages of I. are Naturiam and Animism. Fetichism, a degraded form of the latter, is often the direct antecedent Private and personal idols or

Idiosynerasy, converse of antipathy fetiches, like the Heb. teraphim (see (q.v.), being a strong disposition towards Gen. xxxi. 19, 31; 1 Sam. xix. 13), are certain things
Idio, tn. of the W. Riding of Yorkshire, antional idols are a late development. The human figure came to be the predominant model. Images were probably intro-duced among Christians in the second century, and are often found in Christian tombs in the Rom, catacombs. In the sixth and seventh centuries abuses crept A reaction arose against I. in the E., m. culminating in iconoclasm (c. 726). A characteristic of I. is its tendency to revive even after the introduction of purer spiritual ideas. Thus the Israelites were apirtual ideas. Thus the Israelites were often in danger of relapsing from monotheism (see Exod. xxxii.; 1 Kings xi. 5; xu. 23; xiv. 15, 23; xvi. 32). The Rom. Catholic and Uk. Churches still revero images of the Virgin and saints, though of course this subject should hardly be dealt with under I. The Reformers and Calvinists repudiated this practice, but Inthe alloyed images as possibly heloful. Luther allowed images as possibly helpful to devotion. See also IMAGE-WOISHIP; RELIGION. See the works of J. Voss, A. van Dale, H. Spencer, Sir E. Tylor, T. Waltz, V. Schultze, A. Réville. See also K. Kraus, Roma Sotteranea, 1879; G. D. Alviella, 'Los Origines de l'Idolatrie' in Recue de l'histoire des Religions, XII, 1845; J. Lippert, Culturgeschichte, 1886; A. B. Lubbock, Origin of Civilisation, 1902; J. Idomeneus, son of Deucalion, king of Crete, and grandson of Minos. As king Luther allowed images as possibly helpful

Crete, and grandson of Minos. As king of Crete, he led eighty ships to Troy and played a leading part in the battle, being described in Homer's Iliui as one of the mightiest of the heroes. In later writers he is represented as vowing in a storm. provided he arrived safe home, to sacrifice to Poseldon whatever he first met on landing. The victim was his son, whom he accordingly sacrificed, and his subjects, in consequence, drove him forth. He wandered in Calabria and Italy, where he estab a shrine of Apollo near Colophon

when he died and was buried.

Idria, or Idrija, tn. and com. of Istria, Yugoslavia, 26 in. N.N.W. of Trieste. There are quicksilver mines in the vicinity which have been worked since the sixteenth century and lace manuf. 10,500.

Idris, mythical figure in Welsh tradition who had his rock-hown chair on the summit of Cader Idris. He was supposed to have the power of conferring poetic inspiration, and of inducing madness or death.

Idris, see ENOCIL.

Idrisi, Abu Abdallah Mohammed El-, sce EDRISI.

Idumæa, see EDOM.
Idun, or Iduna, name of a goddess in
Norse mythology. She was the daughter Norse mythology. She was the daughter of the dwarf Svald, and became the wife of Bragi. She personified the reviving year, being imprisoned in the nether world by Thiassi (winter), from whom she escaped, and appeared again in the shape of a bird in the springtime.

Idyll (Lat. idyllrum, a little image), word

used to describe a species of poem repre-

senting simple scenes of a pastoral life, not, however, exclusively used for poems of a pastoral character. Tennyson, for example, in his Idylls of the King, presents an epic style and treatment, the incidents portrayed being of a romantic and tragic nature. Theoretus, too, in his Eidyllia (thirty in number), wrote less than half in the pastoral form. leper, see YPRES.

lerne, see HIBERNIA.

Ierugena, Johannes Scotus, sce Ent-

lesi, or Jesi, tn. of Italy in the prov. of Ancona, situated on the l. b. of the Esho, 17 m. S.W. of Ancona. It is noted as the bp. of the Emperor Frederick II., and possesses a fine cathedral. Pop. about

16,000.

If, islet of Bouches-du-Rhône dept.. off the S. coast of France, opposite Marseilles in the gulf of Lyons. It was one covered with yews ('15'). Its fortress. Château d'1f, built by Francis I. (1629), is famous. It was used as a state prison later, Mira-beau and Philippe Egalité being im-prisoned there. In Dumas's Count of

prisoned there. In Junior Many Cresto the bero is confined there. Iffland, Augus' William (1759–1814), Ger. actor and cramerist, b. at Hanover, and educated for the ministry. In 1796 he became director of the Berlin National Theatre, and subsequently superintendent Theatre, and subsequently superintendent of all the royal theatres, the Berlin stage reaching its highest point under his management. Among the best of L's plays are (titles trans.). The Backelors (1799), The Foresters (1799), The Lawyers (1799), The Nepheus (1800), Crime from Ambiton (1800), and Conscience. His dramatic criticism is to be found in his Almanach fur Theater und Theaterfreunde (1815), and his Thorre der Schausmellung (1815), and his Theorie der Schauspielkunst (1815). See his collected dramatic works, 1844; Duncker (ed.) Iffland in seinen Schriften, 1859, and Iffland's Berliner Thealerleitung, 1896, and monograph by E. Kliewer, 1937.

Ifni, scaport tn. and dist. of W. Morocco. Africa, 35 m. from Aguilon, opposite the Canary Is., ceded to Spain by Morocco in 1860. By the Franco-Sp. agreement of 1912 it extends along the W. coast of the N, of Wadi Dran and a distance of 15 m. inland from the coast. Pop. chiefly en-gaged in fishing and cultivating garden produce. Area 965 sq. m : pop 20 000 produce

Hrit, Hreet, Afrit, or Afreet, in Arabie folklore, ogre of an evil disposition.

Igel, vil. of Rhineland, Germany, 3 m.

S.W. of Trier. It contains the celebrated I. obelisk, or Heidenthurm, a sandstone monument 75 ft. high, one of the most remarkable Rom. relics N. of the Alps. This was a funeral monument of the

Secundin family. Pop. 700.

Iggdrssil, see YGGDRASIL.

Iglau (Jihlawa), tn. on the Bohemian
frontier of Moravia, Czechoslovakia, 123 m. N.N.W. of Vienna, on the Iglawa. Manufs. include tobacco, plush, woollens, cloth, glass, and nottery. It was a mining centre in the Middle Ages, silver being worked from the eighth century. A treaty onding the struggle between Sigismund and the Hussites was signed here (1436). More reliance is to be placed on the earlier

In 1805 the Austrians defeated the Bavarians here. Pop. 23,400.

Bavarians here. Pop. 23,400.
Iglesias, tn. and episcopal sec of Cagliari prov., W. Sardinia, Italy, 32 m. from Cagliari. The chief mining centre of Sardinia, it has zinc and leaf mines. There is a cathedral (1285), an old castle, and a bishop's palace. The tn. is partly surrounded by walls, and its citadel dates from 1325. Malaria is prevalent. Pop. 21, 800 21,800

Iglesias de la Casa, José (1748-91), Sp. poet, a native of Salamanca. He first wrote satiric ballads, epigranis, and 'letrillas' directed against contemporary society and morals. He entered the church church (1783), becoming priest of Larodrigo, and then of Carbaiosa de la Sagrada. His later works contained much theological discussion. I. is often ranked with Quevedo (1580-1615). His Collected Poems first appeared in 1798. In 1802 Grows first appeared in 1798. In 1802 some of them were put on the Index. See G. Ticknor, History of Spanish Literature, 1819; H. W. Longfellow, Poets and Poctry of Europe, 1819; C. Real de la Riva, Iglesias in Salumanca, 1931.

Iglo, tn. of Hungary, in the co. of Zips, situated on the Hernad. It has iron and copper smelting works, a linen and flax. Pop. 9000. and a trade in

Igloo, F-kimo hut. Built for temporary habitation during the winter season, the buts are frequently constructed merely of blocks of ice piled high in a dome.
Igloolik, small is, of N. Canada, situated

in the Arctic Ocean, in Fury and Hocla strait, in lat. 69° 21' N., and long. 81° 53'

Ignatiev, Nikolai Pavlovitch (1832-1906) Russian general and diplomatist, b. in St. Peter-burg, and the son of Gen. Paul I., a favourite officer of Alexander II. He was educated in the corps or pages and exchanged from the military to the diploexchanged from the mintary to the diplomate service in 1856, having served in the Cruncan War and been made a colonel and mator-general. In 1853 he was made diplomatic attaché to Gen. Muravieff, rovernor of E. Siberia, and negotiated the treaty of Aigun with China, by which the region of the Amur came into the posses-sion of Russia. Two years later, he was sent as plenipotentiary to Peking. In 1863 he was placed at the head of the Asiatic dept. of the ministry of foreign attairs, and made adjutant general of the Czar. He was an active agent at the out-break of the Russo Turkish War in 1877, and the treaty of Stelano was largely his At the close of the war he fell into work. disfavour and retired from office. On the accession of Alexander III., however, he was made minister of the interior, but was discussed in 1882 for permitting the persecution of the Jews.

ignatius, bishop of Antioch, one of the apostolic Fathers, perhaps the most remarkable of all the figures of the century immediately following the Apostles. Very little, however, is known about his life, and about his birth and parentage nothing is known. A late tradition says that he was the little child whom Our Lord placed. as a pattern in the midst of the disciples.

tradition which speaks of him as the disciple of St. John the Apostle. Euseblus also tells us that he was the second successor of St. Peter in the see of Antioch. Later traditions are so untrustworthy that we are forced to rely entirely on the internal evidence of the letters which I. wrote. These were sent from various cities at which the saint stopped as he was being hurried to Rome for martyrdom (A.D. 115-117) during a persecution which arose at Antioch in the reign of Trajan. The letters themselves present a most difficult critical problem, which now, however, after the labours of Zahn, Lightfoot, Harnack, and others, seems to have reached a satisfactory solution. The difficulty is brought about by the fact difficulty is brought about by the fact that three widely-different recensions of the letters exist. The short or Vossian reconsion consists of seven letters, the number which Eusehus ascribes to 1. They are written to the Ephesiaus, Magnesiaus, Tralliaus, Rouss, Philadelphiaus, Surarneus and to Polycum is recentification. nessas, trainans, from the control of the control o and sev. others in addition, six in the Gk. form, and ten in the Lat. Finally there is the Syriac or Curetonian recension, containing only three epistles, viz. those to the Roms, the Ephesians, and Polycarp, all in a shortened form. Much controversy has taken place as to which of these recensions was to be regarded as the genuine work of I. The arguments genuine against the long recension are conclusive and scholars are now generally united in upholding the claims of the Vossian recen-The Syriae recension is to be regarded as an abbreviated ed. of the seven epistles, and not as the original and un-expanded form. The letters are directed against Gnostic and Docetic here sy, laying great stress on the duty of adherence to episcopal authority, and the escential episcopal authority, and the essential nature of the episcopal office. See works by T. Zahn, J. Lightfoot, F. Funk, A. Harnack; M. de Wulf, History of Medie-ral Philosophy (trans. by E. C. Mossenger). 1926; H. W. Bartsch, Gnostickes Gut und Gemeindetradition bei Ignatius ron Antioch, 1940.

Ignatius, Father (1837-1908), name, as a religious, of Joseph Leyer-ter Lyne, as Englishman who devoted his life to an attempt to revive the Benedictine life in the Church of England. In 1870 he founded a community of Lianthony Abbey, near Abergavenny, but his attempt having been made without any reference to eccles, authority, it came to an end after his death, the property passing to the Benedictine community of Caldey, of which the greater number second in 1913 to the Church of Rome. F. I. was a great preacher, and his mission sermons in London attracted large numbers.

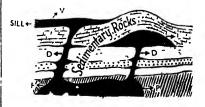

Ignatius, Saint (c. 800-878), Patriarch of Constantinople, was the son of Michael I., emperor of the E. He was compelled to enter a monastery, whence he rose to the patriarchate through the favour of the

Empress Theodora.
of the iconoclasts. The influence of his
brother Bardas, whom he had excommunicated, led to his being forced to abdicate
in 466, but he was restored in the following
year.

Ignatius de Loyola, see LOYOLA, IGNATIUS

DE, and JESUITS.

Igneous Rocks include all those which at some time in their hist, have been in a molten condition. Their differing physieal characters, which are largely dependent on their rate of cooling, suzgest one form of classification into: (a) Volcame, in which the rate of cooling has been comparatively rapid, so that the crystallisa-tion is by no means perfect, hence this kind contains large quantities of glassy material; (b) plutonic, in which the cooling has been extremely slow, so that the crystallisation is almost perfect, hence there is little, if any, glassy material present. Between these two in nature there is seldom any strongly marked line of separation, for they mergo into one another, and the dyke rocks may be defined as of the intermediate type. In the diagram, P represents the deep-scated

plutome rocks. D the intrusive dyke rocks, later in age than the rocks they penetrate, and forming dome-shaped ha colitis. L in certain areas. V indicates the volcanical layer, effusive or cruptive rocks. Thereform sills which are contemporaneous with the sedimentary rocks they overlie. Examples of such sills occur in the N.W. ters. of N. America, in Iceland, the Faroe Is., the Decean, Abyssinia, and fragments in Ireland and Scotland. Large shapeless masses (bosses) of plutonic rocks become exposed through the denidation of overlying rocks. These outstanding masses may be seft by the weathering removal of surrounding material from the solidified layer in the nock of a volcano. Many such necks or coros remain, e.g. in Scotland, as rolles of past volcanic activity. I. R. are chiefly composed of oxides, as silica, alumina, iron coxide, ime. magnesia, etc.; in consequence a frequent classification of such rocks depends on their chemical composition and more particularly on the percentage of silica prosent, A brief summary of such a grouping follows:

1. Acid igneous rocks, containing from 66 to 80 per cent. of silica. The plutonic example is granite, a holocrystalline rock containing the essential minerals, quartz, felspar, and mica (generally muscovite). The glassy, rapidly-cooled, volcanic representative is obsidian, which resembles bottle glass in appearance. The hemicrystalline variety is called rhyolite. The two latter have roughly the same chemi-

cal composition as that of granite.

2. Sub-acid intermediate rocks, containing from 60 to 66 per cent of silica. The essential constituents of these are ortho-clase and hornblende, the latter of which may be replaced partly by augite or maca. Representatives in the same order as those of the first group are syenite, trachytic pumice, or trachyte glass, and trachyte. The trachytes bear much the same relation to the syenites that the rhyolites do to the granites.

3. Sub-basic intermediate rocks, containing from 55 to 60 per cent. of silica. The essential mineral constituents are placiochatic felspar (usually oligoclase or labradorite) and hornblende, which may be replaced by augite or mica as in the case of the syemtes. Representatives in order are diorite, andesite glass, and andesites. The andesites occur in enormous masses in the Andes Mts., and are perhaps the most of meantly found of all

the I. R.

1. Basic rocks, containing from 15 to 55 per cent of -ilica, i.e. the acid-forming oxide is less in amount than the basic oxides. In this case the essential min-oral constituents are plagiculastic felspar (usually labradorate or anothite), augite, and olivine. Magnetite is always present as an accessory. Gabbro is the holo-crystalline plutonic representative. The glassy example is tachylite or basalt glass, while the hemicry stalline rock is basalt. In this group rocks called dolerites are intermediate in position between the

gabbros and basalts.

5. Ultra-basic rocks, containing only 35 to 15 per cent of silica, are very rich in olivine, which readily decomposes and causes the rocks to change quickly into some variety of the scrpentines. Members of this class of ultra-basic rocks are also called Peridotites, e.g. Picrites, Cherzolite, and Dunite. Chemical analysis is, of course, impossible in the field, so that if it be necessary to classify the rock on the spot, it is usual to adopt some form of mineralogical grouping. Sov. systems have been proposed; one which is worked out very fully by J. J. Harris Teall is des-cribed in his British Petrography (1888); a very brief summary of crystalline rocks would include. (a) Rocks of ferromagnesian minerals, e.g. olivine, angite, horableado, blotite. Felspar is not present as an essential. (b) Rocks in which the felspar is essentially plagioclastic. (c) Rocks in which orthoclase is abundant. (d) Rocks containing nepheline and (or) leucite, both of which are absent in classes (b) and (c). (c) Other rocks not in the above four classes. Special classes are reserved for vitreous or glassy rocks, and also for fragmental volcanic rocks which may vary in texture from fine dust to large masses of scorks.

Distribution of typeous rocks. The

older I. R. occupy but a small aliquot part of the whole surface of the earth, nor are the existing masses of great extent. will be more readily understood when it is remembered that the exposure of plutonic rocks can only be brought about by immense carth movements and fractures, or by denudation removing the overlying strata so that the crystalline rocks may be exposed. In the case of the younger I. R. of the lava and fragmental types, these are being produced at the present day along the lines of volcanic activity, as, for example, in the Pacific girdle. Regions of extinct volcanoes also contain varying amounts of eruptive rocks, as in the case of the Auverane plateau of France and the Enfel mits, of W. Germany. By reference to a geological map the reader will readily identify the very numerous and widely scattered small masses of these rocks which exist on the surface of the globe.

Disintegration of igneous rocks .- Notwithstanding the hardness and compact character of those rocks, they are particularly subject to the weathering agencies. Chemical and mechanical analysis proves that all the materials building up the sedimentary rocks can be produced by the disintegration of the I. R., and, undoubtedly, many of the sedimentary rocks have been formed from such disintegration products. Chemical action takes place between the carbon dioxide of the atmosphere and certain compound silicates which results in the production of soluble carbonates and free silica, which latter may also be in a soluble form. Rain-water removes these products, and a mechanical disintegration follows. In the case of granite, the quartz is a simple compound, modable and consequently but little altered; on the breaking up of the granitic mass it is generally removed bodily by weathering agencies, and re-deposited to give a series of silicrous sedimentary rocks, e.g. sands, gravels, sand-stones. The felspar is subject to the chemical changes outlined above, which is termed knolinisation on account of the product kaolin or China clay which is composed of hydrated aluminum silicate separated from the felspar. The decomposition of the feispar results in the production of argillaceous sedimentary deposits, e.g. muds, clays, shales, together with soluble shea, which may be extracted by plants and animals, e.g. diatons and radiolaris, to build up their framework; the result-ma carbonate in each case will be dependent on the particular felspar which is decomposing; another will yield calcium carbonate, which in its turn may be extracted from its solution, and deposited to torm new strata of corals, chalk, limo-stone, etc. The mica suffers but little decomposition, and is usually re-deposited almost unaltered.

Ignis Fature (Lat., foolish fire), luminous appearance occusionally seen in marshy places and churchyards. It is usually visible shortly after sunset in autumn, and has been recorded in many countries. The light, which resembles a flame, is seldom pure white, and may be red, given, blue, or sellow Accounts differ greatly some observers speak of it as being fixed and others as moving Experiments have proved that it is not due to true combustion. The ories explaining its occurrence have been in turn discredited. These include the burning of methane or marsh gas, phosphuretted hydrogen, and phosphorescent vapour Many local names are given to the phen omenon, e.g. Will o the Wisp. Jack a Lantern etc. and its manifestations have given rise to a waith of story and legend.

Ignoramus (1) Word formedly witten on a bill by a grand jury (see Ind ICTMINT JURY) to usually that they ignored the bill on the ground that there was not sufficient evidence to authorise them in finding a true bill. I later they in dorsed the bill in I ng 'Not Lound' No Bill or with similar words. (2) Ignoring person especially an ignorant pretender to knowledge. In this councition the word was probably an extension of its appropriate legal incaming. Many writers notably Beaumont and Carlyle are found of using the word in a personified sense pryden in his Duke of Guise pure on the legal sense, thus 'Let ignoramus juries find no traitors, and ignoramus juries find no traitors, and ignoramus juries soribble satures. The idea of Dryden satire called The Widal which appeared in 1682, is said to have been singrested to him by Charles II 131 reply to the striking of a medal in honour of the I of the grand jury in throwing out a bill against Shaftesbury, always a butt of the poet laureate.

Ignorance, in law It is a legal maxim that I of a law is no excuse for breaking it however prai eworthy the motives of the lawbreaker. This maxim is said to rest on the legal prosumption that every man knows the law It would be truct to say that grounds of public policy have di-tated the necessity of thering to such a maxim. I of fact is different for example, if a man whose wife was living left her and married another woman under the impression that it was liwful in certain circumstances to have two wives would be guilty of big inv but if he did so under the impression that his first wife was dead, he would in all probability be excused. There are how ver dieta to the effect that the rule is not universally applicable at all events where no crime has been committed or during inflicted and that a judge in a court of c justy will be influence I by a plea of I

Ignorantines, name of a religious finter it in the Rom Catholic () arch in quality known as the (hristian B) offer founded at Rheims (1679) its am being the gratuitous instruction of poor hildren in both sacted and secular learning. It was organised (1683) by Jean Bartiste de la Salle The order has now spread over the whole world The brethen take vows of chastity obedience, and poverty, but do not enter holy orders. Their official title is the Brothers of the Christian Schools.

Igualada, tn of Barcelona prov, Spain, on the Noya, 32 m N.W of Barcelona. Pop. 10,500.

Iguana, genus of tropical Amer lizards, of the family Iguanida, comprising about fifty general to 100 species. Nearly all the general belong to the New World, occurring us fully by Patagonia and in a northward direction as far as chifornia and But Columbia and most of them are arboral though some live on the surface of the and and stones of the desert. They

soquences entailed by it in regard to the right to succeed to property. Bastardy in England and Wales has, however, lost much of the stigma traditionally attached to it by reason of the Logitimacy Act, 1926, which legitimates the offspring of unmarried paranta under the offspring of unmarried parents under specified con-ditions (see further under LEGITIMACY, LEGITIMATION).

In the census period 1871-1901 the percentage of illegitimates in the U.K. was

of Cancale are exported. The chief minerals are granite (round Fougers), related and argentiferous galena at Bruz.

St. Servan and St. Malo are the chief ports. Area 2697 sq. m. Pop. 578,200.

Illegitimacy, status of a child born out of wedlock. The status is especially important in all legal systems from the consequences entailed by it in regard to the affiliation. of lexitimate and illexitimate offspring is open to doubt. Most Aryan nations acknowledged illegitimate children as part of their families, and gave them a right to share in the patrimony, though in the Rom. law of succession illegitamate children were in a less favourable position in unmaried parents under specified conditions (see Jurther under LEGITIMAOY. LAGITIMAOY. LAG

Christianity may well have done no more than throw the egis of religion over what had long been a social commonplace; but the stigma it attached to infidelity to the marriage vow, and its doctrine that monogamous marriage was the only form of marriage that could exculpate intercourse, may well have gone far to stereotype the unenviable position of the bastard. Although eccles, ideas of marriage and legitimacy were slow in permeating the ruder Celtic nations, they soon induced the A.-S. law-giver to deny to the bastard any claim of blood relationship with the Magth or family. Some have even attributed the curious custom

The loss of social caste does not seem to have attached to the degradation of status incident to I until somewhat later. Some medieval heroes of aristocratic if spurious birth appear to have prided themselves on their title of bastard.' The Conqueror was known as Win, the Bastard, without any connotation of shame, but rather as a distinctive appellation. But apart from exceptional instances, social inferiority gradually followed as a necessary corollary to deprivation of proprietary rights. From an examination of the ann. reports of the Registrar of births and deaths, it will be found that in England the percentage of illegitimate births is later. Some medieval heroes of aristo-

deaths, it will be found that in England the percentage of illegitimate births is comparatively high in the E. cos. of Suffolk, Norfolk, and Lincolushire. It may be taken generally that the percentage is higher in agric, areas than in industrial cos.

The table above gives the illegitimate births per 1000 births for various countries

for the year shown against each.

came into conflict with the Iroquois (1678).

came into conflict with the Iroquois (1678). They now number under 200, and are situated on a reservation at the Quapaw Agency, Indian Ter. See J. B. La Salle's account of his explorations (1670-82); G. Catlin, North American Indians 1842. Illinois, riv. of U.S.A., formed by the union of the Kankakee and Dos Plaines Rs. in Grundy co., about 10 m. from Morris, Illinois. Rising near Lake Michigan, it flows S. and S.W. through La Salle co, entering the Missigpipi about 20 m. above Alton and the Missouri's mouth. Length about 500 m., navigable for steamers 250 m. to La Salle, whence a ship canal connects it with the Chicago R. and the Chicago Drainage Canal, and Penra are the chief cities on its banks.

hence with the Great Lakes. Ottawa and Peoria are the chief cities on its banks. Illinois, one of the N. central states of the U.S.A. known as 'the Prairie State,' situated in the valley of the Mississippi and the basin of the Great Lakes. It is bounded N. by Wisconsin, E. by Lake Michigan and Indiana, S.E. by Kentucky, S.W. by Missouri, W. by Missouri and Iowa. The Missispipi R. is on the W. the Ohlo on the S., and the Wahash on the E. frontier. The surface is a vast plain,

with an average elevation of 500 ft., sloping slightly towards the S. and S.W. Cairo is the lowest point (267 ft. above the guif of Mexico), Silver Creek one of the highest (1145 ft.). There is a low, fortile plateau in the S. known as Egypt. The Great Prairie (200 m. long) is in the centre. The Illinois is the chief riv., and there are saline, subhur, and chalvheate springs in saline, sulphur, and chalybeate springs in the S. The Illinois and Michigan Canal, connecting Lake Michigan and the Great Lakes with the Mississippi was constructed between 1830 and 1850. There is a difference of about 11° F. in the temps. of N. and S. The soil is very fertile, but an N. and S. The soil is very fertile, but an underlying stratum of clay, which retains the rainfall, necessitates elaborate drainage systems. Trees have been extensively planted, and I. ranks next to Iowa as an agric. state. Wheat, corn, hay, and various other cereals are grown. Fruit, especially apples, pears, and peaches, is much cultivated, particularly in the hilly belt of the S. Here cotton is also grown successfully. There are good vineyards, the centre of the liquor industry being Peorla. Livestock are reared and fine dairy produce is obtained. Slaughtering dairy produce is obtained. Slaughtering and meat-packing is the most important industry, centred of Chicago. Fisheries are also carried on introly, pike, buss, salmon-trout, carp, sturgeon, and paddle-lish being plentiful in the rivs, and lakes. Bituminous coal is the chief mineral, the coal-field covering about 37,500 sq. m. In 1947 the coal output was 73,446,930 tons. Pig-Iron, petroloum, natural gas, sandstone, and limestone are also valuable. Building-stone is quarried chiefly in Monroe, Lawrence, and Decatur cos. Zinc, fluor par, Portland cement, gypsum, and marble are found. I. ranks third in mineral output in the U.S. The last figures on agriculture show that in 1946 figures on agriculture show that in 1946 the chief cereal crops were marke 514,368,000 bushels; wheat, 19,533,000 bushels; oats, 168,693,000 bushels; barley, ryc, and buck wheat are also grown. The output of soya beans at 75,036,000 bushels (1946) amounted to more than one-third of the country's entire output. Soap, candles, and pottery are among the chief manufs. I. ranks as the third repursaturing state in America. entire output. Soap, candles, and pottery are among the chief manufs. I. ranks as the third manufacturing state in America, giving precedence only to New York and Pennsylvania. Some of the most important the are Chicago 3,396,800; Springfield (State cap.). 75,500; Peoria, 105,000; Rockford, 81,600; E. The faults in the By antine art it car to be that, while th inherited Orient it splendour of colour ing in gold sud yer milion gave character to the general scheme of docoration the dissolubly connected and that so sense experience can possibly be an ultimate experience can possibly be an ultimate the Byantine art of ear to be that, while the Byantine art of ear to be that, while the Byantine art of embeddishing MS-4 either by pictorial ornamentation of with decorated letters and designs in gold and colours was much of the figures of the saints or other per and designs in gold and colours was much unprepossessing. The reaction set in with the development of the art in Italy in the minth and tenth centuries, and later in the ninth and tenth centuries, and later in the Frankish empire. The Carolinglan or Frankish art owed its attractiveness largely to the independent ('eltic element originating in Ireland. The Irish art dispensed almost entirely with the use of gold, and relied for its effect on its designs and borders of intertwined ribbons, tangled knots, and intricate patterns and private and begonders an ingle the whole spirals, and legendary animals, the whole being executed with marvellous precision and minuteness. The celebrated Lindis-farne Gospels in the Cotton Collection in the Brit. Museum form one of the finest examples of the Celtic style, though these were really productions of Scottish monastic settlements. The colouring of the Celtic style is less bizarre than the Byzantine, but the drawing of figures and objects is orude probably because, being native-born, it proceeded independently of all classical models. The Franco-Lombard art combined the best elements of the art compined the nest elements of the Celtic and Byzantine; a return was here made to the abundant use of gold. The pure ornament outweight the illustrations or miniatures, which latter, as before, generally relate to scenes or characters from the Gospels, and are executed in free-band to be left. rrom the Gospeis, and are executed in free-hand in the later Rom. or so-called 'de-based classical' style. Examples of Carolingian art are Lothair's Gospels, Charles the Bald's bible, and an evan-geliarium among the Brit. Muscum Harleian MSS. A radical change came over the art of illumination at the end of the twelfth century and the conventional the twelfth century, and the conventional style then elaborated subsisted for something like 300 years' Almost the chief feature of bibles of this period is the border, which generally takes the form of a frame of fanciful foliage or other device. Greater prominence is given to the characters or MS. itself during this period, and in consequence the double-column pages are occupied mainly with the closely written characters, the 'miniatures' written characters, the 'miniatures' having become nothing more than large initials containing in actual miniature a pictorial representation of some act or scene relating to the corresponding text. Numerous examples may be found in the small bibles of the period. By the four-teenth century greater skill had been attained, not only in the more agreeable delineation of the human form, but in the representation of ornamental foliage. Scenery begins to appear, and the stiff and even grotesque contortions of the Byzantine figures yield to a free and dramatic arrangement or grouping, while the tawdry gold background disappears altogether. Skill in realistic drawing, however, tended to the destruction of illumination as an art in itself, and from the perfection attained in the Middle Ages the decorative execution declined to a style characterised by miniatures treated with admirable skill, hordered with gold, and interspersed

set in Brit. Museum. With the Renaissance in Italy and the return to classic models the art of illumination attained its zenith in minute delicacy of colouring and perfectiveness clement of drawing, and, furthermore, an official recognition by both the republican princes and the various popes and doges. Ultimately, however, it was the invention of printing that destroyed the art and reduced it to the mere pastime of painting miniatures in spaces left for the purpose, rather by way of subsequent adornment

than as an art in itself.

The Brit Museum has no true classical illumination, the few surviving specimens of which must, according to Dr. Arundell Esdaile, be sought in Italy; while the remains of the Cotton Genesis, fifth or sixth century, belong to the Byzantine School. But 'in work of all the later schools, down to the decay of the art upon schools, down to the accay of the art upon the rise of printing, the museum is abundantly rich, not only by grace of the foundation collections, but by gifts, bequests etc. Fine examples of the Eng. school of I. M. recently acquired include: school of I. M. recently acquired include: The Appealupse of the Abbey of Abingdon (thirteenth century), acquired in 1931; The Psalter of the Abbey of Eresham (thirteenth century) purchased and presented in 1936 by the National Art Collections Fund; The M. R. James Psalter (fourteenth century) written for use in 19nrham diocese, and presented in 1937; The Luttrell Psalter (g.r.) acquired in 1929: The Bedford Hours and Psalter. in 1929: The Entirett requirer (q.r.) bequired in 1929: The Bedford Hours and Psaller, a book by an Eng. artist and not to be confounded with the more famous Hours (Add. MS. 1830) also executed for John, Duke of Bedford, and of Fr. workmanship. It is, says Dr. Esdaile, one of the finest examples of the school which arose and flourished for a time after the Black Death and was the end of Eng. illumination and it is unique in containing over 300 exqueste miniature heads, which may be portraits.' The Museum secured it, when auctioned, for £33,000 (see A. Esdalle, The British Museum Library, 1946).

illusion, term loosely applied both to delusions and hallucinations, or, in other words, to perversions of the senses and perverted deas. Psychologista differ as with devorly painted flowers and insects, to the more appropriate application of while the text assumes a place of merely secondary importance. One of the best camples of fifteenth century illumination is the Bedford Book of Hours, now in the

the sensations of sight and causing the subject to see what are commonly termed visions or appartions, and defining I as the false interpretation of a sensation actually perceived. Dr. Ferrier, while including both under the generic name of ls., differentiates between an I. of the senses and a delusion of the mind. defines Is, generally as sensations without a corresponding external object, giving the names spectralillusion, phantom, or phantasm where the eye is or seems to be the seat of sensation, and the term rivid idea or conception when the I, is due to an act of ideation. The whole distinction is sharply drawn by regarding an I. as a mockery, false show, or deceptive appearance, and an hallucination, delusion, or 'illusive transformation' (Ferrier) as a chimerical thought. Popularly, any transformed appearance of a real object, any appearance without a corresponding physical or external object, and any distorted, exaggerated, or nusconceived notion or idea constitute is. The distinction is important according to Dr. Tuke in regard to insanity, because, while the sane may easily transform a real object into something to Lad it is, the perception of an object externally projected without the slightest corresponding reality indicates some serious disturbance of the nervous system. Both Is, and delusions, however, are consistent with sanity. A scientist closely concentrating his mind and senses on some experimental work may well have visual and auditory Is, conjured up by a subtle interaction of some external object upon strained or expectant senses, without thereby being mentally diseased. Is, may occur quite early in life, and are more common in males than females. According to Dr. Ferrier, some who have experienced Is. indicates some serious disturbance of the Ferrier, some who have experienced Is. have been remarkable for active memories, great ability, and extreme sensitiveness, while of hers were by no means so endowed. and, again, some are in perfect health, while others are suffering at the time from either triffing indispositions curable by dicting or from serious inflammatory and febrile diseases. In the criminal law (q.r.), the term delusional insanity appears to embrace Is. and hallucinations into embrace 19, and managinations in differently, provided the reason is involved. See D. Tuko, Dictionary of Psychological Medicine, 1922; T. and J. Beck, Medical Jurisprudence, 1838; W. Guy and D. Ferrier, Principles of Forensic Medicine,

1881.
4 Illustrated London News, founded by nowsneed of Nottinga small printer and newsagent of Nottingham named Herbert Ingram, and generally said to be the first illustrated news-paper over pub. The first number was brought out in May 1812, and among the earlier of its artists were John Gilbert. John Leech, and Birket Foster. Its first notable editor was Charles Mackay and among its most distinguished contributors have been Mark Lomon, George Augustus Sala (Sement Scott, and Andrew Lang.

of the brain affecting the remembrance of walls of sepulchral chambers and the pil. lars of temples with the exploits of their kings, and the Assyrians told the story of their great wars and sieges on the friezes of their monuments; but in the modern sense I, may be defined as the pictorial presentation of an idea expounded in an accompanying text. It is thus an accessory to the printed word, although in the hands of a skilful artist the two may often be aesthetically indivisible. This article attempts to deal only with book I. (For the medieval illuminated MSS. see ILLUMINATION OF MSS).

The earliest L's were block prints, such as the St. Christopher (1423), which were usually of religious subjects and which made their first appearance in Europe at about the same time as the invention of printing although probably independently of it. These blocks were woodcuts, having the design cut with a knife in relief on the plank surface of a soft wood. Any accompanying text was also cut in the same block. At a later date the prints were pasted together to form books, a few of which are still extant, notably the Biblia Pauperum (c. 1465). One of the earliest books printed from movable type to contain woodcut I.'s was Aldus's Hymurotomachia Polifili (1499) (q.r.), and not long afterwards Botticelli executed his admirable designs for Dante's Dirina

BANS HOLBERY THE YOUNGER 'Death of the Duchess' from The Dance of I)e t.h. 1538.

Commedia. Broadly speaking, I. experienced the same up- and downs as painting, and whenever an important school of the greater art was then, too, the lesser art flourished. Thus the It's Pollaguolo and Muntegna not only painted but executed a number of excellent line engravings. In Illustration is as old as art itself. Two dermany, Durer and the younger Holbein or three thou-and years before Christ, and exploited the method, and the latter's earlier still, the Egyptians adorned the book Dance of Death is his most notable end of the fifteenth century

Copper was first used for engraving about 1477 but the method was not intro duced into Angland until about 1540 when it gradually superseded woodcuts Unlike the latter it is an integlio process The design is cut with a built, or graver. on to a polished copper plate which is then inked over and the suifice wiped clean, leaving the ink in the received meisions leaving the ink in the icce sed incisions ander pressure the ink is trustered from the plate to paper. I included may be reproduced by this method and it was widely practised by timous artists for book. I up to the nimeteenth century, notably by the school of Rembrandt in Holland, and of Wattean and Frizon and in France, and later by Hogarth and Reynolds. The aquatint, the on intaglio process but capable of suggesting tonal variation, was used by Rowlandson to great effect in his Inglesh Dance of Death (1816) and Iours of Doctor Syntar (1812). The drawing was done by the artist him self and the prints from it were then haudcoloured by professional colourists

But Greenway's studies of claiming culding in mobile of and long skut and Randolph Caldecott's gas hunting seenes were, and are still tamiliar

The advent of photography in the last decades of the imeteenth century as a medium for reproducing drawings was to revolutionse the whole field of I -m'ag ho, plane taplue and telef Among the first to exploit its possibilities was Aubicy Beardsley whose brilliant black and white drawings were reproduced by means or name by 'vite's used for all it is trength. It is treated as an interest late which is then the dearms the state of the treated metal to that it can a here much are plate which is then the dearms the state of the original of the drawing which are acid to the effects on a wider variety of inest of the drawing which are acid to the effects on a wider variety of point surface, and printed in the same way as a wood cheraking. In in age of increasing committed about this process had the advantage of speed, and from the artist's point of view it had the mental state of the considered the activity bugbear of half one other photons who is a point of view it had the mental state of the considered the activity bugbear of half one other photons who is a point of view it had the mental state of the considered the activity bugbear of half one other photons who is a point of view it had the mental state of the considered the activity bugbear of half one other photons who is a considered the activity bugbear of half one other photons who is a considered the activity bugbear of half one other photons who is a considered the activity bugbear of half one other photons when a considered the activity bugbear of half one other photons when a considered the activity bugbear of half one other photons when a considered the activity bugbear of half one other photons when a considered the activity bugbear of half one other photons when a considered the activity bugbear of half one other photons are considered the activity bugbear of half one other photons are considered the activity bugbear of half one other photons are considered the activity bugbear of half one other photons are considered the activity bugbear of half one other photons are considered the activity used for a considered the activ

reproducing his original drawing in any desired size, and the original itself was not distroyed in the process. This was soon followed by the arrival of the half-tone process which was a method of reproducing continuous tone subjects such as photographs. In principle it is the same as the line block except that the negative which is to be printed on the inital plate is fit-t broken up, by exposure through a cress hard screen into a series of dots of varying sizes creating an illusion of tone (clon d originals are readily reproduced by the half tone traces by moone of by the half tone process by means of colour filters which break down the tones of the original into their three primary climents. Separate half fore plates are made of each and superimposed in print ing to recreate the colours of the original in that true values. The process is capable of reproducing a wide range of subject both in monochrome and colour and is us d for nowspaper I and very widely to reals. It can give very fair repre-sentations of pencil and erayon drawings by the use of peeral etching techniques it was the artist great scope in that the duction of his original is mechanical, leav ne him with no medium to be cone or d. Against this must be set the feet that the last tone screen ultimately gives COd

To main reasons for the married and renewes as intert here and then of the screen to pro-lug variations of that strength of the wildy used for of any ork and in this

be mentioned briefly at this stage. Collo- p type, like lithography, is a planographic method of printing (i.e. from a flat surface), but unlike any other method it dispenses with a screen for reproducing tones. It can reproduce fine 1.'s with great fidelity both in black-and-white and in colour, but owing to the instability of the printing surface it deteriorates rapidly and is therefore confined to printing small eds. The process excels in the reproduction of works of art, where, with as many as seven or eight printings, a result is obtained which can be achieved by no other process.

In view of the acknowledged limitations of photographic methods it is not surprising to find an antithetic tendency at work among present day artists over the whole field of book I. This manifests itself in a return to carlier craftsmen's methods, notably in the flourishing schools of wood engraving; and much line work is also being done by autolithography. Earlier in the century the work of various private presses did much to revive and encourage good craftsmenship, and in this connection should be mentioned the work

of Eric Gill and Robert Gibbin's at the Golden Cockerel Press. The ed. of The Canterbury Tales from this press is a fine example of the work of Gill whose chasical spirit combined with great skill as a de-signer of lettering and typefaces in many instances resulted in a harmonious blending of I. with the printed text. Chaucer, the inspiration of sev. modern illustrators, has also been pub. in a fine cd. with colour plates by Russel Flint, and in America with wood engravings by Rockwell Kent. Another Amer. much of whose output has lambas.

appeared in Great Britain is E. McKnight Kauffer who has done much imaginative work in the field of advertising as well as in book I. Of the latter his L's for the Nonesuch Press Don Quicote should be mentioned. This press has contrived to produce books matching in quality those from the private presses, but, by making the best use of modern mechanical methods, to publish them at comparatively cheaper prices. Other artists who have done fine work in wood engraving are Paul Nash, Douglas Bliss, Clare Leighton, John Farleigh, and many more. Lincleum, too, has proved an excellent medium for either black-and-white or colour 1, and two artists who have worked successfully m this medium are Claudo Flight and Wm. Kermode. Autolithography has seen a welcome revival, and in this connection should be mentioned the work of Barnett Freedman (especially a series of his coloured L's for Tolstoy's War und Peace), John Nash, and John Piper.

The constant development of new processes of book I. (as for example the recent application of plastics to lithography) tends towards a new synthesis of the craftsman and the machine, with the nim of achieving the maximum fidelity of reproduction while allowing the greatest reproduction white anowing the growest scope to artistic technique. SCRIPTS.

Illyria, name of a vaguely defined mountainous dist. on the E. coast of the Adratic, running from Durazzo in Albama up to Finne in Istria. Inland the line up to Finne in Istra. Imana the me was still more indefinite, but it may be regarded as including the N. parts of Albana. Montenegro, part of Serbia W. of the Morava, Dalmatia, Boshia-Herzgovina, and part of Croatia-Slavonia. The Rom. prov. of Illyricum vaned in area from time to time, and no struct governableal limits can be assigned strict geographical limits can be assigned to d. In early (ik. hist, we only know of the barbarian 'Hlyrians,' whose legendary ancestor was descended from Cadmus and Harmonia; archeological research shows that the primitive peoples spoke a Venetic didect, also Meroapian, akin to modern Albanian. Gk. colonies were settled all along the coast during the whole of the sixth century B.C., and coins and inscriptions have been found at Durazzo (Epidamnus), Split (Salona), Dubrovník (Epi-daurum), etc. The inter-tribal warfare seems to have been checked by Celtic pressure in the fourth century, and a con-tederation was formed which pressed on Macedonia. Under a chief Bardylis, and his son, Clifus, Amyntas was defeated, and later Perdiceas. Philip of Macedon thually crushed them. The tribes turned to piracy and harried both Gk. and Rom. trade. Their queen Teuta insolently refused terms, and murdered the Rom. ambas. In 180 B.c. an independent republic of Dalmatia was estab., and the kingdom of the Illyrian Genthius was annexed to Rome, 168; Dalmatia con-tinuing aggressive and powerful till A.D. 9, when the whole country became a Rom, proy. It furnished some of the best soldiers for the Rom, armles, and many of the emperors were Illyrian by birth. In A.D. 379 E. Illyricum went to the Byzantine empire. The ethnological character of the dist, was modified by the Humish invasion in the fifth century, and in the seventh century by the Slavonic immigra-tion of Croats and Serbs, though the coast tns. still remained It. in civilisation. The primitivo races remain in Albania alone. in 1809 the Hlyrian prove, were formed and ceded to Italy: they were conquered by Napoleon and ceded to Austria in 1813, and till 1849 formed a kingdom of the Austro-Hungarian empire. See also Y CGOSLAVIA.

Illyricus, see Flacius, Matrilias. Ilmen, lake of Russia in the region of Novgorod, R.S.F.S.R., 30 m. in length from E. to W. by 21 m. in greatest brendth. Its chief trib. is the Lovat. It discharges its surplus waters by the Volk-

hov northward into Lake Ladoga.

Ilmenau, th. of Thuringia, Germany, it is situated at the N. foot of the Thuringian Forest on the R. Ilm, 30 m. by rail S. of Erfurt. The tn. is a favourite the control of the control watering place, and was visited by Goethe, who wrote his *Iphigenia* here. Pop. 16,100. Ilmenite, titaniferous iron ore found in

many localities, more particularly Krageroo in Norway, where good crystals occur, in the U.S.A., and in Canada. It has been found as sand on the banks of the Mersey, and at Helston in Cornwall. The name is derived from the Ilmen Mts. (Urals), where it is found in magnificent crystals. Its formula is generally given as FeTiO, but in many cases the mineral contains magnesium, so that it may be written (Fe,Mg)TiO₃. It is not isomorphous with heenatite, but belongs to the parallel-faced hemiliedral class of the rhombohedral system.

Erfurt. Pop. 12,000.

Imac, see under MALACHY, SAINT. Image-worship (Gk. είδωλολατρια), the use for private or public devotions of graven or painted representations of sacred persons or things, to which honour and reverence are given instead of to the invisible Godhead. The term is sometimes taken for the use, as in the Rom. Church, of pictures or images which are only designed to convey to the worshippers an idea of that which they worship, but it is more often limited to the sense of meaning the actual worship of the image itself, not of that which it represents. I, was a comparatively late development of primitive religion, and grew out of the earlier fetish worship, in which a stone or a wooden post was worshipped with the idea that the spirit of a god had entered there to receive sacrifice (cf. Asherah, Ex. xxxiv. 13). The making of images in some definite form marks a great advance in religious thought and shows the birth of conceptions of the Divine character and attributes. Varro aillrins that for more than 170 years from the foundation of Rome there was in the city no image of a god either in human or animal form, and god effect in human or animal form, and historians have proved that neither in Greece, Persia, nor Egypt, were there temples or idols in the earliest times. The Decalegue begins with the command to recorner the one true God and to recog-sic another delties, but the largest nise no other deities, but the lamentations and the demnnciations of the prophets show how thoroughly the cults of other deities were rooted in the hearts of the Israelites, how hard it was to root out the idol-worship traditions of their Semite ancestors, and how easy it was for them to anopt the gods and the graven images of their Canaanitish neighbours (1 Kings xi. 8; Jer. xii. 18). The Jewish worship of idols was checked but not cradicated during the Exile, and various passages in the labored demonstrate the tendency of the Jews to adopt the gods of the Gks. and Roms., and more especially those of their Oriental neighbours. To prevent such relapses all association of Jews and Gentiles was rendered difficult, and by degrees the former were weaned from idolatrous worship. Neither in the N.T. nor in any genuine secular hist, of the first century of Christianity can any trace be found of the use of images in the worship of the Christians, and though images of Christ, His Mother, and the Apostles are to be found in the Rom, catacombs, it was not until after the estab. of Christianity under Constantine that the practice be-came common. For the use of images in the Rom. Church, see under ROMAN CATHOLIC CHURCH. See also the series of

kneyelopaedra of Religion and I thies,

wat h making, etc. There has been a long term general rise of I in the last critury, and indeed (with certain isservations) it is an inevitable sign of social and conomic progress throughout the world Contrainer, it is a sign of bu ward movement and an unwholesome state of the nations when there is too stringent a watch upon the immigrant

but there is another side to this matter as long as nations are at so many different st ges of development, and the problem of the 'undernable alica' first faced the icference to a child that was to be born as a sign from God that hid should not be destroyed by Syria and I phraim. The mane occurs again in the Gospel of St. Matthew (1.23) when it is applied to Jesus the birth of the Me sual being taken as a fulliline it of the 11 ophics of fissible marked by the minimisers of the Messal being taken in the minimisers of the minimisers of the Messal Benefit (17) to the 1840, for you and the right of the minimisers of the Messal Benefit (17) to the 1840, for you and the right of the minimisers of the Messal Benefit (17) to the 1840, for you are the minimisers of the definition of the construction of the sound of the sound of the construction of the sound of the sound of the construction of the sound of the sound of the construction of the sound of the so In 1889 a committee of the House of in 1302 a loval Commission reported on it the resulted the framinal Allens Bill 1904, and the Alens Act, 1905 This ıt Aliens Act stated that an immigrant would b feld to be undestrable and could be repaired if he could not show that he was able to su port hims it and depend int if he was an idet a lunatic or suffing from disabling infilmities

the country which first coped with the t blem on the lirge t scale was the i i b ied 170,570 In the caring years of list cutting the in imprants to the list cd States came it inly from Britain and Ireland Pelits il opditions and the in thou of 1818 is disany Gers to be to America, and the flow continued the development of America's railway ten and opening up of farm lands in wheole from all pirts of W. Europe low reds 1900, mean is from S. and E. I mope began to redominate. Austra limingary, italy, an illussia furnished half the total numb. This caused an active among and the native America. who had even objected to the Irish in tormer years, and had declared that they however, always a tendency in the ordi-France, driving thousands of r. Protest hants from his country. Many of these went to Prussia, and were hospitably received by the Prussian king, and estable the property of which they contributed by their varied the old Duth families affected to despise the newer Eng. settlers. The Act of skill and industry. Others came to 1882, already mentioned was followed by

the Undesirable Persons Act of 1891, providing that every person arriving from abroad was to be examined and prohibited from landing if found to be a convict, lunatic, idiot, epileptic, contagiously diseased person, pauper, polygamist, prostitute, or auarchist. Allon Contract Labour Laws of the '50's and '90's pro-hibited anyone coming to the States to do any work under contract made before Exceptions were made in certain artistic professions. In 1921 a Quota Law fixed a definite number of immigrants for each nation, and in 1924 this Act was stiffened. In 1929 Britain was given the stiffened. In 1929 Britain was given the lead in its quota, but the total was further reduced. During the financial year 1930-31, 97,000 immigrant aliens were admitted into the U.S., against 241,000 in the previous year. For the first time since the Amer. Civil war, the ann. total was under 100,000; and it was evident that the States had abandoned their historic rôle of giving hospitality to the distressed and personnel the world over nistoric role of giving hospitality to the distressed and persecuted the world over. Of these 97,000, nearly 27,000 were from Canada, 9,000 from Britain, and 7,000 from Ireland. 13,000 came from Italy and 10,000 from Germany. Only 51,000 came in under the quota; the rest were from non-quota countries, chiefly Canada. In 1932 only 35,70 were admitted. The In 1932, only 33,570 were admitted. The increase of Chinese in America was also regarded with jealousy. It grew with the extension of the railway system, the discovery of gold in California, and the development of the Pacific Coast. The Chinese worked for far lower wages than would support a European and the gold. would support a European, and the agiwould support a European, and the agritation against them led Congress to suspend all Chinese I., by a series of Acts ranging from 1882 to recent years. In 1882 there were 130,000 Chinese in the States, but by 1920 only 62,000. They occupied mostly domestic situations, or worked in small shops, canneries, and laundries. Jap. I. to the U.S.A. began in 1869. They entered the country freely partit 1908, and numbered 30 000. but until 1908, and numbered 30,000; the diplomatic measures of the Jap. Gov. reduced the figure, and it was further diminished under Alien Laws. By 1921 it was 7878.

In 1938 the Brit. emigrants to the U.S.A. In 1938 the Brit. emigrants to the U.S.A. are given as 1992, and in 1947 they had risen to 18,555. It is to be noted that such figures are very easily confined, through certain statistics lumping all passenger traffic together. But it can be stated that the total Brit. tourist movement by sea to the U.S.A. in 1917 was 40,959. This compares with 51,000 visitors from the U.S.A. to Britain, restrictions. 40,959. This compares with 51,000 visitors from the U.S.A. to Britain, recorded in the same year, 1947. There were 3000 from Central and S. America in

1947.

Brit. colonies, or dominlons, have generally found it necessary to pass Acts to control I. The Australian Act of 1901 imposed similar tests to those mentioned in connection with Britain and the U.S.A. in connection with Britain and the U.S.A.

A language or educational test was included, and rigorous laws and regulations
were made as to the employment of
Chinese coolies, once engaged largely in
the cultivation of sugar-cane in Queens-

land. Similar legislation broadly applies to New Zealand. Other old Acts were the Contract 1. Act, 1905, and the Re-striction Acts of 1906, 1910, and 1912. New Zealand satisfactorily absorbed large numbers from Britain, and its pop., like that of Australia, became 98 per cent Brit. Excess of immigrants over end-grants was 14,219 in 1913, though by 1928 this balance was reduced to 443. 1928 this balance was reduced to 443, Owing to the loss of 60,000 men in the First World War, a plan was formed in 1920 to recruit and assist immigrants, particularly from Britain. The number of Brit. immigrants into Australia was 77,934 in 1913, 70,271 in 1926, 13,851 in 1928. In 1947 it was 13,012; and 5918 to New Zealand. The official handbook, Know Instratia (1916) stated that Australia was the first of the countless of Know Australia (1946) stated that Australia was the first of the countries of the Brit. Commonwealth to announce a the Brit. Commonwealth to announce a full policy of planned I. She had set a target of 70,000 new citizens a year, 'thinking first of Britain and then of Allied countries.' S. Africa passed similar laws to those of Australia. The question of the Clinese became of great importance there, because native labour was in-sufficient to supply the mining industries. The Brit. Gov. in 1904 passed an ordinance The Brit. Gov. in 1904 passed an ordinance allowing the importation of Chinese labour, which was strongly opposed by the Liberal Party. In 1906 55,000 Chinese coolies were employed in the Rand mines, but the Transvaul Parliament abolished the system, and by 1910 had reputriated all the Chinese. By 1938 S Africa's I. policy was to attract suitable settlers with central and those was no denoral forms. capital and there was no demand for unskilled labour from abroad. The ligures of Brit. 1, into S. Africa were 25,855 in 1913; 30,293 in 1928; 26,142 in 1947. The Canadian Gov. in normal times has offered great inducements, especially to farmers, to settle in Canada, and in 1911 185,000 persons went there from Britain, subsequent measures of discrimination, like the laws of other countries, reduced the numbers to 83,886 in 1926, 89,571 in 1927, and 95,307 in 1928. In 1929, there were 58,880 Brit. imnigrants; in 1930, 64,082, and in 1931, 27,584. Many settlers also go to Canada from the U.S.A. The world-depression of 1930-32 resulted in the cutting down of those figures to a very low point. Jap. were limited severely and Chinese excluded from settling in Canada. (See also Emigrarion; EMPIRE SEPPLEMENT.)

I. on a large scale has taken place to the countries of S. America. In the Argentine Republic, the Homestead Law of 1917 aimed at relieving the irksomeness of colation in remote districts by placing together people having the same language. cu-toms, and traditions. Most of the immerants were It. and Sp., and the same preponderance has been true of Brazil. In 1916, the Peron Gov. of the Argentine Republic announced a long-term plan for closing to stress the vast complexity which has been added to the subject since the mass movements of refugees prior to the Second World War, and the countless difficulties of the present 'melting-pot' state of peoples throughout the world.
The following are some recent statis-

after-life being looked upon as little more than a continuation of the earth-life. An chain a continuation of the earth-life. An elaborate philosophy of the after-life is found in Egypt, and lengthy accounts are given in the Book of the Dead, telling of the descent of the spirits to the judgmenthall of Osiris. Reproductions of many of the pictures of these scenes are well known.

Immingham Dock, 5 m. N.W. of Grinsby, was constructed (1906-12) by the Great Central Rulway Company on the S. shore of the Humber. It has a capacity of 1,21,600 cubic ft., and an employed the Humber of the Albert of the Humber area with, adjoining property, of about 1000 ac.

Immortality (Lat. in, not, and mortalis, mortal, connected with mors, death), the continued existence of the human soul after the death of the body. In some form or other, the bellef in human I, is practically universal. In even the most primitive animistic cults its influence is clearly discernible, while in all the higher cults it forms an important section of their philosophy. In the more primitive cults we have the provision made for the journeys and sustenance of the departed 'soul,' the in the immediate demise of the crown,

gave use to the belief in the transmigration or souls. After death the soul passed into the body of some fresh being, higher or lower in the social scale, according as the life had been good or bad. Buddhism made no alteration in this doctrine, except that it furnished a final goal in the attainment of Nirvana, which, involving as it does the annihilation of personality, can bandt be described as I. It has been dis-puted whether the Hebs, had any idea of 1 before the exile, and there is much in the biblical books which would lead one to suppose that they had not (for varying conceptions of Sheol, see HVLL); it is certain that they considered the after-life as at most only a shadow of this life. Among the Hebs., the Persians, and the other semile tribes, the idea of L. is generally associated with the resurrection of the body. To the Giss., while many of them (e.g. Sicrates, Plato) held the L. of the soul, the resurrection of the body was entuch toteign to their thoughts. The unistrin faith teaches both the of the soul and the resurrection of the body. Paul (1 Cor xv. 44, etc. and to the First I pistle to the Thessalomana), teaches this ic all, and he also lay stress on the im-port of fact that the resurrection-body is ind cernal, but spiritual. See S. Salmond, Christian Doctrine of Immortality (4th ed.), 1901; R. Charles, Critical History of the Doctrine of a Future Life, 1897; J. Erdman's History of Philosophy (vol. 11., Since Henel), 1921; J. G. Frazer, Man, Got, and Immortality, 1927; J. Baillie, 1nd the Life Everlashno, 1934; H. Keyscrling, Immortality (1tans. 1938), Immortality (1tans. 1938), Corporations (q.r.) (including the king, who is legally a corporation sole) are, in law, incapable of dying. This is one of the reasons for the old mortimal statutes which were directed not cirnal, but spiritual. See S. Salmond,

old mortmain statutes which were directed against the conveyance of lands to eccles, corporations, it being against the policy of the law to allow land so to be tied up in perpetual ownership as to restrict the probability of its free circulation. The death of the reigning monarch is conatitutionally merely an event which results

though formerly there was a real interregthough formerly there was a real interreg-num between the death of one king and the election and coronation of his suc-cessor; with the result that the state had, in the interval, no one to represent it for the purpose of maintaining order. But this fictitious I. of the king did not get rid of the rule that Parliament was necessarily discolved by the death of the king aldissolved by the death of the king, although it was appreciated that the consequences of a sudden and automatic dis-solution were highly inconvenient, es-pecially in regard to taxes, the collection of which could not be enforced in the absence of a proper authorisation. It was not till 1837 that an Act was passed providing for the continued existence of Parliament for six months after the death of the king unless somer dissolved by his successor. For the other legal and constitutional effects of this attribute of I. in the king see Chows.

lmola, tn. of Italy in the prov. of Bologna, stuated on the R. Santerno. It is on the site of the Rom. in. Forum Cornelia. The cathedral dates from 1187. but was rebuilt in the eighteenth century. There is an anet, citudel and a fifteenthcentury palace. It has a considerable trade in wine. In the second World War the cathedral, the church of St. Dominic, the church of S. Maria in Regola, the civio museum and the l'aterlini Palace were all slightly damaged by bombardment, but, singury demerged by comparament, but, generally speaking, the tn. did not suffer very severely. Pop. 41,500.
Imoschi, Omotski, or Imoski, tn. of Yugo-Slavia, situated in Bosnia and Herzegovina, 30 m. N.W. of Mostar. Pop. about 40,000.

Impact, the collision between bodies. The muthematical theory of the subject is not concerned with cases in which the I. results in the destruction of either of the bodies. When two bodies impinge, the time of I, may be divided into two parts the first known as the time of compression, during which even the hardest bodies suffer temporary loss of shape at the point of impact; and the second, the time of restitution, during which the natural shape is regained. The more elastic bodies are those which exert a greater effort to re-cover their shape; hence they rebound further. An inelestic body is one which makes no effort to regain its shape, which is permanently altered by I. In actual practice, no perfectly inelastic bodies have been found; but a lump of putty is an approximate example. A common experiment to illustrate this loss of shape in the case of a hard body is made by dropping an wory hall on to a greased marble surface. A ciscle of distinct size is found to be made, and a still larger circle if the

to be made, and a still larger error if the ball is dropped from a greater height. Newton found that the relative velocity of two bodies after a direct I. is in a constant ratio to the relative velocity before I., and is in the opposite direction. This ratio has been found experiment-

contact. It is known as the coefficient contact. It is known as the coefficient of restitution, and in mathematical formulus is denoted by ϵ . Thus for two glass solids $\epsilon = 0.94$, for two very solids 0.8, and for one of iron and one of lead 0.13. The example given first approximates as nearly as anything else in practice to a state of perfect elasticity. The mathematical theory is based in the light place on considerations. based in the first place on considerations of the L. of smooth spheres and planes. When the surfaces in contact are rough, and the I. is not direct, rotations are set up, and the results have to be modified. First consider the direct L of two spheres that is, two spheres which impings in such a way that their line of centres is the same as the then two lines of motion. Let m, m_1 be their masses, u, u_1 their velocities before I., and v, v_1 their velocities cities after I. All velocities are men ared in the same direction, and if the spheres are moving in opposite directions u or u1 will be negative. Since at I. the impulse received by one body is equal and opposite to that received by the other, the momenta received are equal and opposite. Hence the total momentum in either direction in the line of motion is unaltered by I. Hence follows the equation $mu + m_1u_1 + mv + m_1v_1$. Again, Newton's Experimental Law states that the relative velotive velocity between two equations are e^{-u_1} . These two equations are then sufficient to determine r and r, the then sunction to determine rain r₁, the velocities with which the bodies move off after 1. Thus, in particular, a ball falling to the ground with velocity a rebounds with velocity e.u. It will rebound a second time with velocity e.u, and so on, when the L is oblique, the components of the initial velocities perpendicular to the line of centres at L are maltered. This gives two equations stated above hold equally for the components of the initial velocities resolved along the line of centres. and hence there are four equations which will determine the two new velocities and the new directions after impact. In the former case, the kinetic energy before impact is $\{mn^2, \{m_1n_1^2, and after impact is \} \} \{mn^2, \{mn^2, and after impact is \} \} = \{mn^2, \{mn^2, and after impact is$ $\frac{mm_1}{m}$ $(u - u_1)^2$. Hence this ex-

pression represents the kinetic energy lost by the I. It chiefly tempears in the form of heat.

Impanation, literally embodiment in bread (Lat. punis), a theological or eccles, term adopted by some of the earlier Protestants and used in the controversion in regard to the Real Presence of Christ's body in the bread of the Eucharist. applied to a local presence or inclusion of Christ's body in the bread after consecration, an hypostatical and personal union of the brend with Christ's body. It differs from Transubstantiation (q.v.), and has sometimes been used loosely as equivalent to Consubstantiation.

Impatiens, large genus of balsaminac-eous plants which occurs in warm and tropical countries, and is so called from the sudden and elastic force with which the

species burst their capsules. I. bal-samina, the common balsam, is well known in Brit. conservatories, and I. Noli-me-langere, the touch-me-not, is also a com-mon plant. The valves of the capsule roll inwards when touched, or fully ripe, jorking out the seeds, and the plant emits

an umpleasant odour.

Impeachment, arraignment before the High Court of Parliament of a minister of The first recorded everyise of the power was in the reign of Edward III., when Latimer and Neville were impeached for the fraudulent purchase of crown debts and for removing the staple from Calais. I. is a judicial proceeding in which the Commons act as a cusers and the Lords, in pursuance of the long settled rule that the judicial powers of Parliament are vested exclusively in the Upper Chamber, as judges. A member of the House of Commons moves the L in the first instance, and if the motion is carried the accused is impeached by a deputation of numbers at the bar of the House of Lords. Articles of I, are drawn up and copies submitted to the lords and to the The but then arrested and accused. detained in the custom of the Black Rod. The prosecution is conducted by certain of the commoners, who are styled managers. The Lords deliver a verdict upon agers. The Lords deliver a verdict 'upon their honour,' and where a verdict of guilty is found sentence is not passed until the accusers domand it. The prisoner may move the court in arrest of judgment. The Act of Settlement provides that no pardon from the crown can be pleaded to an I. Where the accused is a peer, the Lord High Steward (4,r.) pre-sides, where a commoner, the Lord Chancellor. I. is now virtually obsolete. Public opinion has for years been a far stronger inducement to ministers not to abuse their powers than the terrors of an I. Formerly, however, it was a valuable weapon in the hands of the House of Commons for controlling the actions of the crown ministers. But there is no doubt whatever that the power was grossly abused. Ministers were often impeached for reasons which in these days would merely form ground for strong party differences. Perhaps the most fam ous case of I. was that of Lord Chancellor Bacon on a charge of receiving bribes. This I. was important in that it re-affirmed the right of the Commons to hold ministers responsible for their acts to the nation. The Is. of George Villiers, auke of Buckingham in 1626, and Thomas Wentworth, earl of Strafford in 1626 and, Archbishop Laud in 1640 seem in modern eyes to do no more than exemplify the varying for-tunes of party warfare. One of the tance of party warfare. One of the adams any sign of receition (see Mommspecific charges against Buckingham was that of accumulating offices. In these days patronage in one form or another is a forequent subject of hostile party and Press comment, but the law officers of the crown would hardly suggest an I. Both Went would hardly suggest an I. Both Went would hardly suggest an I. Both Went wine, and olives. Pop. 146,000. (2) A city of Liguria, cap of the above prov., on subvert the fundamental laws of the charge does not alter the fact that Wontworth's foreign policy and Laud's papist tunes of party warmer. One of the specific charges against Buckingham was that of accumulating offices. In these days patronage in one form or another is a

views and sympathics did not happen to meet with the approval of a stern Puritan parliament. parliament. The last is, were those of Varren Hastings in 1788 and Lord Melville in 1806 for alleged malversation of office. But even before that time the principle of ministerial responsibility (see Cariner; Government) to Parliament had become what thow !s—the funda-mental safeguard of the whole principle of representation.

The procedure on I. is similar in the US.A., in which country the most famous case was that of President Johnson, in

1868.

Impenetrability is generally accepted a-one of the properties of matter, viz. that two different portions of matter cannot occupy the same space at the same time. When a null is knocked into a piece of wood, it takes up its new position by displacing certain particles of the wood. Many experiments were made to disprove the theory, notably one, in which a metal grobe was completely filled with water and then compressed until the outside was seen to be covered with moisture. But this was explained as merely proving that particles of water could be forced by tween the particles of metal. A pint of water and a pint of alcohol make a mixture of ics, than two pints, but this is due to the fact that in the mixture the mole cules are closer to one another. On the other hand, the many theories recently advanced of the composition of atoms make it doubtful whether they possess the property of 1.

Imperator, passenger and mail steamer of the Hamburg-Amerik i Line, launched by the Kalser Wilhelm II in 1913, but

later called the Berngara (q.c.).
Imperator, in Rom. hist, the title given, in the republican period, to the victorious general and laid aside with the surry inder of the military command; but, in 16 a.b., conferred on Casar for life. Char bore is at first as governor of Gaul in the usual way; but the retention of the title after the termination of his generalship and the celebration of his trumph, was new. Here was laid ground for a distinction between the permanent title, which was subse-quently prefixed to the name, and that which was temporary and therefore capable of repetition, which was placed after the name. But Casar, even when he had been called in the former some, imperator once for all, was yet after the gaining of victories, saluted by acclamation on the buttlefield as imperator; he never hore the title, however, prefixed to his name, out called himself and made others call him simply Casar imperator—without adding any sign of repetition (see Momm-

Imperial Air Routes. see Air Mail, etc. Imperial Airways, the name of the body formed, in 1921, by the four Brit. air-lines—Handley-Page Transport, Instone Air Line, Daimler Airway, and the British Marine Air Navigation Company. The board comprised representatives from the absorbed coys, together with directors appointed by the gov. Under the Brit. Overseas Airways Act the British Overseas Airways Corporation came into being in 1939, with 3 members appointed by the Secretary of State for Air; and in the following year the new corporation acquired the undertaking of 1. A. and of British Airways Ltd.

Imperial Bureau of Mycology, sec 1M-PERIAL MYCOLOGICAL INSTITUTE.

Imperial Canal, see GRAND CANAL. Imperial Chemical Industries, Ltd. great combine which controls a large number of other concerns, the chief of which are British Copper Manufacturers; British Dyestuffs Corporation; Brunner, Mond & Co.; Cassel Cyanide Co.; Castner-Kellner Alkali Co.; Excelsior Motor Radiator Co.; Imperial Chemicals Insurance; Kynoch Ltd.; Nobel (Australasia), Ltd.; Nobel's Explosives Co.; Sedgwick Gunpowder Co. and Welsbach Light Co. Its authorised capital is £95,000,000, and ite chief productions are acids, alkali, ammonia, artificial leather, chemicals, cycles; and motor cycles, detonators, dyestuffs, explosives, fortilisers, lime, non-ferrous metals, and safety fuses. The first chairman was the late Lord Melchett (q.v.); the ber of other concerns, the chief of which metals, and safety fuses. The first chairman was the late Lord Melchett (q.v.); the man was the acc Lord McGowan. The chief offices are Imperial Chemicals House, Millbank, London, S.W. (present office: Nobel House, Buckingham Gate, London, S.W. 1). Judged by world standards, I.C.I., with a normal estab. of 70,000 employees, is only comparable with simple ployees, is only comparable with similar chemical organisations in the U.S.A., but small indeed compared with the I. G. Farben of Germany and the State Corporation of Russia. The company's achievements in the invention and development of products and processes were of direct importance in the national war effort. Thus the company turned out half a million tons of sulphate of ammoria a year—essential to fertilisers and to the grow more food 'campaign. During the war almost 400,000 tons of explosives were made in the coy,'s factories besides hundreds of millions of detonators, fuses, and incendiary bombs. I.C.L's greatest contribution in the field of special weapons was the Projector, Infantry, Anti-tunk Gun, better known as the P.L.A.T. and the most effective weapon of the infantry against tanks or fortifications. Another weapon was the 'flying dustbin,' which, mounted on a tank, helped to blast a way through the West Wall and the fortified wils, of Normandy in 1944. On the coy. fell the borden of producing small arms ammunition until new gov, factories could be built; by the end of 1944 they had turned out over 3500 million rounds. They were also responsible for developing mass-production methods for the small arms incendiary bullet—a weapon which completely surprised the Gers. and caused as a private venture to students in Oct ..

them great losses of aircraft at a critical stage in the war. The cupro-nickel con-denser tube was a notable contribution to the increased fighting elliciency of Britain in the war and a large number of the bigger warships were fitted with tubes made by the I.C.I. A new factory was built to make metal fuel tanks for aircraft and, later, technicians developed the technique of making the tanks bullet-proof. Plastic materials were in great demand for war in the air; the coy, s invendemand for war in the air; the coy, 's inven-tion of 'Perspex' (see Chemistray; 'Plas-ries') was widely used as a non-splintering glazing naterial for aircraft. Polyvinyl chloride, another plastic, was useful to replace rubber in flexible cable coverings. An outstanding achievement in the field of plastics was the discovery of polythene or polymerised of hylene. It proved to be a valuable insulating material for high-fre-quency radio and television. Without polythene, Radar could never have been

developed so rapidly or so efficiently.

Imperial College of Science and Technology, a federation of three institutions: the Royal College of Science, the Royal School of Mines, and the Central Technical College of the City and Guilds of London (escentially a school of engineering), situated in S. Kensington. In 1906 an official committee proposed that these three institutions should be brought together in such a way as to establish at S. Kensington 'an institution or group of associated colleges of science and technology where the highest specialised in-struction should be given and where the fullest equipment for the most advanced training and research should be provided. in various branches of science, especially in its application to industry. Their report resulted in the creation of the I. C. of S. and T., with the three above men-tioned institutions as its constituents, the college as a whole being a school of the Univ. of London. Its predominant function in the sciences, mining, metallurgy, and engineering, is to train students for direct service in industry and agriculture.

The above mentioned institutions were themselves related to yet earlier institutions from which, accordingly, the I.C. tone from which, accordingly, the Locan claim descent. The earliest of all was the Royal College of Chemistry, and the Royal College of Science has its origin in the incorporation in 1853 of the gov. School of Mines and of Science applied to the Arts with the still older Royal College of Chemistry. Brit. chem. owes much to the enthusiasm of those who, a contury ago, saw their country's need of laboratories like those of Liebig and of Wholer at Glessen and at Gottingen, and endeavoured to obtain support for a new institution to be named the Davy College of Practical Chemistry. In 1843 they came near to success in an attempt to secure accom-modation in the Hoyal Institution; and in 1845, when that had falled, they organised a campaign of publicity among all classes. Their efforts were successful, for a constitution was given to the college; its first council was elected and Prince Albert became its first president. It was opened,

1845, in George Street, Hanover Square, [and on Dec. 9 its title was changed to The Royal College of Chemistry. The first prof. of this college was August Wilhelm von Hofmann, then a 'privat docent' at Bonn. Hofmann stayed till 1863 when he was appointed prof. of chem. in the Univ. of Berlin. In Holmann's tirt year of office the college moved from its temporary quarters in George Street to a new building in Oxford Street. The college binding in Oxford Street. The College was, as stated above, incorporated with the Government School of Mines and of Science applied to the Arts (founded in 1891, b) do la Berche, the famous Eng geologist (q.r.), on a site between Jermyn Street and Piecadilly), and later to become Street and Precamity, and Pitel to become the Royal School of Mines and, at S. Ken-sington in 1881, the Normal School (ulti-mately the Royal College) of Science. Assisted by Lyon Playfair Prince Albert secured the purchase, with funds at the disposal of the Commissioners of the Exhibition of 1851, of the site in 8, Kensington on which the Imperial College now stands. It was Prince Albert's initiative in urging the holding of the great Exhibition, against public opposition and without much initial support from industry, that was largely res vi for the fact that the commissioners had funds to spend on endowing the arts and sciences in this and other ways. The third constituent institution of the L.C., the City and Guilds College, owes its being to the corporation ! and Lavery Companies of the City of London.

But the steps whereby all three constituent institutions came at last to be associated at S. Kensington is a complex one, which may only be disentangled from numerous letters, memoranda, and do-partmental minutes, many of which are cloquent of divergent aims and interests. The major opposition was that which lasted from 1831 to 1881, between Huxley and the Science and Art Department on the one hand, and the 'mining school party' led by Murchison Perev and Warrington Smyth on the other. Huxley's party wanted a great metropolitan school covering all branches of applied science, but the other party feared that extensions would hinder the development of de la Beche's school in Jermyn Street and lose its affiliation with his Museum of Practical Geology. But these divorgencies were gradually reconciled, particularly as accommodation became more common-surate with the teaching given. The fluctuations of this story are shown in the ceasoless changes in the names attached to ceasoless changes in the minus according to the constituent colleges, and it was not until 1907 that the three came to have their present names. The L.C. of S. and T. is a 'peak institution' comparable with the Massachussetts Institute of Technology, and the 'alliance' concluded with that institution in 1944 was a recognition of community of aims and interests. Its Charter estab. it 'as a School of the University of London' and its Visitor is the king.

The Charter of the college provides that, subject to agreement with the authorities of any college or other insitution, the Committee, constituted in July, 1929, on

governing body may recognise that college or institution or any dept. of it as being in association with the f. C. for all or any of the purposes of the Royal Charter of 1907, but no such resolution is to be opera-tive until allowed by the King in Council. The Dept. of Metallurgy of the Univ. of Sheffield has been so recognised for the Advanced Metallurgy of Iron and Steel.

The I. C. is organised into these depts: aeronautes (including aerodynamics); biological depts, (including biochem., botan', and zoology) chem. technology (including chemical engineering, fuel and refra tory materials, applied physical chem.); chemistry (including organic chem., morganic chem., physical chem., agricultural chem., and the chem. of food and drugs); engineering, mechanical and motive power; engineering, civil and surveying (including highway civil and surveying (including nighway engineering); engineering, electrical; engineering, chem.; geology (including nuturing geology, and oil technology); noathematics and mechanics; inctallurgy; including minima surveying); mining (including mining surveying) physics (including astrophysics, technical optics, instrument design, meteorology, and applied geophysics).

The administration is vested in a Governing body of forty-seven members representing the Crown. India, the selfgoverning Dominions, the Board of Edu-cation, the Univ. of Loudon, the London Co-Comeil, the City and Guilds of London Institute, the Royal Commissioners for the Exhibition of 1851, the Royal Society, the Professorial Staff of the Imperial College, and the learned societies concerned with ministrative officer of the L.C., for the

time being, is also a member. Imperial College of Tropical Agriculture, incorporated in 1921 as the outcome of recommendations made in their report by a committee appointed by Lord Milner in 1919 (see Cind. 562). The object of the college is to promote the study of tropical agriculture in suitable surroundings, and to creat a body of Brit, expert agricultunsts well versed in the knowledge of the cultivation of land in the tropics, of chamsts, and of scientine advisors posses-sur an intimate knowledge of the means of combating pests and diseases and to conduct research. The college buildings are at St. Augustine, near St. Joseph. Trindad. The finds are derived from contributions from colonies and industries participating in the movement and an inverted grant. The Imperial Dept. of Agriculture founded in 1898 was amaiganated with the college in 1922. Post. graduate courses are open to holders of a degree or diploma of any Brit. univ. or other academic in-titution approved by the governing body of the college. Retresher courses are open to officers of ague, depts, in the tropies, or similar in-stitutions. There is also a three-year diploma course pensarily intended to give instruction in W. Indian agriculture, besides a two-year course in sugar technology.

Imperial Communications Advisory

the recommendation of the Imperial Wire-less and Cable Conference, 1928, to act in an advisory capacity in regard to tele-graphic communications. The formation of the Committee may be regarded as the corollary to the merger of cable and wireless interests which took place in 1928. is composed of eight members representing the Home and Dominion Gover, Colonies and Protectorates, and it is charged with cortain responsibilities relating to the activities of Imperial and International Communications Limited—the public utility company which was formed in accordance with the recommendations of the Conference previously mentioned, for the purpose of co-ordinating the telegraphic services (cable and wireless) connecting the various parts of the Brit. Empire. The Committee is concerned with questions of policy regarding, in particular, the in-titution of new services, the discontin-uance of existing services, and the dis-tribution of traffic between alternative tribution of traine netween atternative routes. In 1944, on the nationalisation of the Cable and Wireless Company, the L.C.A.C. became the Commonwealth Communications Council, its former duties being somewhat extended owing to the nationalisation of the Company. The nationalisation of the Company. The Council will probably disappear in its turn, to be replaced by the Telecom-nunications Board.

Imperial Conference, constituted by resolution of the Colonial Conference of 1907 to the effect that such a conference should be held every four years for the discussion of questions of common interest as between the Brit. gov. and the govs. of the self-governing Dominions beyond the cas. The Prime Minister of the United Kingdom acts as ex-office president, and the Prime Ministers of the Dominions are ex-officio members; the Secretary of State for Commonwealth Relations (formerly Socretary of State for Dominion Affairs) is also an ex-officio member and deputy president; and, in addition, such other ministers as the respective gove may appoint may also be members. Except by special permission of the conferences, each discussion is conducted by not more than two representatives from each gov., and each gov. has only from each gov., and each gov. has only one vote. A resolution was passed in 1917 to allow of India being fully represented. The Irish Free state dator Eiro) was instrepresented at the I. C. of 1923. There is a permanent severational staff under the Secretary of State for Commonwealth Relations, appointed to keep the sev. govs, informed during the periods between the conferences in regard to matters which may come up for discussion. The I. C. grew out of the Colonial Conferences, of which there were four prior to that of 1907—three in London and one in Ottawa. At the first, held in 1887, the most prominent question was the organi-ation of Colonial defence, and an important agreement was arrived at for

tions between the colonies (they were not then styled 'dominions') and between the colonies and the mother country was considered at the Colonial Conference held at Ottawa in 1894. At that conference the decision was taken to lay a cable between Canada and Australia, work on which was begun in 1902. At the conference of 1897 Imperial preference was the chief question, and Imperial defence also received much attention, Cape Colony contributing money for a first-class battleship. In 1902, the year of King Edward VII.'s coronation, advantage was taken of the presence in London of Colonial Premiers to discuss the political and commercial relations of the Empire and its naval and relations of the Empire and its navai and military defence. Then came the Colonial Conference of 1907 (which passed the resolution mentioned at the opening of this article), in which the Frime Ministers of all the self-governing colonies took part, including the Transt and, where the first elections under responsible gov. had just taken place. taken place. At this conference all the members except the gov. of the United Kingdom re-affirmed the resolutions of the 1902 conference on preferential trade within the Empire; but the gov. of the United Kingdom was unable to admit either the necessity or the expediency of altering the fiscal system of the United Kingdom. In 1909 a Defence Conference was held in consequence of part, discussions on the naval position, and as a result of the Conference various dominions placed orders for cruisers or made imaneral contributions.

The first conference which was officially styled 'Imperial' was held in May June, 1911, the chief questions considered being the constitution of the conference, interimperial consultation regarding Treaties, mornition, naturalisation, the treatment of Indeas in the Dominions, cable B. n communications, and uniform treatment of But, shipping. Arising out of this con-ference a Royal Commission was appointed to report on the natural resources and trade of the Empire, and the work of this Compassion has undoubtedly acted as a stimulus in this direction ever since (see also LAPERE, MARKETING BOSTO; IM-PERIO ISSUIUTE: IMPERIAL ECONOMIC COMMITTED. During the First World War the normal L. C. was postponed and over-as representatives were temporarily made members of the War Cablinet (see Cv. 1812, J. MPLRIAL, W.R., At the Impered War Conference of 1918, apart from confidential deliberations on the prosecution of the war, the most important resolutions dealt with the future economic policy of the Empire respecting raw materials. At the close of hostilities in 1918 representatives of all the self-governing dominion, were unmediately summoned to take part in the discussions in London over the peace negotiations, and also in the work of the Peace Conference in Paris. There was also a Conference of Prime Ministers important agreement was arrived at for the authorities and representatives of the United Kingequadron. Other questions discussed were domained and the dominions and India held in mail services, Imperial penny post, and London in 1921 under Mr. Lloyd George. The Conference considered in detail the The question of trade and communicaforeign policy of the Empire with special

reference to the League of Nations, which | and supply of munitions and raw materials had not then been formed, and say | as well as of food and feeding stuffs | De meetings were devoted to discussing the naval, military, and an defence of the Empire The I C of 1923 reached a common understanding on the main beeds of foreign policy, subject (as always in the case of resolutions by an I C) to ratification by their acv gove. In that year an importal Economic Conference was held to consider in detail the economic relation; consider in detail the economic relation; not without interest to note that, on the between the sev parts of the Impare and all aspects of imperial trade, including imperial preference (q|r|) overseas settle unit (q|r|), co-operation in financial assistance to imperial development, the Imperial Institute (p|r|), and the establoof is all including the imperial I conomic Committee (q|r|) and including the imperial I conomic Committee (q|r|) and including the imperial I conomic Committee (q|r|) and including the imperial Relations affecting inter Imperial Relations affecting inter Imperial Relations which were referred to a committee (q|r|) and other member of the conomic without interest to note that, on the first section without interest to not that, on the first section without interest to note that, on the first section without interest to note that, on the first section without interest to note that, on the first section without interest to note that, on the first section without interest to note that, on the first section without interest to note that, on the court interest to note that, on the first section without interest to note that, on the court interest to note that, on the first geometric forms without interest to note that, on the court interest to note that, on the first geometric forms without interest to note that, on the first geometric forms without interest to note that, on the first geometric forms without interest to note that, on the first geometric forms without any other and the first geometric forms without interest to note that, on the first geometric forms without any other and the first geometric forms without interest to not without interest to not the first geometric forms without interest to not the first geometric forms without interest to not the first geometric forms without any other and the first geometric forms without interest to not the first geometric forms without interest to not the first geometric forms of the first geometric forms of the first geometric f tions, which were referred to a committee tions which were referred to a committee of Prime Ministers and he did so fields; the presided over by I and I alfour (see Instruments of the content of the period of dominion legislation and merchant stapping was held in the operation of dominion legislation and merchant stapping was held in the obscussly lacks the effectiveness which the other prime in the subject of merchant stapping with the constitution through high commissioners again the subject of merchant and continued to the constitution of the committee of the committee. relations figured prominently in the 1 c. Institute of Entomology, Imperial Imperial Institute of Entomology founds in 1+13 to encourage and co ordinate entomological work throughout the I implie in relation both to hum in and animal discuses and to agriculture. It was known as the Imperial Bureau of Into mology until 1930 I he head office is at the Brit Museum (Natural Hist) Crom well Road London, 9 W. The Institute absorbed the Entomologial Research Committee appointed in 1909 with the ob-Committee appointed in 1909 with the object of furthering the study of economic entomology particularly in the Brit Fropical African Colonies and Protectorates. The Institute publishes a quarterly bulletin entitled The Bulletin of Fulumological Research and a mouthly review entitled The Review of Applied Entomology which summarises all current entomological literature bearing on in instance therets. jurious insects

Imperialism. In a general sense I means merely a system of gov. under an

emperor But the term I, as used in England prior to the I just World War had a narrower but much more pregnant sense, as incading the policy of those who aimed at a closer knitting together of the countries forming the Brit empire 1o latter day imputables 'the spirit of on pire's sounds an inspiring note and con ures up dreams of an A S federation or confract rulty of states the like of which for solidarity material and moral progress the world has never some But in its be ginnings I had no such heroic foundation It was an antidote to the doctrines of the Munchester School and a movement frankly mitrated in the intersets of national safety only. The secosion of the N American colonies from allegrance to the Englishment taught the lesson that the great colonics or dominions with re-presentative institutions are worths of consideration on an equal footing with the mother country and their equal status with that of the mother country is now a political commonplied. But another its political commonplace son it taught was of more immediate im portance it seemed to many that the grant or acquisition of self gov was but a step in the direct final emancipation, and that it must me vitably follow that one great colony or dominion after another would eventually be lopped away from would eventually be lopped away from
the trunk of the empire and in fact this
has already happened in the case of India
and har. Of a gritintously artificial
nature, to wis the furner commertal
policy between the mother country and
the colonies. It was hoped to keep the
colonies intuit by restricting the importation and exportation of colonial
goods to Brit ships manned for the mest
part by Brit scamen and this policy
enacted by the Navigation Act of 1660
was continued up to the time of the
repeal of the Coin Laws in 1846 and the
laying of the corner stone of Free I rade
in 1849 by the repeal of the Navigation
Act. That this stunting of colonial trade
hampered the material progress of the
empire was amply demonstrated by Adam
Smith and other economists. That it compare was amply demonstrates. That a policy of free trade with its consequent expansion of colonial power would accelerate the final disnomberment of the second no less robable. The empire seemed no les probable. The optimism of the Manchester School there forc, expressed itself in the puridox that the empire was really in a better position without colonies the were no longer com-pelled to open their ursts (Nusvels to the mother country and that it was un nocessary to retain them at all there follows lowed after the middle of the nineteenth lowed after the middle of the nineteenth century a period of more or less complete mutual indifference. The colonics fostered their manufa with the help of tariffs directed largely a_lant Brit good while Great Britain consistently ignored colonic tiado

The continuance of such a policy might well have been indefinite but for the sud den and lively perception of danger to the whole fablic of the empire from a hitherto unlooked-for source. The astonishing rise and progress before the First World War of the Ger empire, and its steady

policy of naval and military aggrandies—ment, awoke Brit statesmen to the real-lation of the comparative ease with which a state of not much inferior fighting stringth could, by shutting out food supplies cripple the Brit empire. The direct out one of this realisation was the Imperials movement, which found concrete expression in the Imperial Federation Lagus (founded in 1881) and the inaugus thom of colonial conferences (later style I Imperial (out rences (q v)). Flist movement received a fresh impetus from movem at received a fresh impetus from the vigorous administration of the colonial off e under Joseph Chamberlain, with whose name and that of escal Rhodes the purt of I in later years became primarily is served. Chamberlain inheriting the lift in of Beaconstield that colonial constitutions for from being steps towards disintegration formed part of a great pol-tey of Imperial consolidation, encouraged the cordial relations with the colonies by organising further conferences and inore the later conference by the almost simut theous rush of the Powers for pro-titrates and 'spheres of influence' in Min' In this rice for tr' (edl Rhodes) in > Africa, and Sir George Goldie (q':) in Wafrica augmented the Brit cupiro within the space of twenty years by a tid are exceeding that of the whole of I'm >> But even late in Rhodes's career hething was lacking in the direction of with this as well as other growing limbs f the empire Rhodes indeed on one usion threatened to seed altogether the norther country altered her in a towards S. Africa. It is here that the work of the Imperial Federation. I ague (a body which since the enhanced stats of the dominions overs as necessarily ceased to exist) did so not higher the head of the country of the state of the state of the dominions overs as necessarily ceased to exist) did so not higher the state of the s frits aim was to replace del nience by i im ition to lead up to a united empire or litition a union difficial from a mere chiony on the on law and on the chion an ant latt I like that of Casars of Napilcial bonaparte

these ideas, and a series of protected the outcome of a proposal adopted by the nationalities arose. Eventually, the two principles, nationality and L., though strikingly analogous, are arrayed against the encouragement and co-ordination of each other. Britain conquers; but by the two throughout the Empire on the testimony of men of all races who have found refuge within her confines, she conours lees for hereaf than for humanity. It is this, the modern I. which has insensibly but surely taken the place of the anct. or narrower patriotism of England,

The Brit. Empire has certainly shewn

great stability in tunultuous times. Eve empires were involved in the First World War, and only the Brit, empiresurvived it. After that war the Brit. Empire adapted After that war the Drit. Empire stapped itself to the post-war age by a process of discussion and agreement and law-making, and by enlarging instead of destroving old freedoms. This is peculiarly exemplified in the development of dominion status (q.v.) through successive imperial con-

ferences

Left-Wing extremists, who dislike the Empire in the form in which some 'imperialists' represent it regard it as merely the instrument of 'economic imperialism' and all Brit. professions of 'trustecship' for the backward races as hypocrisy. They used to aver for example that vested interests were the sole obstacle to the prompt concession of absolute independence to India. But extremism is never likely to be a formidable danger, and the risk, such as it is, 'lies rather in indifference or misunderstanding among men of goodwill as to the meaning of the empire and the value of maintain-ing it. For many such the cause that fills their hearts in this post-war ern is the cause of international friendship and cooperation; and they feel that "imperial-

operation; and they reef that "imperations," however transmitted is somethow out of tune with "internationalism"."

The fact too that the Brit. flug flee over so great a part of the backward regions of the world is bound to excite the calousy and cupidity of other nations. The reply to these questioning is that the Brit. Empire serves not only the the Brit. Empire serves not only the interests of its own members, but also those of the world as a whole. As the world is at present constituted, no international order can achieve its purpose without sacrifice of national self-determination greater than the trued-out collection. ministion greater than the CR-q-out collec-tive system ventured to demand. In the meantime, 'It would be a fatal blunder to dissolve the international unity of our lesser league within the League' (R. Coup-land). The course of events in the Second World War confirms the case made for the Brit, Empire by both Professor Cramb and

the encouragement and co-ordination of work throughout the Empire on the diseases of plants caused by fungi. Since 1933 the Institute has been under the control of the executive council of the Imperial Agricultural Bureaux. Its work on the diseases of plants caused by fungi is broadly on the same lines as that of the Imperial Institute of Entomology (q.v.) in regard to insects. Its primary function is to assist economic inveologists in the over seas Empire by the accumulation and distribution of information on all matters connected with plant diseases and by the identification of specimens.

Imperial Preference is the title given to that policy by which the sev. members within the Brit. Commonwealth of nations within the Bril. Commonwealth of nations would impose tariffs to the disadvantage of those countries without the Commonwealth and to their own mutual advantage. The Corn Laws (q.r.) had produced an ardent hody of free truders led by Richard Cobden and John Bright, and their efforts led to the repeal of the Corn Laws in 1848. From that thee until 1932 Britain was a free-trade country—apart from the lovying of the McKenna dutes (q.r.) and the tariffs imposed on certain key industries. With the spread of imperialism in the eighties of last contary imperialism in the eighties of last contury came the spread of this idea of I. P., and in the early years of the twentieth century Joseph Chamberlain led a great but un-successful movement for the conversion of his countrymen to the policy of protection, nis country men to the policy of protection, with preference to the various members of the Brit. Empire. This policy was also advocated by Bonar Law both before and during his premiership. The movement was carried on by Lord Beaverbrook (q.c.), who founded and fectoral in 1920. As Exp. who founded and fostered in 1930 au Empire Crusaders Party with the avowed object of making Empire Preference a reality.

Under the Import Duties Act, 1932, a ten per cont ad ralorem duty was imposed on a wide range of imports, but free entry was given to all Dominion imports, and this freedom of entry was continued under the reciprocal trade agreements made after the Ottawa Conference (q.r.), of July, 1932. These agreements, which have been considerably modified provide for a tariff on a number of foreign primary pro-ducts for the benefit of similar Dominion products, and reciprocal tariffs against products, and reciprocal turing against foreign manufacturers for the benefit of the U.K. manufactured goods in the mrkts, of the dominions. Preferences are also granted to Brit. colonial goods, and also by many colonies to U.K. goods.

Brit. Empire by both Profess of Cramb and Professor Coupland and by many others. See J. A. Cramb, The Origins and Destiny of Imperial Britain, 1915; Sir C. P. Lucas, The British Empire, 1950-1930, 1931; Sir C. P. Lucas, A Short Instary of the Fromsion of the British Empire, 1500-1930, 1931; Brit. Coupland, The Empire in these days, 1835; R. Coupland, The Empire in these days, 1935; R. Muir, The British Empire; How at Grew and How it Works, 1940.

Imperial Bureau of Mycology. It was the qualification for the order. King

Edward VII founded the order in 1902, when the number was limited to 425.

was enlarged in 1912.

Imperial Tobacco Company (of Great Britain and Ireland), Limited, was formed in 1901, when some of the leading Brit. tobacco manufacturers joined forces to resist an attempt by a powerful associaresist an attempt by a powerful association of Amer. manufacturers to capture the Brit, tobacco mrkt. The original firms joining the I. T. C. retained their identity and became branches of the Company. The following is a list of the company's branches today: W. D. & H. O. Wills; John Player & Sons; Ogden; W. A. & A. C. Churchman; Stephen Mitchell & Son; W. & F. Faulkner; Lambert & Butler; Edwards, Ringer & Bigg; Franklyn, Davey & Co.; W. T. Davies & Sons; and Win, Clarke & Son.

The Company manufactures cigarettes.

The Company manufactures eigarettes, pipe tobacco, eigars and snufts for sale in The exthe United Kingdom and Eire. port business was sold to the British-American Tobacco Company, Limited, in

Imports and Exports. Theoretically the exports of a country exchange for im-Theoretically, ports at such values that the former will pay for the latter, and it is probably true that exports and imports constantly tend to an equality. But it was long uncertain whether it was more advantageous to have a surplus aggregate value of imports over exports, or nec rersa. According to John Stuart Mill this uncertainty arose prim-arily from the traditional habit of looking rather to the profits of merchants than the price of commodities to the const. habit which, in its turn, rested on the longdiscrided belief that money alone was wealth. At the time of Mill it had become generally settled that the profit of foreign trade consisted in the difference between the price at which the goods were bought and carried, and the price at which they were sold. The difference between the gross money-value of the exports and unports of a country will give a rough idea of the amount of this profit. In England in 1863, 1864, and 1865, for example, the ratio of imports to exports was about 5 to t. This fact would have excited alarm before Adam Smith's time. The assumption would have been that England was issued. Imperial War Museum, opened at the to Mill, and to Professor Ashley, and Crystal Palace in 1920, removed to the others of the 'Free Trade' school of Imperial Institute, S. Kensington in 1921, thought ('free imports' would more acand to Lambeth Road, London, S.E. ii envisely express the doctrine), the only direct advantage accruing to a country from foreign trade consists in the imports; because, after paying with exports for the things it cannot itself produce, except at a greater expense of capital and labour than the cost of the exports, there is ar hypothese a surplus of labour and capital for the production of oth r thugs. Mill exthat the opposite theories assume that whit a country pure with, and not what it obtains, constitutes its gain; and adthat the benefit of fareign trade was that it afforded an outlet for surplus produce and enabled a portion of the capital of the oxporting country to replace itself with a prout. His criticism may be summarised profit. an exportable article in excess of its own wants from no inherent necessity, but as wants from no innerent necessity, but as the cheapest mode of supplying itself with other things. The inference drawn from this theory is that the only alter-native to experting in excess of wants would be the employment of the capital and labour thus set free in producing things previously imported, with a corresponding loss to consumers by reason of

process of interchange of commodities is not necessarily as simple as the statement of its fundamental principle. There is of its fundamental principle. the element of the cost of carriage, and it by no means follows that any particular imports can be allocated as the price of any particular exports, since any one given country trades with so many other countries. Moreover, exchange values are continually fluctuating within the limits of the ratios of the costs of produc-

higher prices. And this strife between papers and not according to average the capitalist, or producer, and the consumer is to be observed in all the fiscal duced by the importers and exporters, arguments of recent times. Of course, the tions) exported from the U.S.A. to Great Britain to-day are grain and flour, raw cotton and cotton waste, fish (especially salmon and lobsters), tobacco, bacon, bum, lard, from and steel, hides and skins, reined sugar, fresh fruit and vegetables, raising, and leather manufactures.

Below is the import and export table of U.S.A. for the years 1925, 1929, 1937-1947, while the prin. articles exported by the Brit. Isles to the U.S.A. consisted of tion in each country although they tend from and steel, cotton, linen and woollen

to an ultimate equality in accordance with plece goods. Mill's law of the equation of international demand.

The most important items of Brit. imports are foodstuffs and raw materials, while about six-sevenths of the total exports are articles wholly or mainly manufactured. After the 1914-18 war, and as a consequence of it, there were extra imports in various countries due to payment of indemnities, and Germany, the prin-loser, was forced to export and thus the Allies to import; while repayment of inter-allied debts was a contributory fac-tor to further theoretical importing and exporting. The value of goods imported exporting. The value of goods imported is usually that at the port and time of entry, including cost, insurance, and freight (known familiarly as C.L.F.). Foods despatched for sale have their mrkt.-value recorded in the returns at the time of leaving this country, the value being based upon a declaration of the exporter. This is checked in the customs dept. Export goods are valued at the port of shipmont, while imported goods are valued at the country from which they were consigned, which is not always the place of shipment.

For the years 1913, 1938-40, and 1943-47 the values of imports and exports of merchandise relating to the United King-

dom were as shown above.
In the U.S.A. the values of imports and exports are fixed by invoices or shipping

commission of a criminal offence and orders the documents in the case to be retained and sent to the director of public prosecutions, he is said to I. the documents.

Impressionism, in art, the somewhat vague and indiscriminate name given to a certain type of modern painting which is most strongly represented by the Fr. schools of Edouard Manet on the one hand and Claude Monet on the other. and Claime Monet on the other. The former is purely realistic in its ideals; the latter, for which the name 'luminism,' or, as Camillo Mauclair suggests, 'chroma-tism,' would be more correct, alms at the study of atmospheric effects, the play of light, and similar chromatic values. The term 1. arose through the exhibition of Monet's 'Impressions,' a sunset which aroused particular ridicule at the Salon des Refuses (1863), and four years later a phrase in the catalogue of the exhibition parase in the catalogue of the exhibition of Manet's work estab. it still more firmly. Some, however, think that the term impressionists was first used in 1874 when the first 'impressionist exhibition was held, in Paris, by which time the various tendential the manufacture of the statement of t denctes in the works of the protagonists of I. were, at the moment, fixed into a doc-trine common to most of the group. That doctrine may be said to have received its impulse from Courbet, who revealed a new breadth of handling and an interest in contemporary subjects. His exhibition in 1855 stirred up something little short of panic in the ranks of official Fr. art, since it forced them to realise that all the problems of art were not confined to the familiar struggle of Ingres versus Delacroix, or drawing versus colour, but that a third and more alarming doctrine had arisen: that of Realism. To younger artists like Pissarro, however, Courbet's return to nature and his rejection of conventional subjects opened up exciting new possibilities; and other painters who were deeply influenced by Courbet at this time were Manet, Fantin-Latour and Whistler, though the two latter were afterwards to deny their early nesster It was, however, Whistler who introduced the word into Eug. art-vocabulary by his ex-inlation at the Grosvenor Galleries (1878). Since those days, in the teeth of opposition which is unparalleled in the hist, of art which is unparalleled in the hist of art—except perhaps in the somewhat analogous case of Wagner's music-dramas—the movement has spread over the whole of birrope. The Fr. element is discussed helow in some detail: it will be sufficient to mention the chief foreign representatives: (Ger.) Max Liebermann and kinchl; (Belgian) Van Rysselberghe, Verhevdon, and Heymans; (Swiss) Felix Vallotton; (Dutch) Matthys Marys; (It.) Pietro Fraglacoma, Boldini, Segantini, and Michetti; (Sp.) Zulosga, Francisco Pradilla y Bastida, and Rusinoj; (Dan.) Viggo Johansen and Kroyer; (Swedish) Auders Zorn; (Norwerlan) Fritz Thaulow; (Russian) liya Repin. In Britain, apart (Russian) flya Repin. In Britain, apart from Turner and Constable, the movement is chiefly represented by the Glasgow school, John Lewis Brown, Guthrie, and Lavery; whilst Whistler, Sargent, Harrison, and Mary Cassatt are its

but technically it was no less a revolt against Romanticism also. In technique Watteau, Monticelli, and Delacroix are the chief forcrunners of I as fat as the div of Lorrain Vernet, tones is concerned, Lorrain Vernet, Ruysdael, and Poussin are its progenitors in the matter of landscape treatment and composition the movement was also very strongly influenced by the exhibition

The sources from which I. was evolved the Luxembourg), Renoir, Desboutins, are of the widest. It was in spirit akin to Bazillo, Legros, and Whistler (at that time the Romantic Movement, as a revolt a student). They also found sympathetic against the classical or academic schools, support in Gautit, Baudi life, the form support in Gautier, Bandel die, the Gon courts, Zola, Mallarmé, and other men of letters, at different periods—It is there fore justifiable to regard Manet as the first great painter to lead the revolt of modern art agrinst the as mbolists and Romantics In the realist impressionists as the chief of whom we may name Vanet Courbet Bastin Lepage, and Degas, we find the artistic cuterion of fruth of character – of Jap paintings of Hokusai, Out imato, lecrete crate-substituted for that of be nuts

MONICH IA GARL ST LAZARF'.

and Hiroshige at the International Exposition in 1867, both as regards its realism (e.g. Manet) and 'luminism' (e.g. Monet) But it might be claimed with no small de gree of truth that I. was chiefly of hing. origin, although it has made its head-quarters in France. According to Wyn ford Dewhurst, 90 per cent of the theory of I was clearly embodied in Ruskin's Fle ments of Drawing And it was from Furner and Constable that Monet, Pissarro, and the others took their chief inspiration, especially in the matter of landscape treatment -the ideal style of subject for impressionist treatment, and the one in which the greatest results have been achieved In the first place I, centred on Manet,

who was virtually the president of a little club that used to meet at the Café Guerbois, in the Quartier Battgnolles, the circle included Monet, Pissarro, Cézanne, Degas, Jongkind, Berthe Morisot, Fantin Latour (whose life-sized painting of a

But this was only one of the ideals of the now att there were two others, respectively the study of the myster; and beauty of light and the study of am pression is the catching and reproduct tion of a nomentary vivid glimpse of a scene, as si posed to the systematic reproduction of the details which are unseen in such glimpses. The impressionists were the first to learn the art of presenting a tout ensemble wherein details were either deleted or subordinated to the summarised effect of the whole A blurred vision of effect of the whole. A blurred vision of things which eneircle a central object on which the gaze is founded as once to othe ally. To a realist painter it is also correct artistically. And not only the focal prin-ciple, but brilliant similght, mist, or per-spective are capable of blurring the de finition of objects. Of the lumnists, i.e. those whose main concern was the study of the mystery and beauty of light, as men tioned above, Monet was the loader, they group of the prin. members now hangs in may be considered as the direct descripdants of Delacroix. Of the other school, Renoir and Degas may be taken as most typical. With Monet and his group, the whole technique of I. is thoroughly investigated for the first time; they estracised the conventional tonality of brown, and the use of all browns, blacks, and ochres; by the majority all palette mixtures were abandoned and only the pure colours of the spectrum, in addition to white, were accepted.

Side by side with the juxtaposition of touches of pure colour are the principles of: (1) The simplification of light and shade in the presentation of mass rather than outline: (2) the investigation of shadow, which is not absence of light, but light of diminished intensity; and (3) the separation of local colour and reaction. By the employment of these means the impressionists succeed in a marvellous degree in the portrayal of motion-the sway of shadow, the passage of light, the heaving movement of water, the sensation of wind. However much of this may be crodited to such painters as Géricault and Fromentin, the combined value of light and of movement in relation to one unother reaches its supreme expression on the canvases of M. (Renoir, Degas, Cézanne, Pissairo, and Sisley). With it we canvases of a Cocanne, Pissarro, and sisley. With it we must also associate the visionaries, or his cocanne for his symbolism. Puvis de Chavannes for his fine decorative freatment, and Currière for psychic insight. The last named, like Whistler, Harrison, and Pointillin, belongs to a distinct school, whose technique dif-fered from that of Monet in so far as, instead of employing the principle of juxtaposition of pure colour, they applied flat tints in a broad style, using not only the pure, radiant prematic colours, but also palette mixtures. It remains only to refer to the method known as 'Pointillism,' whereby the colour is transferred to the canvas in spots instead of m mass, as in the case of the chromatists already discussed. The inception of this method, which is associated rather with the Neo 1, of which Gaugum, Deals, and Van Hysselberghe are the leaders, is attributed to M. Henry, who conceived the aesthetic expression of the newly discovered scientific theories on colour-waves and spectral analysis in the works of Helmholtz and Chevreul about 1880. The idea concerned itself especially with complementary colours and the reaction of tones. Its chief practical application is ascribed to Georges Seurat. an Gogh also used this technique, and Van Rysselberghe employs it constantly But the method is obviously alien to the spirit of art: it is charmless, devoid of character, too purely theoretical and removed from inspiration.

The tirst success of 1. was the exhibition of Manet in 1884, consisting of some forty of Manet in 1603, tand ten years after the first public sale, when such frantic hostility was shown that it was necessary to organise police precentions! In 1897 organise police precantions! In 1897 the collection of Calilebotte, a wealthy amateur who had befriended I. from the outset and had even gained some small notorioty for his own work, was accepted

with reluctance and after considerable hesitation by the Ministry of Fine Arts and exhibited in the Luxembourg. The same year at the Vever sale, and two years later at the Choquet sale, the once despised canvases changed hands for enormous sums. Manet's portrait of Monet in his studio, for instance, which realised about 150 francs in 1884, went for 10,000 francs, while at the Pellerin, Paris, in 1910, even greater prices were offered. See C. Mauchir. French Impressionists, 1904; Maliciair. French Impressionism, 1904; W. Dewhurst, Impressionist Painting, 1904, with bibliography; C. Marriot, Modern Morements in Painting, 1920; F. Rutter, Evolution in Modern Art, 1926; W. Uhde, Die Impressionisten, 1937; J. Rewald, The History of Impressionism, 1947.

Impressionism in Music.—Term applied sures on loss lossely to composer (especi-

more or less loosely, to composers (especially Fr.) contemporary with the school of impressionist painters. Debussy, although he disapproved, was designated as the leader of musical I. One of the chief aims of I. is to interpret artistically a momentary glimpse of things rather than their permanent state.

Impressment, act of forcibly taking persons or goods for the public service; but generally restricted to the work of press-gangs in compelling persons to serve as soldiers or sailors in time of war. I. of salors differed from that of soldiers, It was regarded as a prerogative right of the crown, given by the common law and recognised by statute. This is espiamed by constitutional historians by the fact that the feudal tenure of land made provision for land but not for sea service. 1. of soldiers was declared illegal by the Long Parliament of 1641, but was occasionally resorted to subsequently, c.g. during the Amer. War of Inco pendence, under special parl, authority. 1. of soldiers is to be distinguished to a conscription, which, although also a statement, applies to all ablebodied persons alike. It may be observed here that during the Boer war of 1909 the f. of goods was commonly known by the term 'communication'. commandeering.

Imprisonment, see under PRISONS, Impropriation, the grant of a benefice or parsonage to a layman cr lay corpora-tion as opposed to 'appropriation,' or the annexing of a benchee to the proper and perpetual use of some religious body politic. The terms have, however, been used synonymously both in text books and in statutes. Both terms imply the endowment of vicarages consequent on the rise of par, churches by the consent of the bishop, who alone had the care of souls in his diocese, together with the title to all cecles, revenues. But as the practices of appropriation and i. originally prevailed, there was an essential difference; for a layman, not having care of souls, applied the temporalities of the benefice to his own uso. Before the Reformation appropration and f. prevailed extensively, the monasteries furnishing the most numer-ous examples of the religious corporations that obtained grants of benefices. After the suppression of monasteries the crown was vested with all such rights as related

to the grant of benefices; but the crown from the pope, from bishops for their freely transferred its rights to laymen, diocese, or higher superiors of religious In practice the spiritual duties of rectories, orders for their subjects may or can absolve the tithes or whole property of which have descended to laymen, are always discharged by a vicar (Lat. vicarius, delegated), who receives a certain portion of the enoluments of the living (see GLEBE LAND). See Phillimore's Ecclesiastical LAND). See Phillimore's E. Law: Blackstone's Comments.

Improvisatori, or Improvisation, the art of composing verses, whether accompanied by music or not, on the spot without preparation, and on subjects suddenly proposed. It is distinctly It. in origin, though the Provencel troubadours, in spite of the claborate versification of their poems, are credited with the power. Silvio Antonio (1540-1603) was said to have been made a cardinal because of his skill in composing verses on any subject; Perfetti (1681-1717), to the accompaniment of a guitar, astonished the whole of Italy by his skill. He was crowned with laurel by Pope Benedict XIII. Corilla Olimpica, Madame de Stael's Corinno, was also crowned. Outside Italy, the Swedish poet, K. M. Bellman (1740-95), the Fr. Joseph Méry (1798-1865), and the Eng. humorist, Theodore Hook (1788-1811) may be mentioned. The art is practised to-day which it is practised to-day. tioned. The art is practised to-day chiefly in music-hall and cabaret enter-tainments. Many of the great musiclans and instrumentalists have exhibited their power of improvisation. See A. Vitagliano, Storia della poesia estemporeanes nelle lettere italiane, 1905; E. Ferand, Die Improvisation in der Musik, 1938.

Imputation, attribution to another of some quality or character, especially of a charge of guilt. The term is used technically in theology of the attribution to all faithful believers in Christ of His stablements and the characters are characters. rightcousness, by Mearions substitution of man's sin to Him, and of Adam's sin and its consequences to all mankind as Adam's descendants. The term thus plays a part in the doctrines of original sin, of predestination, and especially of the orthodox view of the Atonement (q.v.).

Imros, see IMBROS.

Ina, or Ine, king of the W. Saxons, or Wessex, succeeded Ceadwalla in 688. He forced compensation for the death of Ceadwalla's brother from Kent in 691, conquered Geraint of W. Wales in 710, fought in Wiltshire against the Mercians, and in 725 crushed a revolt of the S. Saxons. He drew up a still extant code of laws for Wessex, and having abdirated in 726, and retired to Rome where he died, the date not being known. He is said to have built Glastonbury.

Inaccessible Islands, see TRI-TAN DA

CUNHA.

Inagua, Great and Little, two is. in the magus, creat and Lattie, two is, in the archipelago of the Bahamas in the Brit. W. Indies, situated at the southern end of the group. Great Inagua has an area of 530 sq. m. and contains salt ponds. Pop. under 2000.

Inari, Lake, see ENARE.
In Articulo Mortis (literally, at the point of death). In the Rom. Catholic Church

penitents from their sins. But a simple priest, even if degraded or apostate, can absolve any penitent in articulo vel periculo mortis in all cases, including those of grievous sins which are ordinarily reserved for absolution by some eccles, superior, like the ordinary of a diocese. As to the As to the admissibility in evidence of the declaration of a deceased person relative to the cause of his death, see under DECLARATIONS OF DECEASED PERSONS.

Inca, tn. in the Balcaric Islands in the Mediterranean, 17 m. E.N.E. of Palma, Majorca, belonging to Spain. Oil, whee, and almonds are its chief products, and algives its name to one of the five judicial dists, into which the is, are divided for the purpose of administration. Pop. 9400.

Incandescence, the term applied to the state of bodies when they give out light through being highly heated and yet are not undergoing chemical change. It is usually associated with solids, although the oxy-hydrogen flame is an example of its appearance in gases. See Gas and

ELECTRIC LAMPS.

Incandescent Light is produced when a 'mantle,' consisting of a conical hollow gauze of certain metallic oxides, is placed in a hot but non-luminous flame produced by a burner of the Bunsen type. bach was the first to substitute certain metallic oxides for carbon as the incandes-cent body. The 'mantle' is made by impregnating a cotton or ramic' stocking' with a solution of various salts, the usual mixture being 99 parts thorium nitrate and I part cerium nitrate. On ignition a skeleton of the oxides of the metals remains, giving out a brilliant light by virtue of its incandescence.

Incandescent Lighting, see under Electric Lamb and Electric Lighting.

Incantation (Lat. incuntatio, from incantare, to enchant; from in , cantare, to sing repeatedly), the use of a set form of words, spoken or sung, to produce a magical and preternatural effect. The use of the word incanture in Lat. is very early, for it appears in a passage quoted by Pliny from the Twelve Tables, and from it is derived, through the Fr., our word 'enchant.' It is almost certain that the use of magic spells must be traced to an Akkadam source, for many anct. ex-amples of Babylonian and Assyrian formule have been discovered. An interesting sidelight on the important position which the Magi or magicians, generally Chaldeans, held at an E. court, is given in the Book of Paniel. Ultimately we are told that Paniel binself became their head. An almost unbounded power was attributed in anct. times to the power of magic rimes, to which the gods and the powers of nature were believed to be subject. Many of these could be used by any individual, but others were the prop-erty of the priest or magician, whose influin Articulo Mortis (literally, at the point ence was due to his supposed power for of death). In the Rom. Catholic Church good or evil. In Christian times, the use only priests who have received jurisdiction of Is. has by no means ceased, even in the

countries commonly named Christian. It is the spiritual courts took cognisance of can easily be traced through the centuries. In the Middle Ages the sucred coremonies and rites of the Church were often con-ceived of by the ignorant as charms. An allusion to the use of the first fourteen verses of St. John's Gospel as a kind of incantation is given in Chancer's Prologue in the lines on the Friar beginning plesaunte was his In Principio' Many of the old nursery rhymes now dying out were formerly used as incantations against rain and the powers of nature Lenormant, Chaldean Magic (trans., 1878); L. F. Maury, La Magic et l'Astrologic (1th ed.), 1877; Sir J. G. Frazer, The Golden Bough, 1900.

Incarnation (from Lat. incarnari, to be made flesh; from in + care, flesh), in Christian theology, the act by which the Second Person of the Blessed Trinity assumed human form and human nature. In many other religions, and especially in those of India, there are accounts of the taking of human flesh by the gods in order to seenre a fuller revelation to the world; but these differ essentially from the orthoox Christian belief in the L. of Jesus Christ, which lays stress on the fact that the Logos, eterman divine, then became also essentially human, so that Christ was perfect God and perfect Man; one not by conversion of the Godhead into desh, and the layer the membered into God. by conversion of the Godfield into flosh, but by taking of the manhood into God.' See R. Wilberforce, Doctrine of the Invariation, 1882; J. Orr, Christian View of God and the World, 1893; J. Gore, Bampton Lectures, 1891; J. Eck, Incarnation, 1902; C. Lattey, The Inva. nation, 1926; A. E. Rawlinson, Essays on the Trinity and the Incarnation, 1926. and the Incornation, 1928. Incas of Peru, see PERU.

Ince-in-Makerfield in, and urb. dist., Lancashire, England, in part div of Ince. It stands on the Leeds and Liverpool Canal, I m. S.E. of Wigan. It has Canal, 1 m. S.E. of Wigan. It has collieries, iron and waggon works, cotton Pop. 19,700. mills, etc.

Incondiarism, see Auson.

Incense (Lat. incensum, from incendere, to birn), perfume arising from the fumi-gation of resins, gums, balsams, etc., used in public worship from a very early date, and prevailing in many anet, religious; but its use was not generally adopted in the christian church till the sixth century, in the time of Gregory the Great. is no regular tormula for the preparation, but the ingredients, after having been well mingled, are placed in the conser or thurible and sprinkled over the hot charcoal contained therein, when they at once become volatilised, and diffuse their odour through the building. In the Catholic Church, I. is chiefly used in the oncharistic sacrifice and Benediction (q.c.). 1. has symbolic significance of zeal, virtue. and the ascent of prayer to God. In the last half-century its use was abolished in the Reference churches, but has been restored to a certain extent in the Anglican communion.

Incest, sexual intercourse between persons prohibited from marrying by reason of kinship or affinity. Formerly I, was

the offence. But by the incest Act, 1908, intercourse by a male with his grand-daughter, daughter, sister, or mother, is a muchable with negal misdemeanour punishable with penal servitude. Consent of the female is no defence, and a consenting female is liable to the same punishment. 'Brother' and sister' as used in the Act include half 'sister' as used in the Act include half brother and half-sister. No prosecution may take place without the sanction of the Attorney-General. The Act does not extend to Scotland, because I. was already a crime in Scots law. Although marriage with a deceased wife's sister is now Lawful (see Deceased Wife's sister is now Lawful (see Deceased Wife's sister will enable a wife to obtain a divorce on the ground of nucestnous adultery. In the ground of nicestnous adultery. primitive tribes the prohibition of con-sauguncous marriages is a slow development. Sir James Frazer, in dealing with totemsm in relation to exogamy, is too prone to dogmatise on the origin of the aversion to incestuous unions. Whether that aversion sprang from religious or Whether merely ethical sentiments, or from a perception of disastrous effects on racial development, is a question the answer to which depends mainly on conjecture. See which depends mainly on conjecture, so, L. H. Morgan, Ameient Society, 1877; Sir J. G. Frazer, Tolemism, 1887; and H. Spencer on 'Punaluan Groups,' in the Pracciples of Sociology, 1910. Inch, from the Gaelic word innis, mean-

men, from the casene were arms, meaning a small is, or a land by a riv., found in the geographical names of Scotland and Ireland. It is also used locally of a meadow by a riv., as the 'Inches of Perth,' and sometimes in the sense of rising ground in the midst of a plain.

Inchbald, Elizabeth inte Simpson) (1753-1821), knr. actress, married at the age of nmeteen Joseph Inchbald, an actor. She was now able to fulfil her desire and go on the stage. She made her debut in the provs. as Cordelia to her husband's Until bis death in 1779, they touted the country; but then she secured an engagement in London, where she remained until her retirement in 1789. She never achieved any great fame as an actre-s. Mrs Inchbald began writing plays at in early uge, but the arst piece that was produced was The Mogal Tale, at the Haymarket in 1781. In all, she wrote or adapted some twenty plays, but none met with any great success. Better known than these is her romance A Simple Tale (1791), which attracted much attention. and is her best work. In 1806 she began to edit The British Theatre, in twenty-five vols, and this is a collection of considerable value to students of the drama. a biography of 1, by James Boaden (1833).

Incheaps Rock, see BELL ROCK. Inchealm, or Island of Columbs, in the with of Forth, forming part of the par, of Aberdour, Frieshire, Scotland. It con-tains a fine Augustinian momentary found-ed in 1123 by Alexander I.; the church, chapter house, refuctory, cloisters, and a square tower being still preserved. There of kinship or affinity. Formerly I, was is also an anet, stoneroofed oratory, supnot a crime by Eng. law, except in so far posed to have been a hermit's cell. From

In Cona Domini, papal bull the com in Gena Domini, papal buil the coin menting words of which were. In Coina Domini, formerly issued every year in Holy Week. Its object was to publish the papal consure of all hereards whisms, and infractions of papal privileges, and various temporal crimes. It was first pub in 1361 and was only discontinued in 1770, when the Pope yielded to the opposition of the European kings who objected to the bull as a limitation of their sovereign. to the bull as a limitation of their sovereign authority.

Income Tax, tax on income from what-soever source derived graduated accord-ing to the amount of income and with a diffcientiation in certain cases between carned and uncarned meome. The I I as a general tax on property and employ ments was first imposed by Pitt in 1799 as a war tax. It was a tempolary impose tion on income itom land, personal property trades professions offices, pensions, strends and employments, and also upon incomes arising out of Great But in ind was griduated on all incomes ranging from 460 to £200 a year, with a tax of 10 per cent on incomes above £200 When the war with I rance broke out again in 1803, Addington is imposed the tax at the rate of 5 per cent on incomes of 4150 a year and over But the Income Inx Act of 1803 did not require a general return of income from all source as had the Act of 1799 but only puthenlar returns of income from puthenlar sources. In 1805 Pitt, having returned to power, continued the tax, and added one fourth to all the rutes after the death of Pitt augmented the rate to 10 per cint and from that year the tax was ontinued and increased from time to time until its abrogation in 1515 in these earlier lets there was some principle of differentiation eg in the Act of 1806 the exemption of incomes not over t 0 was only allowed where the income was drived from labour viz from pro-fessions treus and offices. The prinfessions treus and offices ciple of exemption by way of allowance for children was adopted in the cirliest Act, but discontinued in 1800. In the first but discontinued in 1800. In the first year of its imposition the L. L. pr. duced over at 000 000. In 1815. 414 320 000 Regarded of first and oven now in theory as essentially a war tax, it was not revived again until beel for merely fiscal purposes m 1812 imposed it at the rate of 7d in the round or about 3 per cent adopting in his act the groundwork of the Act of 1800 But the limit of exemption rose to the and was mad are pective of the incle of derivation Faitners were taxed on a lower estimate of their profits and giswith and tailway companies were brought in Although in 1842 it was im posed for three years only, it has been confinued ever since and has now definitely lost all semblance of a temporary war tax Glalstone in 1853 extended its operation to Ir land and so made it universil in the kmgdom The principal change has been the demogratic one of granting relief in respect of carned mediae in to \$2000. and imporment super tax on incomes over £ 000

the provision; relating to the rate, colliction and assessment of the I T inn clistely prior to the changes intro-duced by the Finance Act of 1909 will be conducte to a clearer appreciation of those changes, and may be summarised. For the most part the provisions as to administration and incidence have undergone no alteration. It was divided into five schedules according to the different sources of income Schedule A formed the charge on the owners of land and houses It on the benefit arising out of the use of occupation of land, which benefit was measured by a proportion of the rent or an. value; C related to income from any public revenue, imperial, colonial, or foreign; D, income from professions, trades, and other occupations, together with all such incomes as were not included in any of the other schedules; and E was a charge on persons employed by the state or engaged in any other office of profit in a public corporation or company. Incomes not exceeding £160 were totally exempt; real property exempt included public parks and recreation grounds, prisons, public offices, or other crown property, and canals, mines, quarries, etc., from which no income or benefit is derived beyond the general profits of the concern to which they belong. Other exemptions were incomes from property held on trust for charitable purposes in so far as applied to such purposes, the stock dividends or other income of friendly societies (q.r.), and of industrial and provident societies (see under Friendly Societies). Incomes of individuals not exceeding \$100 were allowed an abatement of £160; not exceeding \$500, of \$150; not exceeding \$500, of \$120; and not exceeding \$700, of \$70. An all columns for premiums for life assurance, not exceeding one-sixth of the income, was also allowed. The relief to 'earned' incomes was a reduction of 3d. in the pound upon the rate paid on uncarned incomes. The general rate was 1s. in the pound, and 9d. in the case of carned incomes not exerciting \$2000. The tax was granted for a year only, but annually renewed. The axessment and collection of the tax was entrusted for the most part to local commissioners, known as general or dist. commissioners, appointed by the Land Tax Commissioners out of their own bods. and not in any way subject to the control of the gov. These commissioners received no remnueration, although exempted from parachal offices and jury service. Their duties consist in signing and allowing I. T. assessments, and hearing appeals. They also appoint local graviting relief in I. T. in favour of carned officers for I. T. purposes. There are also a moone as compared with investment inspecial salaried commissioners appointed by the crown to make assessments under Schedule C, and, where the tax-payer elects, under Schedule D; also to assessatively companies and dividends out of foreign and colonial stocks, lunds, or other revenues. Special commissioners may hear appeals from their own or the assessments of local commissioners. The assessments of the salaries under Schedule E are made by the commissioners for public offices. The duty of a collector is to obtain payment of the I. T. from the persons on whom it is imposed, and for this purpose he is supplied with warrants to enforce payment. As indicated above, must of these provisions are re-enacted annually, and to ensure collections in due time these provisions and all enactments income is made by deducting one-sixth relating to I. T., not specifically repealed, have full force as soon as the tax is granted in any Finance Act (see Section 18 (2) of the Finance Act, 1907). A Select Comtitive of the amount of the total income, unittee was appointed in 1906 to inquire but must not exceed £250 for any one

into the question of graduating the I. T., and recommended a partial graduation by an extension of the existing system of abatements, even up to incomes of £1000 or more. They also recommended graduation by a super-tax, and a differentiation between carned and uncurned incomes, to be limited to incomes not exceeding 23000 a vear. Some of these recommendations found expression in the Finance Act, 1909–10.

The f. T. year is from April 6 to the following April 5. The standard rates of 1. f. between 1812 43 to 1854–55 was 7d...

in 1555 56, 19, 2d.; 1856-58, 18, 4d.; it was then below 1s, until 1900-01, when it rose to 1s.; in 1915 16 it was 3s.; 1916-17 and 1917 18 it rose to 5s., and thereafter was as follows: 1914-19 to 1921 22, 6s.; and ranged between 4s. in 1920 26 to 7s. in 1939-40; 8s. 6d. in 1940 41, 10s. in 1941-12 to 1944 16, and was reduced to 9s. in 1946 47.
The Sur-Tax replaced the super-Tax,

which was levied up to and including the Super-Tax year 1925 29. The Sur-Tax is in effect a deferred in-talment of I. T. payable on Jan. I after the end of the I. T. vear. Sur-Tax is at the following rates: m respect of the first £2000 rd; tax chargeable on every t of meome .

2.001 to 2,501 to 2,500 2. 0d. 24. 6d. 5. 6d. 3,000 3.001 to 1,000 1,001 to 5,001 to 5,000 6,000 14. 6d. 55. Gd. 6,001 to 3.00 J lis. hd. 8,601 to 10,000 10,001 to 15,000 78. vd. 84. 64. 12,001 to 15,000 98. 6d. 15,001 to 20,000 10s, 0d.

In the Finance Act, 1940, power was given to reduce the basic figure for Sur-Tax purposes to \$1500; but no action has been taken under the Act, and \$2000 remains the basic figure.

come. Abatement was also granted in respect of the number of members in the tay payer's family.

The terms 'assessable' and 'taxable' as applied to incomes were employed for the ust time in relation to L.T. 'Assessable income,' in the case of carned income, means the amount of such meeme as computed for I. T. purposes, after deducting the amount of the 'e irned' income allowance, and in the case of other income, the actual amount of such income acomputed for I. T. purposes. 'Taxable Income' means that part of the 'assessable income' upon which I. T. is actually charged, i.e. the 'assessable income' loss the various deductions by way of relief.

The differentiation in favour of 'earned'

individual. An allowance is also made of one-eighth of the uncarned income of persons of the ago of 65 years and upwards whose total income does not exceed 2500. This allowance is granted, in the case of a married couple, whether either the husband or his wife, living with him, has reached the age of 65 at the com-mensement of the year of assessment, but

the joint total income must in such a case fall within the prescribed limits.

Deductions from assessable income in

order to arrive at taxable income. - Exemption from tax may be claimed where the total as essable income does not exceed \$120. Where the taxpayer is not totally exempt, the following are the deductions that may be claimed from the total assessable income in order to arrive at the taxable income and these deductions may be claimed irrespective of the amount of the taxpayer's total income: Personal Allowance may be claimed of £110, or, in the case of an individual whose wife is living with him, £180; If ife's Earned Income: when a taxpayer's total income includes earned income of his wife, the personal allowance of £180 is increased by a sum equal to seven-eighths of the amount of such carned income, subject to a maximum additional allowance of £110; Deduction for Children: a deduction of £60 may be claimed in respect of each child, step-child, or adopted child under the age of 16 or who, if over 16, is receiving full-time instruction at any univ. college, chool, or other educational estab. A claim may also be made in respect of children employed in a trade provided the pay (excluding problems returned) is not over \$13 a year. These deductions are not allowable in respect of children enjoying in their own right incomes exceeding £60 There are also other reliefs in the shape of deductions, in respect of dependent relatives and of wildowed mothers taking charge of children, and in respect of dependent relatives denied unemployment allowance. Allowances may be claimed also on the amount of premiums paid for Life Insurance of the taxpayer or his wife, or in respect of contracts for Deferred Annuties: this relief or allowance is deducted from the amount of tax and calculated at the following rates: one-half the standard rate in the pound on the amount of the premium paid on policies taken out before the above date, a deduction of tax at one-half the standard rate in the pound is allowed on the prominms paid by a claimant whose income does not exceed £1000, at 5s. 3d. in the pound where his income exceeds £1000 and does not exceed £2000, and at 7s. in the pound where his mcome exceeds £2000. All contributions to national insurance, whether paid by employer or employees, are allowed as a deduction from income and not us for insurance premiums.

and not as for insurance premiums,

Post-War Credits.—The large increase in the rate of 1. T. during the Second World War was to some extent mitigated by the proposal (see White Paper entitled Financial Statement (1941-42) S.O. 73) to treat the additional tax payable by each individual taxpayer in respect of the re-

ductions in earned income allowance and ductions in earnest income anomance and the personal allowances a credit to be made available to him after the war. The total cost of post-war credits at the end of the financial year 1945–48 was \$600,000,000. Credits were repaid in 1946 to taxpayers over 65 years of ago.

With respect to Dominion I. T. relief is granted to a person who has paid or is liable to pay United Kingdom I. T. on any part of his income and who proves that he has paid Dominion I. T. for the same year in respect of the same part of his

income.

Perhaps the greatest change which has occurred since the First World War in relation to I. T. is the abolition of the three years' average in the case of assessments of profits of businesses, professions, etc., under schedule D and the substitution of an Assessment on the profits of the preceding year (Finance Act, 1926). By the Finance Act, 1922, certain revocable trusts are assumed by the crown as formed for the purpose of avoiding tax, and provision is made that all income arising in these cases is to be regarded in finance purposes as income of the person who has the power to obtain its enjoyment or the maker of the trust, etc. Finance Act, 1936, also made provision for the prevention of the avoidance of I. T. by trusts and other devices. There are many exceptions to the law made in favour of charities, the general effect of which is that money used or earned directly in connection with charities is free of tax. In respect of the general principles of taxation in so far as they relate to 1. T. the decisions of the Courts have estab. that (1) tax is in respect of income, (2) accretions to cap, are not to be taxed, (3) deductions from income in respect of losses of cap. are not admitted, (1) profits from changing the character of property otherwise than in pursuance of a systematic scheme of profit getting are not chargeable in respect of income, (5) gifts and voluntary allowances or payments are not taxable as income of the recipient, (6) the law leaus in favour of the subject. but hardship is no answer to a claim for tax.

It is interesting to compare the amounts paid in I. T. before the First World War with those paid after that war, and equally instructive to compare these figures with those for the years of the Second World War and after. In 1911-12 the total recepts in the U.K. were £11,315,655, while in 1929-30 the total recepts were while in 1929-30 the total receipts were 2293,816,000 (inclusive of £56,390,000 super tax and surtax). In 1937-38 the total net receipts were £297,861,548; in 1938-39, £336,052,321; in 1939-40, £391,592,899; in 1910-41, £530,765,156; in 1941-42, £775,165,319; in 1912-43, £1,007,312,463; in 1943-44, £1,182,27,889; in 1944-45, £1,361,346,000; in 1947-48, £1,189,728,000; in 1948-49, (estimated), £1,490,000,000. These figures should not be taken as indicating a great increase in national prosperity, but as indicative of the burden laid upon the subject in the form of taxation.

subject in the form of taxation.

With regard to the other countries of Europe, it may safely be asserted that I T. forms a ready but in popular means of raising revenue and in general the

or raising revenue and in general the same broad principles not laid down as in I ngland, viz graduated systems with an initial rebate and alloyances for families. The endeavour to impose an I. T in the U.S.A. in the past met with fluctuating success. As in Ingland, it began as ing success As in 1 ngiand, it began on a war tax when it was imposed by the I ederal Goy, which during the Civil war levied a tax of 3 per cent on all incomes over \$400. It was not altrogated till 1872 but when revived in 1895 the courts declared it to be unconstitutional with the result that the constitution had to be amended to vest in Congress the necessary

authority to impose the tax

On Leb 25, 111, the XVI Amendment of the U.S.A. constitution was declared in force—It stitles that (ongress should have power to kyy and collect taxes on in comes from whatever some derived with out apportionment among the sev states and without regard to any census or counterstron. This amendment was 1st fied by all states except connectius I louida. Pennst) mix Rhode Island Itah and Visitus. Ethe Annual Reports of the commissioners of Inlaud Icereuse. Incommensurable, see (ONNI NEL RABII Incorporated Law Society, society of solicitors estab in 152) to exercise a general control over the interests of Any solicitor practising in Folicitor 4 Great Britain, or who has ceased to prictise, is eligible to membership. The society examines students for all the soli citors' examinations, and makes arrange ments for lectures. It is authorised by statute to inquire into all cases of alleged misconduct on the part of solicitors, and to apport the result of its inquiry to the High Court, the High Court may in its discretion either strike the name of the offending solicitor off the rolls or suspend him from practice. In cases of suspected criminal offences by solicitors the society may report to the Public Prosecutor society has a building in Chancery Lane, London, and a splended library

Incorporeal Chattels and Hereditaments. Incorporcal chattels are the rights or interests incident to personal property. intoiests incut in the patent property of copyrights, patent tights, cash at a bank gos stocks, debentures of companies. Such property is said to be incorporeal because it has only a notional existence as opposed to corporeal chattels, or those having a physical exist-ence. Incorporeal hereditaments are rights over or in connection with the enjoy-

immediate or future possession of the land itself, eg rights of way, advowsons (right of presentation to a vacant living), rents, commonable rights (see COMMON. RIGHT OF) I ornicily the term incorpored hereditament included future estates or interests in land or the right to the future possession by way of reversion of icina need (see I staff, Grant) such of icini nece (see 1 starf, Grant) such memorporcal hereint when said to 'he in grant' (by deed) while corporcal lay in livery ? c' it tusfer of possession was neces u., che tusily to pass them to another As both incorporcal chittels and heredit ments now pass by deed, the distinction between their has no particle all proproces.

procted injortance
Increment Value Duty was introduced
by Mr. I lovd George as Chancellor of the I vehequer in his famous budget of 1909 th auty miposed by the Finance Act of that year was one pound for every five pounds of 'increment value' accoung to luil en (1) sale or lesse (for a period execeding 14 years) (2) Succession (upon death of the owner) (3) Valuation to be notice every infreenth year in a spect of land every infreenth year in a spect of lind held by permanent corporations

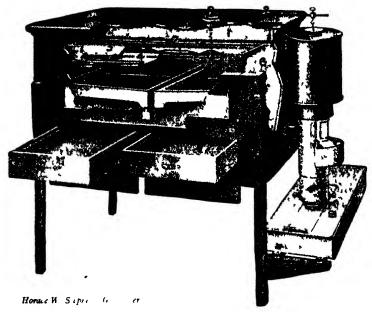

The Act provided that increment value

with amount by which the site value control had the original site value for commissioners of Inland Revenue were made responsible for valuing all 1 nd m the UK, having regard to (1) site value and (2) total value. "Site value was delived as the value of the bare land with it buildings, etc. (these latter being included in the total value) and 'original site value,' as the value of such land on April 0 1909. Agric land was exempt f i the duty so long as its value did not ex end the market value for agric pur the duty a sea failure V iluation I he duty was a failure Valuation was a long, costly, and inquisitive process and the actual return from the tax proved disar pointing The Linance Act of 1920 abelished the duty

Incubation and Incubators from Lat muhire, to brood incumber to he on ci within). I is strictly the a fon of a bud in sitting on her eggs to had h them but the term is also und of the develop n nt of the germs of disease within the the artificial machines (incubators) om it ved in hatching (rgs artificially, or fr similar purpo is in bacteriological lalectiones. In nature I is often the tisk of the femals only, but sometimes the male takes his share as in the case of ostriches and most passerine and run ning birds. In other cases, again, the the high temp thus afforded making broding unnecessiry. The period of in abation varies considerably in length from three weeks with ravens and common fewls, to six or seven with swans and ostil lies, and two weeks or less with swillows. The hallt of brooding over their young is not infrequently found in other creatures as well as in blids, for ex ample, in earwies, centipodes (Scolo pendra), and pythons

Artificial incubation was known from ment of land, as opposed to the right on the earliest times, and practised among huge egg-ovens, types of which are in use by punitive people to the present day. Commercial manuf of incubators began about 1900 and the only machine then made was a hot water type. This in ubater consisted of a double walled abinet with insulation or dead air space between the walls. The interior of the in-

the Chinese and Egyptians by means of whole with hot water pipes running from hure egg-eyens, types of which are in use an authracite boiler. Each compartment could be operated independently but the chief disadvantage to this type of machine was the amount of space nocessary for easy operation. This, together with the amount of labour involved, gradually led to them becoming obsolete

The live st incubator of the type held prox rately 100 hen eggs. Regulation approx nately 100 hen eggs of the to be was obtained by a thermostate apsule filled with other or methylated spirit or a mixture of same This can the typended when haded and the action of the expan ion was used to work either a damper or slide to control entry of the heat into the machine or to allow excess hot air to except from the egg compartment. In order to meet the demands of large poultry keepers who wished to neubate hundreds of eggs at a egg compartment. In order to need the eggs in small units demands of large poultry keepers who wished to neubate inndreds of eggs at a dustry and the exting up of large comtinue, this type of markine was later developed by placing sev of these compartments in long rows and heating the eggs, that would take up little space and

a heating compartment and passed through the machine in metal paper through the minime in tractal pipes. The heating unit can be arranged to work in conjunction with oil lamps, electric heaters or gas burners. This type of me line usually proved to be more sensitive than the hot water model and easier. to work—these incubators are used ex-tensively by pedigree breeders and all poultry farmers who prefer to hatch their

be practically automatic in operation. This need was met by the invention of the Cabinet incubator in the U.S.A. It was later developed and improved in this country and today the Cabinet incubator is a precision built appliance that is practically fool proof.

Usually it consists of a double walled chamber built of selected timber and divided into two compartments. In the setting compartment the trays are so fitted that they can be tilted by some outside medium. In the hatching compartment they are placed at the same level as no turning of eggs is necessary after the nineteenth day. These compartments are heated by electric elements or hot water pipes or a combination of both. The air is circulated by means of a fan which ensures even temp, through the whole of the compartment. This fen can be driven by small electric motors or petrol engines.
The largest Cabinet incubators accom-

modate up to 50,000 eggs in a space little more than 1,000 cubic feet. The temp. and humidity is automatically controlled and when required, the eggs can be autoresent intervals. matically turned present intervals.

Alarm and safety devices are fitted to ensure freedom from breakdown with consequent loss of eggs. These incubators are now used extensively in all parts of the

world.

Artificial I, has the following advantages over the natural process: (1) a much larger over the natural process; (1) a initial larger number of eggs are able to be successfully hatched; (2) the chickens are free from vermin; (3) they are free from the danger of being trodden to death by the hon. Game-keepers use 1. largely for rearing pheasants, and, of course, on large rearing phesonics, and, of course, of target poultry-farms they are indispensable. Various forms of foster-mothers, arti-ficially warmed by lamps or hot water, have also been contrived in which the chickens can be successfully reared after there are bottched. In due courses they are they are hatched. In due course they are moved to cold brooders, and finally to poultryhouses.

Bacteriological I. differ from those for birds in that the heating surface generally surrounds all sides of the L. chamber, and there is usually no special apparatus for keeping the air moist. There are various forms, some hoated by warm water, others by warm air. They are mostly square or rectangular in shape, but some bacterio-

logists prefer cylindrical forms.

Human I, have also been designed for by two Ger, printers, sweynheym and rearing children too weak to survive under | Panuartz, who set up a press at the man isordinary conditions. The first was that of lp. Tarnier (1880), used in Paris, and an improvement was made in Heer-on's, which is used at various hospitals and

institutions throughout Great Britain.

See T. Christy, jun., Hydro-Incubation:
L. Wright, The Book of Poultry, 1911; J. H. L. Wright, the Book of Fourty, 1811; S. H. Sutcliffe, Incubators and their Management: H. H. Stoddard, The New Egg Farm. For becteriological I., see catalogues of Hearson of London; Cambridge Scientific Instrument Co., Cambridge;

signify 'diligent residence,' or 'assiduous application to duties.' In eccles, law it includes such rectors, vicars, and perpetual curates as have been duly instituted in their offices. Every I., or holder of a parochial benefice, has care of souls in his parfocular offences, has care or some in measurements own par. (see impropriation), and it is a spiritual offence for any other clergyman to preach, read prayers, or otherwise officiate in the par. of another I. without authorisation of the diocesan bishop. An I. is ex officio chairman of the vestry, and upon lain devolves the duty of keeping the local register of marriages, baptisms, and burials. Two Is. may in certain circumstances effect an exchange of livings (see also GLEBE, as to extending noor hvings) by deed. An I. may be deprived of his living for illiteracy, minority, sunouncal offences trafficking in benefices), lack of holy orders, conviction for factors. felony, and other crimes, and such spiritual offences as affirming doctrines (on-trary to the Thirty-nine Articles, heresy, schism, and demanding payment for administering a sacrament. An I. may resign by application to the ordinary, but a resignation is invalid unless assented to by the bishop.

Incunabula is a word derived from the Lat meaning a cradle or by., but has come to be used in a very specialised sense to signify the earliest books printed from type, and more particularly those printed before the year 1500. Since the invention of printing in Europe is generally attributed to the invention of printing in Europe is generally attributed to the forest whose the books are ted to Gutenberg whose first books appeared about half-way through the fifteenth century, we are limited by definition to e period of about filty years. The rival claim that printing was invented earlier in the century by Laurenz Coster of Haarlem is without corroboration, and in fact there are no known books in exist-time hearing his imprint. The first book is and by Gutenberg, probably in collaboration with John Fust, was the Mazarin Bible which was printed in a Oot sie type, with initials and ornamental borders illu-minated by hand. It is interesting to note that the early printers aimed not at creating a new style smitable to the medium of type, but emulated the flu st examples of existing illuminated manuscripts. Chu famong the notable books which came from this press were the Psatter of 1457. the first book in the last, of printing to bear a date, and the Latin Bible of 1482.

Franting was first introduced into Italy

tery of Subiaco in about 1464, and this country rapidly achieved supremacy in the art. Venice became pre-eminently the centre, attracting many printers, among them ba spira, Jenson, Ratdelt and, later, Aldus. The It. MSS. of the time to which these printers turned for their models vire written in the humanistic script, a refinement of the caroline minuscule. This round, cursive and easily legible hand became, fortunately for the avesight of the modern would the Scientisto Instrument Co., Cambridge; for the eyesight of the modern world, the and P. Lequeux, Paris.

Incumbent (Lat. incumbo, I bend or roman' type-faces, Germany, the only tean), word which is said variously to country not to adopt this design, still uses

type-faces based on the Gothlo letter, or lettre de forme. 'The length of the eds, of the earliest books was governed chiefly by the capacity of the type to stand up to the printing press, and numbers averaged about 200-300 copies, rising to about 500 by the end of the century. The fact that the total number of books printed in Venice alone by the end of the century is estimated to have been about two million, gives some idea of the rapid expansion of printing from its inception. Paper, then a staple product of Italy, was chiefly used for books, though frequently a smaller part of an ed. was printed on vellum. Many eds. were illustrated with woodcuts, some of which were afterwards illuminated by hand. A notable illustrated book was Hypnerotomachia Polifili which red over 500 woodcuts. Caxton Aldus' contained over 300 woodcuts. Carton set up his press at Westminster in 1476, though his first book, The Histories of Troy, also the first to be printed in Eng., was printed at Bruges a year earlier. This was followed by an ed. of the Canter-bury Tales, and in 1481 he issued his first illustrated book, The Mirror of the World. Caxton used a formal Gothic type and also 'secretary,' a cursive version of the same face. His achievement lay not so much in the quality of his work which was not equal to the best It. printing of the time, as in the fact that his prolific output did much to establish a national Eng. language.

The difficulties of establishing classifi-cations of I. spring from the fact that so many early books are not only undated, many early books are not only undated, but also bear no pruter's name. Identification is most safely made from the type-face. Haebler's Tupenreperforium der Wiegendruck (1905) takes this approach. Other earlier olbilographies are Panzer's Annales Typographic (Nuremberg 1793), and Hain's Repertorium Bibliographicum (Stattgart 1426-38). In more cent times we have Robert Prices more recent times we have Robert Proctor's Index to the early printed books in the British Museum (1893) which has been revised and expanded since the author's death.

Indecent exposure of the person in public is a common law misdemeanour, punishable by tine or imprisoument with hard labour or both, whether there be an intention to violate the canons of decency or not. The public exhibition of ob-cene writings, pictures, or photo-graphs is punishable by fine and imprisonment, and magistrates have power to issue search warrants for the seizure and destruction of obscene books or pictures in places where such articles are suspected to be sold or deal with for profit. Advertisements dealing with venereal diseases also come within the Acts prohibiting the exhibition of in-Acts prohibiting the exhibition of in-decent writing or prints, and are punish-able on summary conviction with one month's imprisonment or a fine of 10s. Sending indecent prints, books, etc., through the post is punishable either on indictment with twelve months' imprison-ment with hard labour, or summarily by a fine of \$10. An indecent assault mon

not exceeding two years, under the Offences against the Person Act, 1861. Sodomy or bestiality is a felony punishable by penal servitude for life, or imable by penal servitude for life, or imprisonment, not exceeding two years, with or without hard labour. The Criminal Law Amendment Act, 1885, provides a punishment of not more than two years imprisonment with or without hard labour, in the case of any male person publicly or privately committing, or being a party to the commission of, any act of gross I., with any other male person. Scots law is practically similar in all respects.

'Indefatigable,' The, Brit. battle-cruiser launched in 1911, 12-in. guns, 23 knots. On the outbrenk of the First World War she was stationed in the Meditorranean. During the battle of Jutland (q.r.) she was a unit in Adm. Beatty's fleet, but was sunk by the Ger. battle-cruiser Von der Tann. A Brit. fleet air 1939, now bears the name.

Indefinite, in mathematics, was originally used for infinite, but at the present time is generally only to be found in the phrase I. integral, to denote the process of integration, without reference to limits. $\int x^n dx$ and $\int a^n x^n dx$ are respectively I. and

dofinite integrals.

Indemnity, contract, express or implied, to keep a person unmune from liability under a contract into which he has entered, or intends to enter. Contracts of fire, marine, and accident insurance (but not life assurance) are instances of such contracts. An I. differs from a contract of guarantee or suretyship, because the liability of a guarantor or surety depends upon a third person, the prin debtor, making default, whereas the person under a liability to indemnify another is bound a hability to indemning another is bound to do so, irrespective of the default of other persons. A contract of I. is not, but a guarantee is, within the Statute of Francis (see CONTRACT, and FRAUDS, STATITE OF), and, therefore, the form of an I is inmutaerial. Other familiar examples of is, are the implied contracts by one to independ their negretally deports prins, to indemnify their accredited agents from all hability properly incurred in rela-tion to the agency. This print in the law of agency also applies as between partners. A contract to indemnify a person against liability for an unlawful act is void. In a wider sense L councies that unwritten prin. of our law which enjoins the obligation of the state to compensate a person whose private property has been com-pulsorily taken for public purposes; a prin. which, in particular cases, finds statutory expression in various private Acts of parliament supplemented by the Lands Clauses Acts.

Indenture, practically synonymous with a deed (q.r.), since the requirement of 'indenting' the edges became unnecessary to the validity of an instrument. An L. was an instrument made between two or more persons with distinct interests, as opposed to a deed poll or instrument made ment with hard labour, or community upon opposed to a deed pon or insertains fine of \$10. An indecent assault upon opposed to a deed pon or insertains having identical interests. Formerly, copies of for nothing to-day. Its fall after the an instrument were always made on the First World War was due to faction. A same parchiment, or paner, and then cut into as many parts as there were copies, with a wavy or scalloped line, so that the genuineness of any part could at any future time be estab. by merely fitting that edges together. Other formalities having taken the place of 'indenting,' the defeated that the place of 'indenting,' the place of 'indenting,' the place of 'inde signation of a deed as an 1. is now more surplusage.

Independence: (1) The cap, of Buchanan co., lown, U.S.A. It is situated on the illinois Central, and on the Chicago Rock Island and Pacific Railroads, also on the Wap-spinicon R. The tn. is noted for farming, and has iron foundries. Pop. 1,300. (2) The cap. of Montgomery co., Kansas, U.S.A. It is situated on the Verdigris R., and on the Atchison, Topeka, and Santa Fc, and the Missouri Paeric Rul roads. It is the centre of a natural oil and gas region. The chief industries are agriculture and the manuf. of cotton. Pop. 11 500 11,500.

Independence, American War of, see UNITED STATES OF AMERICA, History. Independence Day, commemoration observed in the U.S. on July 4. It is a legal holiday, and is kept up by various celebrations, such as patriotic speeches and meetings. It commemorates the Declaration of Independence on July 1. 1776.

Independence, Declaration of, see DL-CLARATION OF INDEPENDENCE.

Independence Hall, building in Philadelphia, where, on July 1, 1776, the Declaration of Independence was adopted by Congress and read to the people. The Continental Congress met there. It is now used as an historical museum.

Independent Labour Party (the ' I.L.P.'), throughout the greater part of its list, the largest and most influential of Brit. Socialist organisations. The LLP, was founded at a conference field at Bradford in 1893 over which J. Keir Hardle, M.P., presided, and, as illustrative of the close connection of the man with the party it may be mentioned that Keir Hardie was elected in 1913 to the chairmanship, so that he might preside over the comingchair no might preside over the coming-of-age conference. Other distinguished chairmen have been J. Ramsay Mac-Donald, M.P., and Philip Snowden, M.P. (later Lord Snowden). The fortunes of the I.I.P. have been intimately bound up with those of the Labour Party which it created and to a certain extent dominated. On Feb. 17, 1930, the Prime Minister, Ramsay MacDonald, severed his connecramsay macronaus severed his connection with the I. L.P., an example that was almost immediately followed by Philip Snowden, the Chancellor of the Exchoquer. The reason for these realguations was that during the last few years the organisation had increasingly adopted the policy and approved the actions of the more advanced section of the Labour Party in the House of Commons.

substantial section of its membership was strongly pro-Soviet, and a part broke away when the Communist Party was formed. The LLP, became the advocate of 'Socialism in our time' and at one Labour Party Conference after another its socialist resolutions were voted down by the trade union block vote. The ex-perience of the second MacDonald Gov. brought the dispute to its crisis, and the L.P. under James Maxton seceeded from the Labour Party and, in the secession, the Labour Farty and, in the secression, split again, the antiscressionists joining with Sir Stafford Cripps and Mr. Ernest Beynn's Society for Socialist Inquiry and Propaganda to form the short-lived Socialist League. What remained of the Socialist League, What remained is the socialist League. I.L.P. under Maxton had its main influcure on (I, deside. In the Second World World War it was 'anti-war,' not on pacifist grounds, but because it persisted in design of the control of the contr socialists can unite with capitalist parties in any circumstances without betraying So mism. It is not a little ironical that the present Labour Party Gov, has not only passed sev, nationalisation Bills but would seem to be committed to a policy of Socialism well within our time.

Independent Order of Oddfellows, see ODDILI LOWS.

Independents, or Congregationalists, see CONGREGATIONALISM.

Indeterminate, in mathematics, used in in mathematics, used in sect. connections. Simultaneous equations are called 1, when an insufficient number of such equations is given. Thus the equation 5r + 3y = 21, where x and y are independent unknown quantities, is L_s . and has an infinite number of solutions. In the differential calculus the name Indeterminate is given to such expres-

sions as the limit of $\frac{a^2-y}{a-x}$ when x=a, which take the form " or 'imil'er forms.

su h as on, 0 x on, etc.

is one of the fundamental laws of algebra. and is known as the Index Law. So also $a' \cdot a^n = a^{m-n}$, and $(a^m)^n = a^{mn}$. It has been found convenient to make use also of fractional and negative indices. which at first sight seem unintelligible. To ensure that the Index Law $a^m \times a^n = a^n$ shall be true for all values of m and n, integrel and fractional, positive and negative, we give to such quantities Maxton, the leader of this small but energetic group and one of the severest critics of the Labour Cabinet, then became the formula leads us. Thus $a^{\frac{1}{2}} \times a^{\frac{1}{2}} = 0$ chairman of the I.L.P., and held the post again from 1934–39. The I.L.P. counts

also $a \times a^4 =$ gonerally 1 and a × a 4 $a^{*} = \frac{1}{a^{*}}$ and more $= a^4 - a^0 = 1$ generally $a^n = \frac{1}{a}$ See also Log Arithms

Indexing, operation of compling an alphabetical list of statements and allusions contained in files or in a book or sions contained in files or in a book or series of books or periodicals, together with the page number folio number or other r ference to where the indexed matter is to be found. An Index differs from a 'table of contents' by being a more complete analysis of the contents, and by heing arranged in alphabetical order. The term as applied to the I of books and periodicals have been in use since the six teenth century and derives from the Lat. teenth century and derives from the Lat word index which was used by (icero and other classical writers in the same sense Calendar, inventory and register were alternative terms which have now been super-seded Specialised I such as that of the contents of a library is more properly termed cat doguing (20), while an index of the works it a single author or a works on a given sulject comes under the healing of bibli graphy (q t) There were a number of indexes to books pub in the sixteenth century among the most notable being that to the 1 156 ed of Poly dore Vergil's Anglica Historia Many in dexes of the seventeenth and eighteenth centuries were intended more as whimseld enticements to the realer to dip into the contents rather than as a sorious unity is of the subject matter. The index of the Spectutor, Latter, and Guardian (17.7) was, Spectutor, I atter, an I Guardian (17.7) was, however, a model of its kind. During the nineteenth century and after, a number of scientific and informative works have made I an indispensible ind to the reader while the growth of periodical writing brought into being a number of cumulative indexes, an early example of which was W. F. Pooles Index to I created I therefore a time? (New York, 18.3) A 'general' index contains entire under proper pages and subject to drive the driver. names, place names and subject headings. It may however be advisible to provide two indexes to a single work one being an Index of names and the other an Index of Subjects In a subject indea the selection of catchwords presents the indexer with a problem which he can only solve by an problem which he can only solve by an understanding of his suth it and by an assessment of what the relier to whom the work may be unknown whild look for Corrict alphabetical order is never so simple a process as it may seen to the in experienced. It should be carried through either to the end of the initial word or to the end of the initial group of words, that is, to the first mark of punctuation If, however there are two or more entries with idential cat theords, as may happen when indexing references to two persons with the same name, then the order is decided by the words (e.g. Christian name or initials) which follow the comma after the catchword Indexes prepared for press may be compiled either on the slip

system or the card system. The slip system consists of allotting a slip to each letter of the alphabet or each subdivision of a letter (* g , As-Ak, Al-Aq, Ar Az)
The entries are then made on the appropriate slip. The card system differs from
this in that each reference is written on a separate card which bears the appropriate catchword as a heading. The cards ma-then be sorted into alphabetical order and ed when all the entries are complete. The ny nifon of the card index system is attributed to the Abbo Jean Roder (1734), whose I this des Vémotres de Le term des senes was pub in 177. It is the only suital to notice for company to the control of the control pling an expansive index of eg files to when contain additions are being made. In book and ving if the eleminate of references under on entry the references should themselves be classified under a properties sub-headings which may be arranged either alphabetically of the properties of the reference of the refer may be arranged either alphabetically or in chronological order or in the order in which the appear in the our e of the box—the choice being determined by the nature of the work to be indexed. So H. B. Wheetley, How to make an Inter 190.—C. R. Cutter Lules for a Dictionary (at digue (4th ed.) 1904.—A. I. Clark Manual of Practical Interior, 1333. Index Librorum Prohibitorum the title of what of hoose we shipted by the Lee-

of a list of books prohibited by the Lea Church on doctrinal or moral ground the onem of eccles prohibitions duce from a very culy pened in the hist of the Church and the culiest known in stince is the Value Librarum, spoery Il rum pur non recipiuntur restalorne of forbillen apoeryphal work issued by Pope Gelagias (414) Whit may be re garled as the first Itom Index was pub-by tops Paul V (1) 1 9) through the In maxion at Lome and was confirmed by (1 nent VIII in 1) When the books in the list or catalogue are allowed to be real after execution or alteration with the expressed of the orders of the papid authorities the list is termed Inder I rpargatorius Later Pope Sixtus V organised a special congregation, con sisting of a prefice cardinals consultors and examiners of bools the proceedings being giverned by rules laid down by Pope Lendut XIV in a constitution issued in 1753. All books considered permeables to its in Catholics and all ver sions of the Bible by un authorised persons are place on the Index by the Congrega tion of the Holy Office

Obscene books are forbidden except 'classical uithors, ancient or modern 'classical uthors, anclost or medicinon a count of the elegand of their diction which are not to be used for teaching children. The ban still remains on Gibbons Declar and Fall The works of David Hum John Stuart Mill and Oliver Goldsmith for his histor of England) are proscribed slong with Stories for his Sentimental Journ y Savonarola, Kant, Voltaire, and Groce share the Index pages with Steindhal and D Annunzio. The Book of Common Prayer is also banned Dante, Copernicus, and Galen have been removed.

have been removed

Any living author placed on the Index

can earn remission by re-writing his book or cutting out the offending passages, Permissions to read forbidden books are granted to students. See T. Hurley, Commentary on the Present Index Legisla-

tion, 1908.

India, extensive peninsula or sub-continent of S. Asia; after China the most populous country in the world. The pop. of the country approaches 400,000,000 and is composed of a heterogeneous mass of various nations, having different lan-guages, faiths, and customs. Since the beginning of the seventeenth century the hist, of I. has been closely connected with that of it may been closely connected with that of Great Britain. In course of time it became a dependency of the Brit, empire and afforded a lunge mikt, for her produce and also a great held for Brit, capitalists. At the same time it developed a great number of highly profitable secondary industries of its own. The name by which the country is known, 'India,' is derived from the Persian name Hind, which has been handed down to us through the Gks, and Roms. This name is derived from the Sanskit name given to the R. Indus (Sindhus). At times the name Hindustan is been applied to the whole peninsua, but the is incorrect, since the name applies only to a particular region of that country. The natives of I. region of that country. The natives of I. are so mixed that they have no one name for the country but after the Brit, occupation the official native form of the name was tixed as Hand and the Anglicised form as I. The Indian Independence Act, 1917, brought to an end the whole structure of Brit. Gov. in L. and from Aug. 15 (1947) the Indian Empire is represented by the dominion of 1., the dominion of Pakistan, and Ters. of Indian rulers function, and ters, of indeat riners formerly under the suzeranty of the King-Emperor. Except where otherwise stated herein 'India' includes the dominion on Republic) of L., the dominion of Pakistan, the states of L., and Tribal Areas. Fuller details for Pakistan under most heads will be found in the separate article PARISTAN.

Boundaries: Ara and Population.—
The political boundary of L marches with Persia and Afghamstan from the gulf of Oman to Povalo Schveikewski on the Taghdurbash Pamir. From this point the frontier, in many parts not clearly defined, touches the Chioses Empire and Nepal, up to the limits of Burina. Continental L, including Baluchistan, extends from 8° to 77° N. lat., and from 61° to 97° E. long. bellif, the cap. of the dominion of L, lies in 77° E. long., Kauschi (sind), the cap. of the dominion of L, lies in 77° E. long., The total area of L proper in 1911 was 1.581.410 sq. un, with a pop. of nearly 389,000,000. The Brit. provs., as distinguished from the Indian states, comprised 55 per cent of the area and about 76 per cent of the pop.

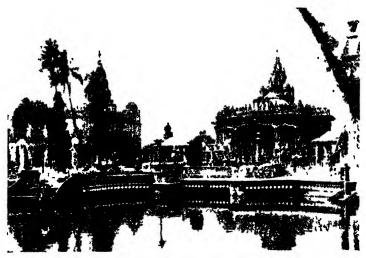

The country.—L is a large peninsula which juts out southward from the main-

which juts out southward from the mainland of S. Asia. It is a triangle in form, the huge mt. ranges of the Himalayas forming the base of the triangle, whilst the apex runs far out into the Indian Ocean. In its W. coast it is washed by the waters

of the Arabian Sea, whilst on the E. is found the bay of Bengal. The extreme length of I. is about 1900 m., and its breadth, at its widest part, is about 1600 m., but the peninsula tapers down almost to a fine point, its S. extremity being Cape Comorin. The southernmost mant is in the year centre of the translet. nont is in the very centre of the tropical region, its lat, being about 8°, whilst the most northerly point is found well within the limits of the temperate zone, i.e. 37° N. Thus the peninsula experiences extremes of weather. The official designation 1. includes not only the peninsula already described, but also Burma on the b. together with the is. of the Arabian Sea, and the bay of Bengal, and Aden and Perun, all of which are politically admin-istered as 1. On the other hand, Ceylon, an is, adjacent to the S.E. coast of I., is treated and administered separately. In former days—the days of the great companes I. was by no means altogether under the sway of the Brit., for the Dutch, Portuguese, and Fr. had settlements on the coast also. The remains of these settlement may be traced in the various that which belong to the Fr. and Portuguese which belong to the Fr. and Portuguese even at the present day, e.g. Goa (Portugue). Pondicherry (Fr.). The chlof houndaries of I. are: On the N., the limidaya Mts., which separate Tibet and Chiri; on the W., the Suliman Mts., which separate it from Afghanistan and Bahuchstan; on the S. and S.W., the Araban Sea and the Indian Ocean: on the S. and S.W., the Araban Sea and the Indian Ocean: the k., the spurs of the Himalayas, which separate it from Burma, and the bay of Bengal, an inlet of the Indian Ocean. The geography of I. can be the more easily examined and followed if we divide the examined and followed if we divide the whole country up into the three natural divs. into which it falls: (1) The int. ianges, i.e. the Himalavas; (2) the riv. plains; (3) the peninsula real, or the plateau of 1., which goes by the name of the Decean. (1) The Himalavas; This series of int ranges is the heriest int. system of the world. The range extends for a distance of 1500 m. roue? the N. band live of I and system or the N. boundary of I., and sweeps round in a half bend. The most procuptous face of the mts. is the S., forming an almost, but pot altogether, impassable boundary, two places the mt. since is severed by straine the Dihang R in the L., and the Indus in the W. The mts. soar to a height in places of nearly 30,000 ft, and are continually snow-covered. Nevertheless, since time immemorial distinct and well-known trade routes have been known and communications kept op with the countries N. of the Himalay is in spite of the barrier of the ints. The Himalayas form a double boundary to the N. of I. and send out also spurs and offshoots which fill the country between the Ganges and the parent inte-themselves. On the W. this offshoot is known by the ame of the Suliman Mis.; on the N.E. it forms the boundary between Assam and I., being known as the Naga Mis. The boundary between I, and Baluchistan is also formed by the off-shoots of the Himalayas, but these latter offshoots by no means attain the clevation

of the others mentioned. The chief passes of the mountainous div. of L are the Khyber Pass, the Kurram Pass, the Gemal Pass, and the Bolan Pass, Those form the chief means of communication between L and the N.W. See also HIMMAN MOUNTAINS. (2) The river of List the signest was the signest and the street and cation between 1. and the N.W. See also HIMALA A MOUNTAINS. (2) The river plains. This div. of 1. is the richest and most populous part. It extends in a broad helt across practically the widest part of 1, running from E. to W. From the beginning of hist, we find this part of I. the continual prey of marauding tribes, who sweep down from the hills to plunder. Iton between N. and S. firmly estab. The chief provs. of this part of 1, are two sides of this triangular plateau, which Bengal (E. Bengal in Pakistan and W. has the Vindhya Mts for a base, are

This comprises the presidencies of Bombay and Madras, together with the Central Provs., Hyderabad, and Mysore. The name of the Decean was formerly applied to it. Its N. boundary is the Vindhya Mis., a range which stretches for about 500 m. from E. to W., and which has two great peaks at each extremity. In earlier that the formed a fairly affactive burner. days this formed a fairly effective barrier between the N. and the S. of L., since the range varies in height from 3000–4000 ft It has long since, however, been pierced by both road and tailway, and communication between N. and S. firmly estab. The

JAIN TEMPLES AT (ALCUPTA

Bengal in I.), the United Provs., the Punjab (divided between the two dominions), and Rajputana. The unportance of the int. system, the Humilavas, may be judged when we see the effect of it on the well-watered plains. The Iris, system of I. consists of three greaters: the Industite Consists of three greaters and The Iris. the Ganges, and the Bramaputra. The Industrises on the N. slopes of the Himalay as, sweeps round, and enters at the W. extremity of the range, and waters the Punjab. The Ganges is formed by the amalgamation of the streams which drain the southernmost slopes of the Himalayay, whilst the Bramaputra rises also within easy distance of the Indus in the N. slopes of the Hundayas, flows E. N. of the Himalayas, for some considerable distance and then enters I. at the extreme E. point of that range. It is therefore to be noticed that the riv. system, of such vast importance to the people of 1., is the division of the Himalaya Mts. (3) The peninsular proper, the southern plateau of India:

much is proved by the marine deposits of much is proved by the inarine deposits of

formed by the E. Ghats and the W. Ghats The W. Ghats are on an average much loftly than the E. The three chief rise of this dat, are the Godavan, the Kistne, and the Cauvery These rise in the W. Ghits, but discharge into the bay of Bengdon the E. coast. The W Ghats, in fact, form such a strong barrier on the W. coast that the line of mts. is unbroken by a riv. gorge. The rivs. which rise in the a riv. gorge. The rives which rive in the W. Ghats discharging, as already stated, in the bay of Bengal and those which drain the Vindhya Mts. into the gulf of Cambay. Chief amongst the latter may be mentioned the Nerbudda and the Tapit. The three geographical divs. of 1.

appl. The three geographical divs. of I. appl. in other tespects—in speech, language, race, and characteristics.

GIOLOGY The oldest of these three divs is the peninsular proper. If has been land for many thousands of years; indeed it was already dry when the Himanary constructions are served.

the Himalayas. It is in the peninsular that we find the oldest strata; in fact, the age of the Vindhya Mts. cannot be determined. The Himalayan region is one of great compression, in which we find masses of Tertiary rocks of vast thickness. which are overthrust and folded in the most violent fashion. In peninsular I the oldest rocks consist of greiss, granite, and crystalline formations. The rocks of this region are intersected by bands of transition strata of very anct. but undetermined age. The strata are generfound in an undisturbed and the Vindhyan formations, as already mentioned, are of great antiquity. In great contrast to these regions is the region which separates the two, and which is known by the name of the Indo-Gangelie plain. This plain is covered with alluvium and sand blown thither by the winds. There is no rise in lared between the two great rive. the level between the two great rivs, the Indus and the Ganges. The alluvial deposits of the plain have been subjected to frequent examination and prove to us that there has been a gradual depression of that region even within comparatively recent times. The filef deposits which are found in the Inno-Gangetic plain are gravel, sand, and clay, together with deposits of peat and forest beds. The belta deposit has also been subjected to close examination, but its depth at this point capacity. point cannot be exactly calculated. By boring, a depth of some 480 ft. was reached, but this was known not even to approximate to the real depth. In one part of the bay of Bengal, which washes the Delta, the currents have apparently washed away the deposit brought down by the rivs. The depth of the buy here is over 1800 ft., so that, allowing for the fact that the rest of the seundings which are taken in the immediate neighbourhood only give, at most, 10 fathons, we can come to the conclusion that the deposit from the riv. has filled up the bay in that part, and that therefore the alluvial deposit equals the depth of the bay, i.e. about 1800 ft. The alluvial deposit of the plain has been proved by boring to be over 1000 ft. in thickness and we are able to gather that the depression of the Indotangetic plain is of recent date, and that it is probably connected with the elevation of the N. mountainous dist., the Himalayas.

CLIMATE.—Not unnaturally, in a country which stretches from the tropical regions to well into the temperate zone, many differences will be experienced in the climate. Any extreme of climate, then, either of the tropics or of the temperate zone, will be found in 1. Its geographical characteristics have great influence on this, especially the huge mt. barrier of the N., which prevents any inducence of the plateaux of Central Asia, and its peninsular point surrounded by the sea in the S. The whole country experiences three well-marked and well-defined periods either a tropical to the cow, ox, and buffalo. The two latter are used principally as beasts of burdeu, the cow being regarded as a scred animal by the Hindus. Horses are hoteo, but to the rainy seasons. The cool months are experienced during Nov., Dec., Jan., and the early part of Feb. The weather is then at its pleasant-working native pop. Doukeys and mules

est, dry and cool. The hot season which follows belongs, at any rate officially, to March. From this time until the middle of June, there is a continual rise of temp, which is experienced with greatest severity in Central and Southern I. The contrast in temp, during the cool mouths is between N. and S., but during the hot months the contrast is between the interior and the coast. It is in the interior of Northern I. (Punjab) that the greatest temps, are experienced during this period. The monsoons or the rainy season usually begin about the middle of June. These monsoons are caused by the absorption by the sun of moisture from the ocean, and if the monsoons fail, then follows one of those famines which periodically do so much harm to I. The rainy season lasts for about three months, and during that period rain is generally experienced all over I. The rainfall is by no means, however, equal all over I. Parts escally in the Deccan, are left after the rains with a very small supply of water, hence arises the necessity for a good system of irrigation and canals. At one place the average rainfall for the year is 500 in. (Cherrapunji). The season which inmediately follows the rains is the most unhealthy of all. The monsoons cease about the middle of Sept., and the months which follow, Oct. and Nov., may be regarded as the Indian autumn. During this period malaria and malarious diseases are usually rife especially in the N.

are usually rife especially in the N.
I'u v..—The lion, although at one time threatened with extinction, is now found fairly plentifully. A variety pecular to 1., i.c. maneless, is found here. The chief beast of prey, however, is the tiger, which is practically ubiquitous. The advance of civilisation and the attacks made on this animal by sportsmen have caused the tiger to become rarer than formerly, but it is by no means exterminated. man-eating tiger is usually an old animal that has become too enfecbled to be able to eatch his ordinary prey, but kills often from sheer desire to destroy, and is a real curse to the country in which he is found. It is no unusual thing to hear of a man-cating tiger which has killed over 100 presons. The favourite method of tiger shooting is from the backs of elephants. The leopard is found in even greater numbers. The destruction to life and property caused by this animal is enormous. The cheetah is another type often confused with the leopard proper. Amongst the other wild animals to be found are the hear, boar, wolf, fox, bison, elephant, and rhinoceros. Wild goats and wild sheep rinnoceros. Wild goats and wild sheep are found at considerable altitudes in the limidayas. The wild ass is also to be found in parts but is practically unapproachable owing to its timidity and speed. The dome-ticated animals are chiefly the cow, ox, and buffalo. The two latter are used principally as beasts of burden, the cow being regarded as a surred animal by the Hindus. Horses are bred and but wearfly the bread and but wearfly the bread has been

are used very considerably. Sheep and may be regarded as an extension of that goats are plentiful, as is also the pig, but found in the prin, dists, which immediately this latter animal is of little use, since by border on the peninsula, i.e. of China, the majority of the native pop. It is despised and abhorred. Monkeys abound, but they are regarded as sacred, and archerefore in perfect security and become very tame. Deer of all kinds abound very tame. Deer of all kinds abound throughout the country, and they are of use chiefly in providing sustenance for the

beasts of prey.

The rivs. are injested with crocodiles and alligators. Poisonous snakes abound, the most deadly being the Cobra da Capello the hooded cobra). Another dangerous reptile is the Russchan snake; specimens of this latter are usually carried about by the native showmen, who cause them to assume a position as it duncing whilst they charm them with music. Many of the snakes, however, are innocuous, and the dangerous ones are gradually receding before the march of civilisation, since the gov. offers a reward for every one which is killed.

The birds of I. are of the usual tropical rietles. The birds of prey include the varieties. The birds of prey include the vulture, the eagle (many specimens of which are to be found), and falcons of all kinds. Herons and kingtishers abound. and are much sought after on account of their plumage. Waterfowl are particularly numerous, and almost all the game birds found in Europe abound also in I., e.g., pigeons, partridges, quail, plover, and The jungle fowl of I. are supposed to be the ancestors of our domestic fowl. The supply of fish in sea, lake, and ny, is exceedingly abundant, and, indeed, forms

a very great proportion of the food of the poorer classes.

FLORA.—I. has no peculiar botanical features of its own. Its geographical position, however, as in many other research consents were the proportion of specis, causes its vegetation to be various and plentiful. Its products are those of the tropics and of the temperate zone. Rice has always been the staple product. The products of the tropical regions are tobacco, sugar cane, and spaces. Tea is grown on the slopes of the E. Himalayas, and has become one of the main products of 1. In Assam the tea plant is found growing wild. Coffee has been grown in the 5. parts of the peninsula, but with somewhat indifferent success. The chief trees what munerom successive the mango, orange, banvan and bamboo. The teak and various other trees useful for timber are produced in the more hilly dists., whilst on the slopes of the Himalayas are found the cedar, fir, and pine. But within recent times a Forestry Dept. was set up for times a forestry Dept. was set up for I., and the forests, which previously had suffered much owing to wanton destruction, are now more carefully preserved. The total area of forest land under the control of this dept. is above 160,000 sq. m. Of this total, 98,000 sq. m. are reserved and worked scientifically by the State. This forestry dept. has been taken over by the Indian Dominions (for. The most indigenous flower is the water-lify, and European flowers are found in the and European flowers are found in the greatest profusion at the present time.

The whole of the vegetation of I., however,

found in the prin, dists, which immediately border on the peninsula, i.e. of China, Persia, and Malaysta.

(ENSUS OF 1941.—The census of I. for 1931 gave a total pop. of 338,119,000, divided into 256,686,500 for the prov and 81,361,000 for states and agencies. The census of 1941 returned the total pop. us 388,997,955-an increase of nearly 50,000,000 in ten years—the pop. for the provs. being returned as 295,812,000 and for the states and agencies as 93,189,000. for the states and agencies as 9.3,189,000. Just over 19,500,000 people form the urb. pop. of L. and slightly less than 339,500,000 her rural pop. Thus the turb. pop. is to the rural approximately as 1:7. In all 1, there are 935 women to every 1000 men; in the Pumpb the igure is 847. To be set against this sections discrement is the estimated total of \$47. To be set against this actions discrepance is the estimated total of 9,000,000 widows, largely very young, debarred from remarriago by the stern decree of Hindu enstom. The this of a pop. of 5000 and upwards number 2703 and the vils. 655,000. For all 1, the density is 246 to the sq. m., in Bengal it is 779, which is far higher than that of Great Britain. Of the provis, Sind with 91 to the sq. m. has the least density of any provis. A city is a fri, with no 6 wer than 100,000 inhab. Of these there are 58 in India, and 23 of them are new, owing their rise to the development of ports and industry. By far the greatest number of this, and vils, come into the class with fewer than 500 inhab.—a fact which accounts for the slight density cass with tewer than 500 innot.—a fact which accounts for the slight density of pop. In the last lifty year, Calcutta (India), has trebled its pop.; Madracutta (India) and Bombay (India) have nearly doubled; and Lahore's (Pakistan) pop. has increased fourfold. The influence of the rise of industries and overseas trade on the growth of cities is seen in such places as Karachi (Pakistan), Jamshedpur (India), Ahmedab id (India), Trivandrum (Tra vancore), and Sholapur (India). Karachi had 98,000 linhab. fifty years ago; in 1941 if had 359,500. In the same period Jamshedpur, the seat of the Tata steel and iron works, increased from 5672 to 148,711; Ahmedabad from 144,151 to 591,267; Trivandrum from 27,887 to 128,36; and Shelapur from 61,91, to 212.620

Political Divisions .- The total area of I. may be divided into Provs. and Native States, and former Agencies (which were in political relations with the Indian Gov. and more or less under the control of Brit. officials). Reference to the present poli-tical orientation of the Indian states is made below.

The following tables give the provs., unions, and former states of the dominions

of India and Pakistan with area, total pop., and density per sq. m.; and the areas and pop. of the former agencies.

CITIES AND TOWNS.—The prin. oities of the Dominion of India, the Dominion of Pakistan, and other cities belonging to States are:

Dominson of India: Calcutta, 2,108,900; Bombay, 1,489,000; Madras, 777,500; Ahmedabad, 591,300 Delhi, 522,000;

Dominion of Pakistan I shore 671,600, ctil d is 'Iribes' including persons of Kirachi 39,000, Dater 21,200 Rawal the Annulst telagon and of this total pand 181,100, Multan 11,200 Silákot 77,0000 believe in magic and strive to 138,300 Peshawar, I 1,000 Silákot 70 peritrite impersonal forces. Unspeci the Malmis of Mohammedans who are in terms at a gent rate than the Hints are influenced by the customates who are the first are influenced by the customates than the contact of the customates and the customates the state of the customates are the customates and the customates are the customates and the customates are the customates ar sy em and other Hindu characteristics The oldest and most primary of all those religious is that of the Animist I rom the Animist to the Hindu is, however, a gir if step, the chief characteristics of the Hindu faith being the belief in a large number of gods, in the casto system, and in the cow as a sacred animal Buddhism, Jamism and the religion of the Sikis can be held to be almost offshoots of the original lindu faith, and in fact, other beliefs which can be held to differ far more than Buddhism from Hinduism are regarded simply as sects or off-hoots of the original Hindu faith Of recent years Dravidian type, United Provs and Bibar; the hostility between the Illindu and the

Moslem has sometimes seemed to be considerably on the decrease, but after the partition of India in 1947-48 there were formidable outbreaks of religious conflict especially in Binar and the Punjab. Whereas, however, there are innumerable sects and schisins amongst the believers. in the Hindu faith, there are but two seets amongst the Muslims—the Sunnis and the Shiahs. The Sunnis in I. are greatly in the majority. The original Moslein pop. was found amongst the Mongols and Pathan; who invaded I. a. conquering races, and even to the present time it is possible clearly to distinguish the descendants of these conquering races who were originally Moslem, from the converts of the conquered race who followed the faith of the conquerors less from religious convicion than from the desire to better their lot, and whose descendants since have become as fanatical as the des-cendants of their previous conquerors. The majority of Buddhists are found in Burma. Most of the Parsis are in Bombay (in 1941 there were 89,500); of Hombay (In 1941 there were 89,500); of the Sikhs over 3,000,000 are in Madras, Travencore, and Cochin. The Indean Christian pop. of Bombay is over 320,000; and there are some '''00 Jews there. In the Native States the totals (in 1931) were: Hindus, 61,467,000; Mushuns, 10,657,000; Buddhists, 94,000; Tribal, 2,501,000; Indian Christians, 2,430,000; Sikhs, 1,115,000; Jams, 799,000; Parsis, 13,000; and Jews, 3000.

HINDU PHILOSOPHY. The Indian mind, as is evident in Sanskrit literature.

as is evident in Sanskrit literature, is strongly disposed to metaphysical speculation, and this tendency may be seen in the old religious lyrics. In the later age the old religious lyrics. In the later age of the hynns the pantheistic idea becomes dominant and finds its outlet in cosmo-gonic speculation, becoming fully devel-oped in the Brahmana period. The fundamental conception of this doctrine is expressed in the two synonymous terms is expressed in the two synonymous terms brahman, originally 'power of growth,' then 'prayer' or 'devotional impulse,' and dimen, 'breath,' self.' soul.' The recognition of the e-sembal sameness of the individual souls conaneting all nike from the ultimate spiritual essence (parama-brahman) involved difficulties for a propulative minds, which turned for (parama-branman) involved directives for speculative minds, which turned for a solution of their problems to metempsychosis (aamadra), speculations which were not approved by the great body of Brahmans engaged in ritualistic practices. The body of treatises propounding the practices. the pantheistic doctrine, the Upanishads, were, later admitted into the sacred canon were, sitter admitted into the sacred canon as appendages to the ceremonal writings, the Brahmanus; and they thus form literally 'the end of the Veda,' the Vedasia, but their adherents claim this title for their doctrines in a figurative rather than a material sense, as 'the veda.' It is difficult to determine the time when the so-called Darsonas ('de-

orthodox as being consistent with the Vedic religion: Puru-mindimed and Uttera-mindined (Vedanta); Nankhau and Voya: Nyaya and Veus-shika—each pair being more closely related to each other than to the rest. See Jurther under Sankara; Sankiiva; Sanskrit Language and Literature; Yeda and Vedism; Ve-INTERATURE: VEHA BIR VENDON, VEHALA, OT L'PANISHAD; VISHNY; and YOGA. For the tenets of the two great anti-Brahmanical sects, the James and Buddhists, see under Jainsm; BUDDHA and BUDDHISM.

LANGUAGE.—Today the very speech of the people in L and Pakistan has become a matter of bitter communal dispute. Most of the peasants continue to talk the speech of their fathers but the literate mmority and politically-conscious in-dwellers and students argue about the rights and wrongs of the 'Hindu-Urdu controversy.' The sub-continent possesses hundreds of languages and also over 500 dialects; but when tribal idion and local variants have been eliminated, we have some to major or literary languages, some south, very different. But the Hindi-triu advocates can rightly claim that so far us the ordinary person, especially in the N., is concerned, the only common language is bazuar Hindustani—a pidgin torm of mixed High-Hindi and Urdu. which together constitute the same lan-guage written in different scripts, and compose the natural speech of nearly 250,000,000 people. This is also the interary language of 140,000,000 people, and the third largest language in the world. Unfortunately this bazaar Hindustam is a basic tongue, ill-adapted for the expression of ideas more complex than slimble direction and marketing. Meanwhile Eng. remains the normal language of communication between the better educated indians from all parts of the sub-continent in a very similar way to that in which Lat. in the Middle Ages was the lingua frence of the nobility and ecclessatics all over Europe. But just as the Lat. of the Middle Ages was far removed from the classical Lat. of the schools, so the Eng. of I. shows signs of the engine a very different tongue from the Eng. of England to-day. The difference is due to ignorance, historical cir-cumstance, and natural development. There remain, however, a large number of able Indians—business and professional men—who use Eng. with the greatest facility, but use words and forms of speech which sound unfamiliar to the contemporary Brit. car. The speed, and height of pitch and tempo in Indian speech in Fig. is its most constant quality, and the extreme form is found in Anglo-Indians (Eurasians), who all to the non-Celtic ear, seem to speak like Welshmen.

Some 225 languages are recorded in

Veda. It is difficult to determine the inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in Inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Darsonas ('de-inguistic surveys as vernacular in I. and tisse when the so-called Inguistic surveys as vernacular in I. and tisse when the so-called Inguistic surveys as vernacular in I. and I. and

GOVERNMENT AND CONSTITUTION.— The present govs. of I. and Pakistan are functioning under the Gov. of I. Act, 1935, but suitably adapted to meet the current needs. The framework of the new Consitution of I, has now been thoroughly discussed in the Union constituent committee of the Constituent Assembly and it is unlikely that there will be any major alterations in the draft Constitution between now and the time when the Constitution is estab. and operative. On the Constitution of Pakistan see Pakistan. The following is an analysis of the Constitution of the Union of I.

The Union of I. is, in spite of its name, a federation. The various governmental powers whether executive, legislative, or judicial, are distributed between the centre and the units of the federal union. The federation is, however, of the Canadian type rather than of the Amer. or Australian; the powers not allocated to the units belong as in Canada to the centre, whereas in the U.S.A. and Australia they remain with the units (see FEDERATION).
The executive head of the union is a President, elected by an electoral college consisting of all the elected members of the central legislature and of the various state legislatures. The votes are weighted so that the voting strength of the central legislature shall be the same as that of the state legislatures put together. The President's term is five years, but he is eligible for re-election. He can be removed by impeachment for rigilation of the Constitution. As in Britain, the president (like the king) is a constitutional head acting on the advice of ministers responsible to the legislature. The relations be-tween the President and his ministers are much the same as between the king and his ministers in Britain. There is a Parliament for the Union consisting of the President and of two Houses, the council of States and the House of the People. The council of States, or Upper House, consists of not more than 250 members. Each state sends one representative for every million of the pop. for the first 5,000,000, and one additional representative for every additional 2,000,000. The election is indirect through the state legislatures. permanent body not liable to disolution but one-third of the members retire overy second year. The House of the People, whose normal life will be five years, consists of not more than 500 members. Election is direct, and on the basis of adult There is to be not less than one suffrage. representative for every 750,000 of the pop. and not more than one for every 500,000. In previous constitutions there

(d) Gujarati, (e) Kashmiri (main dialect Kashtawari): (4) Pahari, divided into E., W., and Central; (5) The E. group: (a) Bengali, (b) Bihari, (c) Oriya, (d) Assamese; (6) S. India group: (a) Marathi, (b) Saurashtri, (c) Hindustani. For further details on the languages of I. see Indo-European Languages of I. see Covernment Languages of I. see Indo-European Languages of I. see Indo-Europ reserving seats for the Sikhs remains to be decided, and there is a feeling among certain sections that even the system of reserving seats for religious minorities is inconsistent with the idea of a secular state. But, whether these proposals are ultimately retained or not, the electorate will in all cases be joint. There is no special reservation of seats for Anglo-Indians, but the President may required. Indians, but the President may nominate not more than two members of the comminnity to the House of the People. bill, except a money bill, may originate in either House; it is to be passed by both Houses and assented to by the President before it can become law. If there is a conflict between the two Houses, the President must summon a joint session, and the bill, with such amendments, if any, as are agreed to by a majority of the manner of both Houses, but the president of the House had a such a summer of the House had a summer of house had a members of both Houses, is deemed to have been passed by both Houses. There is a special procedure for money bills.

The various subjects of legislation have been enumerated as exhaustively as possible in three lists: Last I. or the Union List, list II. or the State list, and List III. or the Concurrent List. Any Union law on a subject in the concurrent list overrides any State law on the same subject in the event of any conflict between the two. The Union List contains over 90 entries, including such subjects as defence, external affairs, citizenship, posts and telegraphs, railways, shipping, airways, broad-casing, and atomic energy. The State List contains about seventy entries and includes justice (excepting the Supreme Court), police, local gov., agriculture, public health, and education. The Concurrent List contains about forty entries. and includes such subjects as criminal law, criminal and civil procedure, marriage and divorce, contracts, trade unions, and welfare of labour. Residuary powers are allocated to the Centre. In circumstances requiring immediate action when Parliament is not in session, the President has a limited power to make Ordinances, which have the same effect as an Act of Parliament, but ningt be laid before both Houses as soon as Parliament meets. There are also provisions on emergencies. If the President is satisfied that a grave emergency exists, which threatens the security of I. by war or domestic violence, he may make a proclamation to that effect, and thereupon the Union Parliament is empowered to make laws even in respect of the matters enumerated in the State List. Although the Constitution is of the federal type, there is not a double chain of courts, one to administer federal law and the other to administer state laws. All the courts form a single hierarchy, at the head of which is the Supreme Court of the Union. Immediately below the Supreme Court are the State High Courts, and be-500,000. In previous constitutions there low them are the subordinate courts of were separate electorates for such minor-cach state. Every court in this chain titles as the Muslems, Sikhs, and Christians Will, subject to the usual pecuniary and This is now abolished, but seats are re-local limits, administer the whole law of

the country, whether made by the Paillament of the Union or by the State Legislatures. The Suprame (ourt has exclusive original jurisdiction in disputes be tween the gov of I and one or more states or between two or more states in the salso an appelate jurisdiction over the State High Courts in all cases involving questions of law as to the interpretation of the constitution and in certain other types of cases. Recadly speaking, its appellate jurisdiction corresponds to that exercised by the Prey Council of Britain before the Indian Independence at a came into force. It is further clothed with a special jurisdiction for the enforcement of the constitutional rights guaranteed by

the constitution Indian (n 1 serine - The service that carried on the work of governing India in the time of the Brit occupition. It also included the public works, forest, and telegraphy depts, though strictly these did not belong to the Indian Civil Service. The service was limited to about 1200 members appointed by the Secretary of State for India. Vacancies were filled by open competition every summer in England the examinat being the same as for Class I of the Civil Service of Phyland (later known as Administrative Gride) The successful endidates had to pass one or two vearastudy in England, and pass in examin ition in riding and an examination in the Indian Penal Code and Code of Criminal Procedure, the prin vernacular language of the provite which they were assigned, and the Indian Land Act in addition the optional subjects were lindu and Mohammedan Law, Sanskrit Arthu, Persian and Burnese The pay began it about £720 a year, and candidates could secure high positions as judges and administrators. After twenty five years of service a pension of not less than £1000 a year was given. Under the terms of Command Paper 7192 of Aug. 1947 mem bers of the Indian Civil Service were given the option of continuing to serve the gove of I and Pakistan or retiring with com pensation Pensions and compensation alike are paid under urangements made alike are paid under urangements made with the gove of I and Pakistan Of the 1200 officials of the service there were more Indian than Brit (629 Indian and 560 Brit in 1943) Many Brit civil servants are still serving in India or Pakistan See Sir E A H Blunt The Indian (1018 Service, 1947, also L > S O Malley, I he Indian Civil Service, 1401-1930, 1931

INDIAN LAW -- I he laws of Brit I are in nart universally applied and in past

INDIAN LAW -- lhe laws of Brit I are in part universally applied and in part applied only to certain classes. There is a right of appeal to the Privy Council in England, while high courts are held in the Provs of Madras, Bombay, Bengal, Agra, Bihar, Punjah, Central Provs, and Berar These courts had (1943) 14, 11 18, 11, 10, 11, and 6 judges, respectively, while the N.W. I rontice Province, Sind, Coorg, Almer-Morwars, and Baluchistan had judicial commissioners. The high court of Calcutta was up to 1948 the highest judicial authority for Assam, but in April of that year a separate high court was set up for Assam. In descending

order of authority are the courts of session for cruninal cases and the courts of magistrates (first, second, and third grade) For Delhi the high court of Labore was formerly the highest judicial authority, but there is now a high court at I ahore ee Pakistan) and also at karachi, and at Daces, bosides a judicial Commis-ioners court at Poshawa. In the lower civil courts each prove has acts and regu-lations peculiar to itself and usually a se sions judge presides or a distenuage with with iboiding pide and munsifs clow him. There are revenue courts resided over by revenue officers, and a below him number of small courts for trying minor (486) All cases I cit iming to family relations covering inheritance, marriage, left in, etc., we judged according to whether the princes are finding. Mostors, or I add that the criminal law, however, until 1347 was part of the Eng juris duction and some but in hes of the Hindu iaw had been prolibited by Eng law the laws of the Hindus and the Mo lems are both of religio is crigin The former is I rived from the Ve ia and its interpre tation the Vela itself being believed to be divinely in pired, but the date of the revelation and the person to whom it was revealed are unknown (See Indian Interature below). The main features of linder the person to the pers Hindu law are the rigid caste system and the inviolability of the family See CASTI Buddhist law is more secular and omits many of the cru ler regulations of omits many of the cru ler regulations of the Hindus with regard to women and the faulty. Mohon medan law is also religious in intent, as Mahomet is believed thave been divinct inspired. The Mchimmedan laws of inheritance prevail in Pakistan and in Muslim disks of the dominion of India, whereby all but a third of a person's projective is distributed out one that descendents in a manner present. an ong his descendants in a manner prescribed by the Koran The proportions of the distribution, however, vary accordng to whether the interpretation followed is that of Hanafa or of Share T. Hana itte code is the more previlent r India The civil judges and magistrates in Indian courts are mostly of Indian nationality, th ic in the higher purts also there is a luge proportion of Indian-

1 Dec visos. The sestem of education which crists in I at the present time owes utscustence entirely to the Brit Gov, but it has always been found to be most successful when, as fir as the natives are enterind in part lasses. There is provided in the arts are held in lombay. Bengal, tital Pross, and it (1943) 14, 11 tes, respectively, Province, Sind, and Baluchistan hers. The high importance of the interview of education in the own peculiar hierature, at a time when its future Europeand Baluchistan hers. The high court of indien literature and education in prot 1948 the for Assam, but the earlier decention in estitutions of E. Furope and W. Asia. The real imput us came from the missionaries, who had

studied the vernacular in order the more easily to continue their work, and who aimed also at the teaching of king, to the natives, in order that they might attain to the culture of the W. After a number of colleges had been estab. in I., the gov., after a long report had been made to them, estab. three univs. one at Calcutta, another at Madras, and a third at Bomhay. This was also accompanied by a scheme of local education which was, in principle, very thorough, and which extended throughout every prov. Schools receiving gov. aid were set up everywhere, and a properly graduated system of education which extended from the elementary school to the univ., was estab. A system of State Scholarships existed by which it was possible for a boy to pass from the vil. school to the univ. There were also state scholarships awarded by local govs. and by the Gov. of I., to enable the holders to study in the United Kingdom for two or more years. In recent years the desire for secondary education and a univ. course was, amongst a certain class, very great; but (1931) in the primary schools less than 5,000,000 attended out of a total pop. of nearly 340,000,000 (1931 census). Some remedial steps were taken and a permanent grant of nearly £4,000,000 was made annually for primary schools. Technical schools and industrial schools were set up all over the country. Engineering, veterinary, and agric, colleges have done much good work, and have been very largely attended.
The returns made in the census of 1931

are as follows:

Literate Illiterate 129,808,571 138,354,143 23,969,7.1 Males Females . 4.169,105

(these figures exclude per-ons aged 5 years (these nightest excitate persons aged 5 years or under and some 3,000,000 persons not enumerated by literacy). The census of 1911 shows a good increase of literates during the inter-census period 1931-11, the percentage of literates being 12.2 (1941) compared with fewer than 7 persons 1021 cent. in 1931.

The total expenditure on education in 1911-42 was £23,145,000 (or Rs. 3,086 lakha).

In the dominion of I. education is undergoing great expansion in accordance with plans for post-war development prepared by the Central Advisory Board of Educa-tion in 1944. It is estimated that these plans, which will modernise all branches of education, will take 10 years to com-plete. An All 1. Council for technical education has surveyed the needs of the country as a whole, and the Central Gov., in co-operation with the prov. govs, has sent abroad some 1400 scholars for higher technical training and research. Reorgan-isation of 54 existing technical institutions and the estab, of 160 others are contemplated in the prov. five-year plaus. Special provision is being made for the training of high-grade engineers and technologists; and the gov. proposes to estab. central higher technological institutes, at or near Calcutta, and Bombay, each with facilities for 2000 undergradu-

ates and 1000 post-graduates. (See also PARISTAN.)
There s

are nine univa.: Calcutta There are nine unive.: Calcutta (founded 1857), Madras (1857), Bombay (1857), Punjab (1882), Patna (1917), Nagpur (1923), Andhra (1927), Agra (1927), and Utkal (1943). There are also five unitary teaching and residential univs.: Allahabad (founded 1887), Lucknow (1920), Dacca (1921), Dolhi (1922), and Annamalai (1929); two denominational univs.—the Hindu Univ. at Benares (1916), and the Muslim Univ. at Aligarh (1920); and three univs. in Indian States—Mysore (1916), Hyderabad (Os-mania) (1918), and Trayancore (1937). At all the univs., except that in Hyderabad, teaching is mostly in Eng.; at the Osmania Univ. it is in Undu. In some provs., secondary and intermediate educa-tion is controlled by Boards; in 1942-43 there were seven of these Boards. Educational institutions are divided and des-cribed as 'recognised' and 'unrecognised.' according as they conform or otherwise to the standards prescribed by the Dept. of Public Instruction. There are approximately, in what was formerly Brit. 1., 219,200 'recognised' institutions with 13,258,000 scholars and 37,000 'unrecognised' with 701,000 scholars.

Broadcasting—All I. Radio is a Dopt, of the Central Gov. which controls broadcasting in 1. There are 9 stations and There are 15 transmitters in operation. also 7 receiving stations in operation at

Bombay, Calcutta, Delhi, Madras, Posh-awar, Dacca, and Trichy. SOCIAL CHANGES IN THE VILLAGE.

Various factors have made for changes in the Indian vil. in the last decade or twoeducation, a period of prosperity or adver-sity, the services supplied by the gov., the army, the motorbus, and the propinquity of a large tn. In the eyes of those who have known I. in the days of the Brit. Raj, the psychological changes at least seem at inst sight mostly for the worse. Many good judges think that litigation has increated; many comment on the increase of corruption, and some, as did Caudhi, deplore the growth of the acquisitive spirit; the spread of the communal virus is only too evident and hardly counterbalanced by the blind desire for freedom. This change has affected all the traditional torms of authority, and is tending to nar-tor the gulf, often still very wide, between these shove and those below. The Hindu villager's simost crazy fear of pollution at the hands of the untouchable is or has been matched by an almost superstitions reverence for the Brahmin. But as the untouchable becomes more human so does the Brahmin become less divine. In the Hindu vil. custe gives degree an added force. But the narrowing of the guif be-tween Brahmin and untouchable suggests that the force is weakening and that caste is relaxing its age old hold on Hindu secrety generally. The two tests are food and marriage. So much weaker now are the barriers due to food that amongst those who accept European ways of life inter-dining is universal, irrespective of caste or creed-though difficulties still remain

where the difference is of both caste and Marriage is a more serious affair. and till recently it presented an almost insuperable barrier to lovers divided by caste or croed. Mairiage is still not com-mon between Brahmin and non-Brahmin, or between followers of different creeds, but amongst the intelligents a the barrier is loss formidable. But in the vil. the food and marriage barriers are as strong as ever and communalism has done nothing to weaken them. The sanction behind caste is a religion so anet, and all embracing that any social change is difficult without its assent. On the purely without his assent. (In the pure) material side there are many changes for the better. The 300 per cent rise in prices which set in sharply in 1912 put more cash into the peasant's pocket than ever before and he wisely used it to pay his debts and redeen his land. For the first time for at least two generations debt was no longer a militone round the pea-sant's neck. Wherever the peasant is prosperous or the fle with the Army was strong change is evident in the sphere of habit and fashion. Thus in dress lighter materials have replaced the heavier mil-made cloth of homespun, silk has replaced cotton, heeled there any ereplaced slippers One gold carring is worn in place of many and the nose-ring and anklet have been renounced. In the house the brick floor is found to be cleaner than the old-fashioned floor of mud plaster. Furniture is more elaborate and cooking vessels more numerons. Some of the girls are even giving up the pictail for the modes of the W. Wiener, in fact, most of the new ways have their origin; as too, perhaps the slackening in religious observance.

Occupations of the Profit.—The great mass of the pop. of I. is occupied in agric, work. This is not to be wondered at in a country where the accidents of birth and bp. combine to make it difficult for the people to do anything other than follow the chosen occupation in a given place. Each Indian vil. is practically self-contained, and as far as possible the gov. provides that the land shall be held by peasant proprietors. The bulk of the pop. lives in the vils., and the caste system tends to crush any natural ambition which a native may have. Further, the differences of race and religion tend to make it difficult for any native to emigrate from place to place as his ambition dictates. The vast majority of the natives are contained in the vila, and are self-supporting. They engage in cattle and sheep breeding and the occupations of the country. material and the implements used are material and the implements used are saually manufactured by the natives in the vils. themselves. The present age has seen, however, a great change come over some parts of I. In the W., for example, large cotton factories have been set up, whilst the menuf. of jute is one of the staple industries of Calcutta. This has necessitated the founding of factories, and both industries have taken a strong hold of the natives. Other indigenous industries are silk-rearing and weaving, shawi and carpet weaving, wood-carving, and metal-working. In Assam and the lands

of the lower Himalayas many of the natives are engaged in tea-growing. Agriculture, however, atili remains, and probably will remain, the greatest of all the industries of I., its most important branch being the tea-industry, which employs about 1.000,000 workers. The development of the scaports and the increased demand have caused a great change to come over the I. that in pre-Brit. days exported only the spices, cottons, fabrics, and other luxuries which the W. demanded. Wheat and rice are exported nowadays in huge quantities; raw cotton, oil, seeds, raw jute, tea, oplum, hides, and indigo are amongst the next most important of all the exports of I, to which can be added manufactured cotton goods, hardware, machinery, lothing, and coal Through the initiative of Lord Limithgow, an E. Group Supply Council was formed during the second World War for the supply by various Empire countries of munitions to the imperial forces in N. Africa, the Middle E, Malaya, and elsewhere. This great scheme of making munitions E. of Suez was based on I. which country thus had an opportunity of securing a large where of malactured extends.

Agriculture.—The total number of the pop. supported by agriculture, including forestry and the raising of ivestock, was secording to the culsus of 1931 about 110 m. In every prov. there is a dept. of agriculture. There are staffs of experts and a central staff, with a fully-equipped central station, research institute, and college for post-graduate training of private students and of those who have completed the agric. course in prov. colleges; a civil dopt., veterinary dept. for the prevention and cure of cattle discuses, and a dairy research institute. Following the recommendations of the Royal Commission on Agriculture, an imperial council of agric, research was set up by the tiov. of L. with the object of promoting agric. and veterinary research throughout L. The production and introduction of improved strains of crops is still the chief feature of the work of agric, depts. although progress in other directions is now evident.

The chief crops and the production in the year 1943-44 were as follows:

Crop	Acres soun	Pield (tona)
Rice	81.117.000	30,664,000
Wheat .	33,961,000	9,741,000
Sugar-cane .	4,231,000	5,848,000
Tea	837,200	1573,773,600
Cotton .	17,427,000	3,626,000
lute	701,000	1.541.000
Linseed .	3,553,000	381.000
Rape and		
Mustard .	5,361.000	921.000
resimum .	4,119,000	447,000
Castor seed .	1,543,000	140.000
Ground-nut	9,808,000	3,823,000
Coffee .	198.000	17.000
Rubber .	144,500	136,684,000

¹ Yields of tea and rubber are given in 1b
2 Cotton and jute in bales of 400 lb.

The following table shows crop estimates (1947-48) for the dominion of I.:

Crop	Area (acres)	Field (tons)
Wheat .	20,207,000	5,316,000
Ruce	59,650,000	18,760,000
Sesamum .	3,701,000	333,000
Cotton .	10,932,000	12,116 000
Rape and		•
Mustard	4.389.000	782,000
Linseed	3,338,000	364,000
Ground-nuts	9,974,000	3,454,000
Maizo .	7,750,000	2,111,000
	1 Bales	

great effort, it is hoped, will yield another 2,000,000 tons of food a year.

The livestock consus in Brit. I. (excluding the United Provs. and Orissa) for 1940 is the most recent available: Cattle, 87,674,800; buffaloes, 22,115,500; sheep, 25,183,000; goats, 30,212,000; horses and pomes, 1,000,900; mules, 40,270; donkeys, 1,1,7,100; camels, 42,600; pigs, 105,100; nultry, 61,128,300 1,955,400 poultry, 61,128,300

The lands under the control of the provent dept. are classified as 'reserved forests dept. are classified as 'reserved forests' (forests intended to be perma-nently maintained for the supply of timber Great benefits have accrued from irrigation, the development of which began a 'protected forests' and 'unclassed'

Indun State Radams

century or more ago under Brit. engineers. In the past two decades the Lloyd Barrage (Sukkur) and canals (Sind), the Sutlej Valley and Haveli schemes (Punjab), the Sarda Canal (United Provs.), and the Mettur Dam (Madras) projects have been successfully completed, and a sixth canal, the Thal, is being constructed. The total area under irrigation is nearly 60,000,000

For centuries L's primitive, wasteful farming methods have left her vast pop. at the merry of recurrent famine. The Indian Gov. plans to reclaim six million

forest land. Reserved forests cover about 72,000 sq m. (Central Provs., 19,422 sq. 72,000 8q m. (Central Fraves, 19,722 sq. m.); Madras, 15,620 8q. m., Bombay, 10,23 sq. m., Bengal, 6,935 sq. m., Assam, 6,680 sq. m., United Provs., 5,213 sq. m. Protected forests cover 6,569 sq. m., and 'unclassed' 16,630 sq. m. Total name of forests, 92,157 sq. m. Total area of forests, 95,157 sq. m.

Minerals.—The chief minerals are coal and petroleum. The Damodar Valley in Bihar and Bengal contains the greater part of the coal resources of I., and in quality it is suitable for industrial developat the mery of recurrent famine. The quality this intable for industrial developments from the plane to reclaim six million ment. In 1938 the output of coal was own food. This acreage represents ten per cent of the cultivable land now lying idle and it is planned to reclaim the six million acres within seven years, while (2,743,675 tons), saltpetre, (148,824 cwt.), 4000 tube wells are to be sunk at an outlay of £205,000,000, which will in time be more than recovered from the soil. This illinenite are increasing in importance.

Manufactures.—The chief indigenous in 1941-42 was over 10,000,000. The dustry, after agriculture, is the weaving production of yarn in that year was cotton cloths. Other important indiindustry, after agriculture, is the weaving of cotton cloths. Other important indi-genous industries are silk-rearing and genous industries are slik-rearing anowaving, shawl and carpet weaving, wood-carving, and metal working. These are mostly surviving anet. vil. handicrafts In 1939 there were 10,100 factories subject to the Indian Factories Act, employ ing 1,751,137 persons (including 239,414 women and 9403 children) (no child may be employed for more than 30 hrs. a week). There were in the same year 420 cotton mills in I., including the Indian states, mostly in Bombas and Ahmedabad. In 1939-40 production was 1235 million lbs of yarn and 878 million lbs. of woven goods. Excluding Indian states and gov. factories there were in 1939-40: 106 jute mills (mostly in or near Calcutta). 110 rice mills, 58 tanneries, 150 tile and brick factories, 16 shipbuilding yards or workshops, 1000 tea factories, 110 foundries, 19 fron and steel smelting and steel ace, we from and steel smelting and steel rolling mills, 266 sugar factories, 293 oil mills, 112 motor and coach-building works, 163 tobacco factories, 16 paper mills, 6 breweries, 20 lao factories and 108 silk mills.

The latest available statistics (1949) of mills, factories etc., are given as follows for I. as a whole, but excluding Indian States

and gov. factories -

FINANCE.—By the system of decentralised finance initiated by Lord Mayo in 1870 the Central Gov. assigns to the prov. govs. a fixed share of the revenue collected by them under specified heads. result of the Montagu-Chelmsford reforms the finances of the Central Gov. and those of the provs. were almost completely separated, the provs. retaining all income from land revenue, irrigation, excise, stamps etc., while the Central Gov. had the income from communications and income tax. On the introduction in 1937 of prov. autonomy, there was a further change, and from April 1 of that year the proves, have had a definite share of the proceeds of income tax; and a prescribed share of the proceeds of the excise duty on jute is assigned to the jute-producing provs. Some of the prov. govs. receive ann grants-in-aid from the Central Gov. and a share of the additional duty on imported alt. The Central Gov. bears all expenditure on defence while the prove are responsible for the charges of their own services and also for expenditure on famines. The prove, govs frame their own budgets, can raise loans and impose additional taxation.

Land revenue is the oldest and the most important source of revenue. It is levied according to an assessment on estates or Bihar, and Ort sa, and in Some dists, of Madras, and in Agra and Oudh, the assessment was fixed permanently at the end of the eighteenth century, while it is fixed periodically at intervals of from 12 years to 40 years over the rest of I. The gross land revenue in 1943-44 was nearly £23,000,000. Opium is a declining, though still large, source of revenue. In former Brit. ter. the cultivation of the puppy for opium is confined to the United Prove , though owing to war requirements, the area under poppy was increased there. Opinm is also produced under special supervision in the Central Indian. Rajutana, and Gwallor States; and it is bought in its crude state by the gov. at the darace. In 1926 the Gov. of I. announced its intention to restrict export south for medium languages and over the control of the control of the control of the control opinion opinion opinion of the control opinion opini except for medicinal purposes and exports to foreign countries coased at the end of 1935. The gross revonue in 1943-11 was about £600,000.

The first budget (dominion of I.) presented to the Dominion Constituent Sambly (Feb. 1948) showed a total denert of Rs. 268.5 million (£20*) million. After a contribution of Rs. 45 million from the rallway surplus and new taxes the remaining deficit of Rs. 100 million (£7.5 million) was covered by taking direct to reve ue the advance payments building 117 8,000 direct to reve ue the advance payments of corporation as, leaving a final deficit Paper mills 17 10,000 Lac factories 22 2,300 Silk mills 112 5,500 With regard to cotton spinning and weaving, the number of spindles in all I. heads: customs, \$1.75; central excise, Value, in

On the basis of the trade returns for 1944-45, 6, 34 per cent of Indian exports went to the United Kingdom and other parts of the Brit. Empire, and 34 68 to bereign countries. The United Kingdom took 29.24 per cent of these exports,

Ceylon, 9 08 per cent, Australia and New Zealand, 8 60 per cent; and the United States of America, 21 22 per cent. Brit. unports accounted for only 38-81 per cent of the total imports as against 61 19 per cent for ioreign countries. The 61 19 per cent for torsign countries. The Inited Kingdom sent 19 99 per cent of the total imports and Australia and New Yealand 11 per cent; while the United States sent 25 17 per cent, Persua 21-53 per cent, and Egypt 8 65 per cent. The total imports into the United Kingdom from 1 in 1945 were valued at 466,410,000 and expects to India from the United and exports to India from the United Kingdom were \$33,151,000.

In 1939-39 the number of ships engaged in the foreign trade which entered and cleared with cargoes at ports in Brit. I. was 7140, with a tonnage of 19,091,691, nearly 70 per cent of which was under the Brit flag The tonnage of vessels which Isrt flag. The tonnage of vessels which ontered with cargoes in the interportal trade of I was 13,764,794 tons in 1949-40 and cleared 13,517,322 tons. The number and tonnage of vessels built or first registered at Indian ports for 5 years, 1936 10 was as follows built, 213, registered, 284; tonnage 8996 and 35,970

respectively.

CURRENCY .- The monetary unit of I. is the Indian Rupee, the sterling equiva-lent of which is 14 6d. The coins in circulation are: silve, 1 rupre, equivalent to 16 annas; 1 rupee or 5 anna piece; 1 rupee or 4 anna piece; nickel, 1, 1, 2 and 4 anna pieces; bronze, 1 piece equivalent to Jamin, I pice equivalent to Jamina; I pice equivalent to Jamina; I pice equivalent to Jamina; I pice of pice. The paper currency consists of Peserve Bank notes in denominations of Rupees 2, 5, 10, 50, 100, 500, 1000, and 10,000 A 100,000 rupees is called a lakh and is written thus: Rs 1,00,000; and one hundred lakes is called a crore and written. Rs. 1,00,00,000. A lake of rupees when the rupee is 1s. 6d. is equivalent to £7500.

COMMUNICATIONS—The development of the communications of I have had a very marked effect upon the increase of trade. The improved system of roads, the increased use of the natural and artiherd waterways, and the building of good and reliable railways have been of the greatest importance to industrial I. The great the are linked together by good roads which are utilised for short distance traffic and even for places some hundreds of unles distant. The rive, especially the Ganges, the Brahmaputra, and the Ira-wad, are used by the natives to take the produce of the interior to the scaports. whilst the canals also are well utilised.

Raduons - The most important development of all, however, is that of the railways I and Cevion are connected by All the combined ral and steamer ferry large this, are linked up together, this having been done by means of good trunk are now used for purposes, and they are now used for purposes of trade. Every dist. of I is served by a railway, and the thinly populated dista. have specially narrow-gauge light railways. Nearly 700,000 men are employed, and the whole system was thoroughly overhauled before the First World War and linked up

properly. Before partition, almost the whole of the Indian railway system was owned and worked by the Central Gov. There were some lines of minor import-There were some lines of minor importance owned by companies, some of which were operated by their owners and some by the Gov. There were also lines in which Indian states and dist. boards were interested. The mileage open for traffic (on March 31, 1945) was 40,509—about 50 per cent on the standard gauge (5½ ft.) and 42 per cent on the metre gauge. The net carnings of the railways in 1944-45 were about \$62,865,000 and the contribution paid from railways to general revenues was £24,000,000. On Aug. 15, 1947, 10,524 m. of railway were divided into two portions: 6659 m. of line in Stud, N.W. Frontier Prov., W. Punjab, and E. Bengal were allotted to Pakistan, and the rest, comprising 33,865 route m., to I. rest, comprising 33,865 route m., to I. Locomotives were so divided as to ensure Locomotives were so divided as to ensure that each section had the type suited to its operational requirements. About 73,000 employees operated for Indian Railways after partition. At the end of 1910-41 there were over 102,000 m. of telegraph line carrying 528,000 m. of wire and 1500 m. of rible There are over 9200 telegraph one step over 9100 telegraph one section for paid traffic in I. and over 24,000 post offices in the country. After 1947 there were twenty-three civil aviation companies with an authorised cap, of Rs. 42.2 crores. Air services were operated in 1947-18 on

services and forty-two weekly. The wireless stations, maintained by the Indian Posts and Telegraphs Dept., numbered twenty in 1940, of which five were coast stations available for general public correspondence and the remainder inland. The same dept. operates the telephone system, though exchanges have also been estab in Calcutta, Bombay, Madras, Karachi, and Almedahad by

twenty-two routes covering 13,295 route in, by eight transport undertakings using 166 aircrew personnal. M. flown were 4,648,000, and traffic carried, eight million

tons. The number of passengers flown was 136,800. There were sixteen daily

companies under gov. licence.

Ports,—The chief seuports are Bombay. Calcutta, Karachi, and Madras; lesser ports are Port Blair (Andanans), Calicut, and Trivandrum (Madras), and Surat

DEPENCE. - The partition of I, involved a div. of the armed forces between the two dominions on a territorial basis, and the result was a div. in the proportion of one-third to Pakistan and two-thirds to I. The anned forces of I. formerly contained a substantial Brit. element, but I. decided to nationalise her armed forces and only a small number of Brit. officers, mostly of the technical and specialist arms. mostly of the technical and specialist arms, were retained. After partition, regiments and formations of the Indian army, which for many years had consisted of sub-unit-comprising men of various castes and creeds had to be reorganised into regiments.

reduction in the strength of the Indian and reduction in the strength of the Indian and Pakistan armies amounted to 1,648,772 men and women. Of these 32,677 were Brit. and Indian Pakistan officers, 12,177 were officers and auxiliaries of the WAC (I), 49,024 were Brit. other ranks serving with Indian and Pakistan armies, and 1,335,570 were Indian and Pakistan ranks, including 64,321 civillans attached to the two armies. A total of 8668 army units were dishanded, sixty-one Indian units were dishanded, sixty-one Indian units were disbanded, sixty-one Indian State Forces units returned to the States. State Forces units returned to the States, and cleven Nepalesse contingent units returned to Nepal. The old Indian Army prior to Aug. 1947, was divided into three Commands—Northern, Southern, and kastern. A fourth, Central Command, was raised during the war and dishanded when it was over. Of the Indian divs. which took part in the war eleven were dishanded, leaving three infantry divs., one armoured div., and one airborne div. On Aug. 15, 1947, the army was divided into the Indian Army and the Pakistan Army. The N. Command was allotted to l'akistan and the S. and E. Commends to I. A new Command, Dethi and E. Punjab Command, was formed soon after Punjab Command, was formed soon after-ward. There has also been a considerable expansion of transport services. Other additions to the services were tank trun-porters, amphibians and sev. water transport companies. The army of Pakistan comprises six armoured corps units, eight and a half artillery regiments and thirty-four engineer units. Most in-fantry regiments of the old Indian Army with a Muslim majority were allotted to Pakistan after partition.

The Royal Indian Navy traces its hist. unmerruptedly from the early seven-teenth century when the F. India Com-pant's Marine was formed. Formerly styled the Royal Indian Marine, the service was reorganised between the two world wars on a combatant basis. In 1928 it hoisted the White Ensign for the first time and in 1934, following the passing of the Indian Naval Discrime Act, was redesignated the Royal Indian Navy. As a result of partition the navy was divided between the two Dominions. To divided between the two Dominions. To 1. went 4 modern shops 2 frigates, 1 corvette, 12 minesweepers, 4 trawiers, a survey ship, and some auxiliary vessels, with a personnel of self-of whom about torty-live are Brit.) officers and 5500 rangs. Indianisation of the navy will be completed in 15 years. A large naval estab is being constructed in Cochin (ii M.I.S. Venduruthy) which will include specialist training facilities in gunnery, communications, n wigation, torpedo, initsubmarine, cleatrical, and radar branches. The Pakestan navy consists of two sloops, two frigates, four minesuccepers, two trawlers, two motor mine-

launches.

The Royal adian Air Force had its inception in the recommendations of the for many years mad consisted of sno-units inception in the recommendations of the comprising men of various castes and skeene Committee in 1926, and in 1932 creeds had to be reorganised into regiments the Indian Legislature passed the Indian containing only representatives of their in Force Act, the first flight being formed own dominion. From the end of the ithe following year. In 1946 it consecond World War to Aug. 1947, the not sisted of nine fighter and two transport squadrons with modern aircraft. On partition seven fighter squadrons and one transport squadron were allotted to I., and two fighter squadrons to l'akistan.

Indian Army (1857-1917). After the Mutiny of 1857, and when the Indian empire was taken over by the crown, it was decided that the European army in I. should be analgamated with that of the drawn Formula in the days of the the crown. Formerly, in the days of the E. India Company's control, the army was organised on a presidential basis, a staff organised on a presidential basis, a vitil oorps being formed in 1861 for each of the Presidencies. This system for a time worked well, but finally the old presidential system of organisation was done away with, and the whole Indian Army was reorganised under the command of a single commander-in-chief. The staff corps became the staff of the Indian Army, and the basis of organisation was one N. and one S. command, together with a separate command for Burma, all under the control of a commander-in-chief of the Indian Army. Previous to this, and during the gov. of Lord Dufferin, the incident usually known as the Penjdeh scare (over the Russian occupation of that and another place in Afghanistan) took place, and led incidentally to the formation of the Imperial Service Corps. princes of I. volunteered to give pecuniary aid to the gov.; this was at the time rejected, but they were later informed that a proposal to place a certain number of native troops in each state at the disposal of the gov., to be trained, drilled, and officered by Brit. officers, would be welcomed. This was done, and gave rise to the Imperial Service troops, whose value and efficiency were tested and proved. In 1939 the defence forces of I. comprised In 1939 the defence forces of I. comprised units of the Brit. Regular Army (60,000), the Indian Native Army (140,000), the Indian State forces (about 35,000), the Auxiliary Force (about 24,000), and the Territorial Force (18,000) For police duties and frontier service the regular military was supplemented by frontier militiar and local levies The military forces were organised as the N., S., E., and W. Commands, and the Burma Independent Dist., there being a number of pendent Dist., there being a number of dists. and independent brigades in each command. The Field Army was organised in four divs, and five cavalry brigades. The Brit. Regular Army in I was paid by the Indian Exchequer and was organised in divs. and brigades with the Indian (Native) Army in the proportion of one Brit to three Indian battalions. The Artillery Corps at this time was 13,000 strong, organised into one field and six mt. regiments besides various small units—altogether a score of pack batteries and a number of field and garrison artillery batteries, the latter with a proportion of Indian drivers. The tank corps units

Territorial Army of Britain, was intended to be a second line replica of the regular army in time of war. The Indian State army in time of war. The indian State forces were raised and maintained by the Indian States and trained under the supervision of Brit. officers. In the native army the composition of the regiments was very varied indeed. The troops constituted was very varied indeed. sisted of then of all races and religions, and these varied naturally with the position of the command. In the ranks of the native army in I. were found Pathans, Sikhs, Punjabis, Mahrattas, Hindus, Gurkhas, together with representatives from almost every race to be found in I. The terms of enlistment were general, and although the native troops had not, up to 1939, ordinarily served overseas, nevertheless they enlisted for service within or without the Brit. empire, and could be or without the Brit. empire, and could be taken over-cas if necessary During the First World War, 1,215,000 officers and men of the Indian Army were sent on service overseas from I., the number of Indian troops being 570,000. The total Indian casualties were over 158,000 (deaths, 73,132; wounded, 84,715). Between the world wars some native units served in Iraq and at colonial stations, their pountagement below determed by the their maintenance being defrayed by the Brit exchequer. The intantry and cavalry of the old Indian Army were organised into double companies, each commanded by a Brit, officer, together with a Brit, junior officer. The native officers, risaldars in the cavalry and subandars in the infantry, issued all orders to the native troops. The senior officer was called the risaldar-major, whilst to each half company was usually attached a junior native officer, who was called a jamadar. A reorganisation of the Indian Army was begun in 1921 to meet defects brought to light in the 1911-18 world war. This consisted of grouping regi-ments for training purposes, and in 1922 the system was carried a stage further by converting the groups into regiments in the case of the Indian infantry and Pioneers. The chief reform, however, was that of 'Indianisation,' i.e. having units officered entirely by Indians and without any Brit. cadres. The Indian Territorial Army was also Indianised (see Territorial Army was also Indianised (see The Army in India and its Evolution, 1924, Issued under the authority of the Gov. of I.). In the Second World War the Indian Army fought in Burma, N. Africa, Italy and the Middle E., winning over 5000 awards including thirty-one V.C.'s—an Empire record surpassed only by the Army of the United Kingdom. Exclusively recruited on a voluntary basis, the strength of the Indian Army at its peak strength of the Indian Army at its peak was 2,250,000, a feature of this expansion being that of the Royal Indian Artillery, which was increased to \$1,000 all ranks, and consisted of twelve int., eleven field, seven anti-tank, two medium and twentyconsisted exclusively of Brit, personnel, nine anti-fank, two medium and twenty-free was organised in 1920 as a second line to the permanent partison, and was formed by voluntary enlistment of men of Brit. extraction.

The Territorial Force, also organised in 1920, was a militia force, and, like the missing, 11,754; wounded, 64,351; and 79 189 prisoners of war, chiefly on the Burmese front) By Sept 30, 1946, in the process of demobilisation over a million men had left the service the ultimate peace time strength of which had not been finally determined when the partition of I consequent on independence involved the complete reorganisation of the armed forces of I and also the dis

appearance of the old Indian Army
Royal Indian Navy—In 1926 it was
decided to establish a Reyal Indian Navy on a combatant basis the nucleus of which was to be provided by the former Royal India Marine. This navy at the close of the Secont World War, included six modern slops, three frigates, two corvettes sixteen minesweepers a survey areal and six modern slops. vessel and six modern traveles There were also a number of auxiliary vessels In 1946 navel strength was reduced by demobilisation to 1000 efficers and 10 000 ratings It was decried in the same year

ratings It was defined in the sum of the to purchase three causers from the Royal Navy for the Royal Indian Navy Rigal for I re of India — Had its beginnings in the Indian Air Force Act (1932) the first flight being formed at karschi in 1933 March 12 1941 the King approved the design thon of Poyal n recognition of the wat services of the force. In 1946 it consisted of eight fighter and two transport squadrons with modern aircraft I or the division of all the armed forces on the partition of the

The Indian Princes (before the Pirition of India)—The Indian States numbered 62 of which 327 were relatively of very little consequence and only existed inde-pendently as the result of a historical acci-dent. The chiefs on the Afghan frontur acin a different cat gory compared with the Princes of I all being Mosleins with a piliteal grivitation towards Kabul and not to Delhi and as regards their internal administration they were to all intents and purposes independent. There are only seven of these border States vary ing in important fr in that of the khan of kalat with a will is darid int country of 75,000 a m in Baluchistan and a pop of 305,000 to the small state of Phulera on the Hazara border with an are t of old a m I wo of the chiefe the Mehtar of Chitral and the Kh in of Kalat, have the title of His His bics and a silute of guns. One of the most important is the new state of Swat founded in cem his new hour of swat founded in the practively recent years by a descendant of Ahkhun I of Swat on the Peshawar border. Nepal is an independent state but it is not and never has been an Indian state From the mt mass of the Pannis and Karakotam in the N where political I imping a on central Asia to Cape comorin in the S a distance of 2000 m it was possible to travel almost entirely Implinate on central Asia to Cape in the surge of Valsin invasion I maded comorn in the 9 a distance of 2000 m it was possible to travel almost entirely through ter of the Indian princes without to their fauth. But although the touching Brit I from Chitral (which was a Brit Protectorate) one would pass through Gligit a dependency of Kashmir, thence the route would lie through small Rajput States in the Himalayas, past Simla to the Sikh State of Patisla in the medials prevailed until Clive's victory at Plussey in 17.7 for the first four Punjab plains, a country of prosperous at Plasecy in 17:7

vils and stalwart fighting men, thence vills and status in guiding men, thouse to the devert of Rajputana home of the blue blooded Rajputs and memories of ant chivally, then on to the sphere of the Marahas in Baroda and Indore secular rivals of the Rajputs Thence into the great Muslim state of Hyderabad and Indore the Classe Britain and then e mal in area to Great Britain and then to livancore with its unrivalled beauty of for at lands and lagoons, and so to the Conorin, fabled abode of the god der Kumari In all the Indian states court desone two fifths of the whole of I and contained more than one fifth of the pop Their subjects were Bit pro tected persons, not Brit subjects, and they were governed by hereditary rulers under the surcrainty of the Brit Crown In the administration of internal affairs the authority of the Princes was limited by truty relationships with the Para mount Power (Britain) and by usage and sufference Brit Indian law did not privail nor could the Central Indian legislature legislate for them The Prin cs had no relations, however with the Stat wate now either nierged in Provs of I r lakistan or have been integrated in groups or unions so that very few preserve their old identity

he manner of evolution of this type of auton mous or semi autonomous lingdom is a problem the solution of which is luried in antiquity. Originating in Hindu plitical theory it has certainly been in it an ed by the Brahmine il caste system which is at least 3000 years old. This is me of life harmonised best with a government of the case in the case. in which the ruler administered a small ter with the assistance of a durbar or comil of ministers priests military fuditories and representatives of the at or guild. This durbar rule is best f uditories and the durbar rule is ossillutrited in the more and Rapput ates of Central I and the couse of the grid Indian Desert some of these being the illing origin. States ille the Rapput to illing origin. tri malities and some of the lier states in the -- Mysore Iravaneers and Cochin - wed their centimics of existence to the il support of their nobles and peasantry i is up or to the cooler and peasantry i obtain a clear view of it position of that ites in the political fabric of I of the last they must be seen in historical I is tive. The long drawn tragedy of its is in the crash of empires and king of the bitten us of clipices and king of the bitten us of religious feuds, are ricted in the evolution of I's minor lightns' (Sir Wm Barton) Hindu I in the touth to eleventh centuries was friends out to a point in having found

w defenders in the age of terror that was thin impending. But for the Rapputs the lumin would probably have been lost in the surge of Musica invasion | Unaided I or the first four

centuries of Muslim rule the chief opponents, the Rajputs, short of man power, could not for long keep the hold. Refusing, however, to admit defeat, they fled to the oasis of Rajputana, into the tistnesses of the central plateau. No of the Yindhiyas and to the peninsula of Kithi war, and there they set up small kingdoms most of which late became fiels of the great Mogal Empire. On the central plateau many of the smaller Rajput barons, however became fendatories of the Muslim kingdom of Malva. The resist ance of the Rajput rules preserved the culture traditions, and religion of the Arvan age. Most of them have survived the storms of conturns and form the bulk of the Indian States of to day proving the vitality of the point al systen they are

body (see Sir van India, 1934)
The rulers of Indian States have not necessarily any religious or tribal con nection with the majority of their ub-jects, thus, the Nizam of Hyderabad is a Moslem, yet most of his subjects are Hindus. The salutes accorded the Princes indicated their relative import ance Princes with a salute of eleven guns and more were addressed as His Highness Yet some well known Indians of title, such as H H the Aga khan (q 1) and the late Mah reach of Burdwan, are not ruling chicis. The (hamber of Princes was estab in heb 1921 as a permanent consultative body on matters affecting the State generally, or both them and Brit I, or the kimpire as a whole In 1947 it consisted of over 100 rulers of States who were members de jure, and twelve rulers elected by 127 Arising out of the Montagu other States Chelmsford reforms most of the states were in direct relations with the Gov of I In recent years the policy was pursued of promoting co operation in such matter, as justice, police, and public health. In 1943 an extensive scheme was launched for improving the administrations of hundreds of petty States in W I by attaching them to large neighbouring states such as Nawanagar and Baroda

Nawanagar and Bardoa
History — In a country of the orea
the pop, and the diversity of language and
race such as I, not unnaturally but he
comes a matter of some complexity and
difficulty, and it is only with the widest
movements that this sketch of the hist of
L, is concerned Indian hist, for all
practical purposes, because with the first
invasion of I by the Arvins, who came
from the VW and who inted for some
time on the slopes of the Himalavas
before they finally entered the great Indo
Gangetic plain and drove back the
Dravidian pop into the real pennsula to
the S These invaders had a settled
system of civilisation and a fixed religious
system They were well acquainted with
the various arts, and above all they
brought with them the Ing Veda, the
Hindu hymnal that estab, the antiquity
of their origin (see also Religiou above and
INDIAN LITTERITURE and ART, below).
They formed states in the great plain, and
they built great thus., the sites of many

of these remain down to the present day $(e \ q)$, Benares, Aryan Baranesi) Phoir social system divided them definitely into four divs the Bighmuns, or the priests, the Kahatrigas, or nobles the Varsigas, almost the modern middle class, and the sudris, or self class composed principally of non Arvan peoples who were the slaves of their conquerors. Gradually the civili or their conquerors. Common the frains stinn and the religion of this people became corrupted and about the year 500 B c three h cd the great reformed Buddha (t).) At the same time occurred the rise of Jamisin, a religion which was a family by the bary table to the bary table process. founded by Vudhamana Mahavan, and has often been regarded as an off shoot of Bu ichism But Buddhism never super sede I at rely the older futh of the Hindu, the fight man which had been intro-duced with the coming of the Aryans and although for a time Buddhi m appeared atthough for time random in appeared to have gained the upper hand, ultimately the original religion became the more prominent. It is with the invasion of Alexan let the Great (2n) that the real hist of I with relation to the outside world may be said to begin Alexander's campuch was confined however to the Punj ib and to Sind and ofth meh he made no d inite settlement we know that he planted cities and left (k garrisons behind him. On his death I passed to Selicus Chandragupia I mperor of I F of the Indus was contemporary with Selicus I he two I mprove made an alliance, and for a time the relations between the Gk and the native kingdons were well estab

As it ords grow more certain and contin icus, they tell of periods in which great indian dynasties acquired power over a large part of I Thus, there are the Maniya I mpire (r 321-184 Bc) with Chindragupta and Asoka as its out standing rules and there is the Gupta I mpire (c Ap 120-500) the golden age of Hindu culture. But none of these I manifest standing over the whole of I I mputs extended over the whole of I, and beyond their borders princes and chicfinns powerful and weak were in constant rivalry and stiffe. Our know-ledge of the system of goy of Chandraguitt is due to the fact that the ambas sort to his court by belongus, Megas-theme, wrote an account of the court, go, and multitudes of I. The grand-on of this great king was 1saka the champion of Buddhism I rom the inscriptions and rock edicts which Asoka caused to be plus d throughout his emplie we learn that he ruled practically the whole of I with the exception of the extreme 4 of the peninsula During his roign Buddhism be and the predominant religion but after his death, the emple began to decay, and mar the beginning of the second cen-tury nor the Maury as dynasty came to an end I wo other dynastics may be here noticed the Sunga and the Andhra, but of neither is very much definitely known. The Gk provinces of I had in the meantime become independent kingdoms under Gk rulers, and in the middle of the second century a c the W Punjub became for a time part of the Parthian empire

In the middle of the second century

B.C., tribes from Central Asia began to myode I. The first of these was known as the Sakas, who estab. themselves W. of kandahar, and gave to the country the name of Sakastan. Another was the Kushan, and in the first century A.i. the chief of this tribe estab. a great kingdom in the N.W. of 1. The empire of the Kushans does not seem to have come to an end until the beginning of the fourth century of the Christian era, when the Gupta dynasty was catab,, and almost immediately began to prosper. It was founded by a second Chandragupta, who extended his kingdom along the valley of the Ganges, and was increased by his sou, Samudrigupta, who conquered all the provs. of the (larges, and estab, lamself in Southern I, as well. Under Chandra-gupta II, tresh additions were made to the empire, but finally, about the year 480, the Huns from Central Asia broke up the empire and estab. then selves in Northern L. But at the beginning of the sixth century. the Huns were beaten by a Gupte king. The last native prince of Northern I. was Harsha, who ruled with a strong hand the

whole of Northern I.

After the death of Harsha, the hist. of is a confusi a a aversties and kings, whom it is impossible to mention in detail. But gradually in Northern 1, the provinces began to find some shape and form under the gov. of the Rajputs, or members of the rubug families. At the end of the muth century the most unportant king-dom was that of Panchala, whilst the Pala king- ruled in Bengal, and another in portant dynasty was that of the Chamel. portant dynasty was that of the Channel. Until the end of the third century the Andhra dynasty juled the Decean, and this was succeeded by that of the Chai-ukya Rapputs, which lasted until the beginning of the seventh century, and was then merged in the Chola dynasty. Early in the eighth century Arab armies con-

The close of the tenth century witnessed the beginning of the locursions of the Muslims. The great Moslem empire originated in the setting up of two small independent Moslem states in the N. of I. The founders of both these states were originally slaves, and they were bitterly opposed by the Ralputs. In 987 the Sultan Mahmud of Glazni ascended the throne of the Amir of Sabuktigin, and commenced a holy war against the inhab, of I. In a great number of campagns he gradually increased his power until it extended practically to the Decean.

Dynasty after dynasty settled themselves Dynasty after dynasty settled themselves at Delhi, and gradually spread into the Doccan itself; amongst the Moslem states formed in the Doccan, the more important ones were Golconda and Eugapur. The beginning of the thirteenth century vitnessed the incursion of the Mongol chieftain, Genghis Khan. The Mongol chieftain, Genghis Khan. The Mongol bands however, although they strained

Central Asia of Timur the Lame (usually spoken of as Tamerlane), who swept all opposition before him, and after perpetrating a fearful massace before Delhi caused himself to be proclaimed emperor of 1. Between 1000 and 1500 a succession of Afghan invaders drove right across North I. Moslem dynasties ruled at Delhi from the Punjab to Bengal; and the new conquerors pushed farther S. than any of their predecessors. Five separate Moslem Kingdons were set up in separate Moslem Kingdoms were set up in the Decean. Only S. of the riv. Cauvery was flindu I, saved from the invader. Flindly, from 1505 onwards, over the same N.W. passes, came the Moguls. At the beginning of the sixteenth century, however, appeared the greatest of all the conquerors of 1, in the person of Baber. He was a Mongol descended from Taimur and Canghis Khun. In the year 1526 he defeated the army of the Sultan Ibrahim in a battle fought to the N. of Delhi, and was proclaimed emperor of 1. From this interest discounted, at least nominally, from the who ruled, at least nominally, from the time of Baber until 1707. For a time belai alone remained in the hands of the conqueror, but gradually the whole of Northern I, was conquered. The greatest of all the Mogul emperors was Akhar the Great (15:6-1605), to whom the whole of I with the exception of the very S, owed allegance His legal code, the brilliance of his court, and the magnificence of the arcentecture of his reign are all worthy of note. Akbar was far more liberal in the n after of religion than the contemporary soccielens of kurope; but for one reason or another multitudes of ludians, especially in the N., accepted their Moslem con-querors' creed; and so 'beneath the sur-face or unity the soul of 1, was divided between two futtes or two philosophies of life a gulf which seems to-day almost as deep as when it was first cut so long ago isn R. Coupland). The last of the great Mogale emperors was Aurungable, who died in 1707 marking the final break-up of the Mogul empire, on whose mins the balantias formed an empire which was the greatest and most important in I. in the middle of the eighteenth century. On the break-up of the Mogui empire, the following practically independent states s; ranginto existence, that of the nabob of Outh, the nizam of Hydersbad, the nabob of the Carnutic, and Hyder Ali at Seringa-patum. Little by little the provs. of the Mogal empire fell away from their allegi-ance. The Decean became independent. one. The Decean became macpearant, that followed suit. Rengal, Behar, and Oussa, though nominally still dependent, whom's and purpose inbecame to all intents and purposes in-dependent. A general revolt of the provs. took place, and to make the coninsion worse confounded, a foreign invader in the person of Nadir Shah, Shah nesses the incursion of the Mongot stater in the person of Nadir Shah, Shah chieftain, Genghis Khan. The Mongot of Persia, appeared in the land. The hordes, however, although they attained considerable power in the N.W., were, and they were now the greatest power in nevertheless, unsuccessful in their attempts to penetrate into I. itself, and by descendants of the Mogul dynasty; but these attempts were beaten back principally by the Moslems of Northern I. nominal kings. The shah, having plundin 1398 came the great invasion from ered Delhi, returned home to Persia, and I. was again free of foreign invaders. Nevertheless, she was now but a conglomeration of independent states. The Punjab was annexed in 1761 by the Mahrattas who were finally defeated by a coalition of the Muslim princes in 1. who

feared the growing power of the Hindus.

The first European settlements and the power of the British in India.—Europeans had for a long time known of the existence of the trade route to I. via the Red Sea, but the estab. of a Muslim power in Egypt had effectually closed that route to trade, and the result was that it had been necessary to seek some new way of approaching I. Towards the end of the afteenth century many attempts were made to double the Cape, and finally the task was accomplished by Vasco da Gama. task was accomplished by Vasco da Gama, who arrived by that route at Calleut in 1498. After this, the Portuguese made many settlements on the W. coast, the most important of all being Goa. But towards the end of the sixteenth century power in the E. began to pass into the hands of the Dutch. The Portuguese was driven from Caylon and the Dutch. were driven from Ceylon, and the Dutch also estab. themselves firmly in the Malay Peninsula. The next great struggle which ensued was that between the Brit. E. India Company and the Dutch. The latter were inally driven out of I. altogether. England first appeared to claim a share in the spoils of the E. in 1600, when she obtained a chatter for her E. India Company (q.v.), and her first factory was estab. at Herat in 1608. Trade, and trade alone was the E. India Company's objective; and trade, moreover, obtained objective; and trade, moreover, obtained by peaceful enterprise and agreement, not by force. The Company's first act was to send an envoy to the Mogul Emperor at Delhi to secure his permission to establish a trading-post on the coast. The envoy was followed by a full-scale ambas., Sir Thomas Reo (q, n), whose title to fame is founded on his formulation of the Company's polloy which was not to to fame is founded on his formulation of the Company's policy, which was, not to waste money on military adventures or in acquiring ter., but to 'seek profit at see and in quiet trade.' (P. E. Roberts). In 1639 the site of Madras was bought, and in 1661 Bombay passed as the dowry of the queen of Charles II, into the hands of the Company. In 1690, after many failures, a settlement was made on the Hugil, which developed into the city of Hugli, which developed into the city of Calcutta.

The Fr. appeared in I. later than the Eng. A company with somewhat similar objects to that of the E. India Company was founded in 1664. Their most important settlement was at Pondicherry, which they retain even to the present day. Although, as will be shown, they made a great struggle for political power in I., they falled very largely because of the lack of interest of the home gov. By the time of the collapse of the Mogul Empire the E. India Company had acquired three prin. trading posts—at Madras, Bombay, and Calcutta; and, in order to protect and Calcutta; and, in order to protect
these posts from pirates and from European rivals, forts were built and bodies of
Indians known as 'sepoys,' enlisted and
in a state of flux. The first results of
drilled under Brit. officers. The life Brit. conquest in the eighteenth century

struggle for supremacy in I. between the Fr. and the Brit. commenced during the War of the Austrian Succession (1740 48). During this war the Fr. had been the more successful, and had, in fact, captured Madras. The treaty which ended the war, however, ordered the restoration of all conquests, and so Madras ugain passed into Brit. hands. With the outbreak of the Seven Years' war (17.6-63) rivalry between France and England was renewed. A series of succession questions in the Decean had given both a pretext for joining in the native quarrels, and now the attention of the Eng. commander, Clive, was called from the Decean to the N. The succession of Surajah Dowlah to the throne of Bengal had brought about the throne of Bengal had brought about the Black Hole of Calcutta, and Clive came N. with Watson to revenge the massacred Eng. The battle of Plassey (1757) cusued, and with the victory of the Brit. Company troops at that buttle began the final supremacy of the Brit. in I. Three years later, at Wandewash, Sir Eyre Coote finally broke the power of the Fr. in the Deccan.

The throne of Bengal had passed into the hands of the nominees of the Brit. Company, and out of gratitude favour after favour was heaped upon them. But for a time the Brit. Company still re-garded the victory which they had won as merely a means of definitely establishing as merely a means of definitely establishing a monopoly and not an empire. Cilive, when he returned to I. in 1765, realised that it was possible to build up a great Brit. empire on the ruins of the fallen Mozul empire, but he advised against taking the risk which was necessary. The Company collected the revenues of Bengal, Behar, and Orissa, but as the vassals of the propriet engagers of fells. of the nominal emperor at Delhi. Clive during his administration pressed on many reforms which were necessary, but was sadly hampered by the fact that any reform which entalled a diminition of dividend was not popular with the board of directors who still ruled I. Finally, in of directors who still ruled I. Finally, in 1767, he returned to England, and was later bitterly attacked. The House of Commons, however, recorded its appreciation of the services which he had rendered; but worn out by the attacks and by ill-health, he committed sulcide in 1774. Cilve may well be regarded as the founder of Brit. greatness in I., and had witnessed the Company become the sovereign of Bengal, Behar, and Orissa. In the meantime the Eng. had been left with a clear field in the rest of I. after the treaty of Paris (1763). The Portuguese, the Dutch, and now the Fr., had all disappreared as rivals to the power of England. appeared as rivals to the power of England. Henceforth the king, could consolidate their power with little fear of interference from any of the European Powers. The Brit, power was threatened by Hyder Ali of Mysore, but the victory of Coote at Porto Novo again asserted the power of the Brit., which had seemed to fall at the

were deplorable because in England both politicians and commercial men had failed princes did much to extend the power of to grasp the significance of the conquest. Britain throughout the whole peninsula. Clive had realised all that was implied in Clive had realised all that was implied in the 'sovereignty' of Bengal, and in a letter to the elder Pitt had suggested that the Brit. Gov. should oust the company and shoulder the task. It took the Com-pany some time to realise that it was a sovereign power, but finally, in 1772, it appointed Warren Hastings as governor of Bengal. There are points which are debateable in the career of Warren Hastings, but here it is necessary only to mention the events without discussing ethics. Hastings certainly reformed the revenue collecting system, estab, civil and criminal courts, and made large economies. He sold certain ter, to the nabobs of Oudh, but by so doing set up Oudh as a buffer state between the Brit, and the Mahrattas, and later, when he gave the nabols of Oudh help in the Robilla war, he did so because he realised that the Robillas were a real menace to the Brit. In 1775 Lord North's Gov. passed the Regulating Act, which gave the home gov. or rian powers over the officials of the E. India Company, and instituted a suprome court of justice and a council of was Warren Hastings became the first governor-general, but for a time the hostility of his councillors prevented the operation of his schemes, During his period of power hardly any annexations had been made. Some ter, had been gained round Bombay, but on the whole he had been opposed to annexation, otherwise he would probably have annexed the ter, which he sold to the nabobs of Oudh.

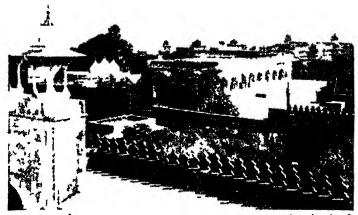

In 1784 Pitt's India Bill was passed, which created a council for 1. on which sat certain of the directors and the board of control, nominated by the crown. The real power was now in the hands of the crown, although nominally it still re-mained with the Company, a state of affairs which existed until 1858. Lord affairs which existed until 1858. Lord Cornwallis both governor-general and commander-in-chief, had power of veto to an extent never employed by Warren Hastings. He busied himself at first with internal reform, and estab. a proper system of civil service for the servants of the Company. He was responsible in 1793 for the permanent settlement of Bengal, Behar, and Orissa; by this the assessment of the revenue was declared per-petual. Legal reform also occupied his attention. The attack by Tipoo Sahib attention. The actions by ripho semi-on Travancore, however, necessitated the interference of Cornwallis, and the war ended by the cession of half of Mysore to the Company. The ter, acquired by the Company went to form the beginning of the Presidency of Madras. Cornwallis Company went to form the beginning of the Presidency of Madras. Cornwallis left I. in 1793, and was succeeded for a time by Sir John Shore, who, five years later, was succeeded by Lord Welleaey, probably the greatest of all the governorsgeneral after Warron Hastings. In 1799 the fourth Mysore war broke out, undertaken by Wellesley with definite alms. It was short and in the course of it Tipoo Sahib was killed. Wellesley was an open advocate of a policy of annexation, and

out, and Gen. A. Wellesley (brother of the governor-general) won the battle of Assaye against overwhelming odds and practically broke the power of the Mahrattas. Almost at the same time Lake defeated another army and entered Lake defeated another army and entered belbi. The troops of Sindia were utterly defeated, and the prince accepted a subsidy from the hands of the Brit. The aggressive policy of Wellesley, however, led to his recall, and Cornwallis was sent out for a second term. But Wellesley had been instrumental in causing many reforms in I., in establishing a school for civil servants, and in bringing the finances. civil servants, and in bringing the finances of the country into a sound condition in spite of the expenses of his numerous campaigns. During the eighteenth centurs the power of the Sikhs had been in reasing continually in the Punjab, and they now, under their leader, Ranjit Singh, put forward claims, that could not for one moment be admitted by the Brit, to ter, in the Punjab Itself. A Brit, Army to ter, in the Punjab itself. A Brit. Army was sent against Ranjit Singh, but no fighting took place, the menace being sufficient. Under Lord Minto's governorship missions were despatched to Persia and Afghanistan to combat Fr. influence, whilst at the same time attacks were made on the Fr. colonies of Mauritius and fle de Bourbor, the Dutch colonies in Java also being attacked and captured. The monopoly of the E. India Company was abol-ished in 1813, save so far as trade in the China seas was concerned. The period between the departure of Wellesley and the arrival of the Marquess of Hastings was one of stagnation. Hastings, however, reverted to the policy of his predecessor. During his governorship the Gurkhas were defeated and part of their ter. of Nepal was annexed; and the war against the Pindaris widened into a war with the Mahrattas, much of whose ter. in the neighnourhood of Poons was annexed.

Hastings left I. in 1823. Brit. supremthis tings left 1. In 1823. Brit, supremacy over the native states was finally estab, and the whole peninsula of I. was ruled by the Brit. But an independent kingdom had been set up in Burma, Aighanistan had developed into a really strong state, and under Ramit Singh the state of the Punjab had been unified and strongthened. Almost immediately there were clashes between Britain and these title. The European was resulted these states. The Burmese war resulted in the loss of some ter, to the Brit. Afghanistan, regarded as an important buffer state betrigartest as an important contensate op-tween Russia and Brit. 1., became for a time the centre of the storm. The Per-sans, influenced by the Russians, inter-fered there; the Brit. to protect their interests, were forced to intervene. They were at first successful, but a later Afghan later, was succeeded by Lord Wellows, probably the greatest of all the governors-rising drove the nott of Afghanistan, and genoral after Warren Hastings. In 1799 the fourth Mysore war broke out, undertaken by Wellesley with definite alms. It was short and in the course of it Tipoc Sahib was killed. Wellesley was an open prisoners released, and the Brit. evacuated advocate of a policy of annexation, and the country. In 1843, Sind (Scinde) was

annexed by Sir C Napler, and the next ridges were smeared with the fat of the war broke out on the death of Ranjit cow and the pic, thus defling both Hindu Singh, 'the lion of the Punjab Fwo and Meslem emissed the Indian singly, the non-of-the radion 1860 wars were fought with the Sikhs, the first in 1843, the second in 1843 49. The Sikhs of the Punjab were the most for indable enemies the Brit had yet met in I, but the victory at Guirry (1849) de livered the Punjab to the Brit In 1832 Lower Burms was annexed during the governor generalship of Lord Dalhouse and in 1556 Oudh was also annexed Nagpur and Chansi also passed into the possession of the Brit about the same time Between 1525 and the outbreak of the Mutiny many social reforms had force advanced against Delhi. Havelock

cow and the pig, thus delling both Hindu and Moslem enraged the Indians. The Mutiny broke out on May 10 at Meccut and spread to Dellu Within three weeks and spread to Delhi Within three weeks the whole Cangers busin was all one, and at Delhi the representative of the royal line had ug in been proclaimed emperor of I There were less than 40 000 Brit soldiers to hild in check a pop of well nigh 100 000 000 Campore and Lu know were besinged. The most horrible episode of the whole muting was the massacre at Campore (July 187) But Lawrencheld the Punjab in check a small Brit

taken place under Brit rule The country had been developed, the education of the natives had been encouraged canals had been developed the telegraph and radways introduced a system of cheap postage had also been mutisted and sutter had been abelished this was a practice of Brahman women in which a widow committed suicide in her husband's funeral pyre. These reforms had been especially noticeable during the ad ministration of Lord Dallionse, and must be regarded as one of the causes of the outbreak of the Mutiny in 18-7

Indian Mutiny.—The Indian Mutiny may be traced to many come Inven tions such as the telegraph were not under stood by the native mind, and railway travelling used the ideas of casts. Other causes were the district of the Brit. policy of annexation, and especially great were the military causes. The Sopoys believed themselves the essential part of

marched to the relat of Campore with a small force and Lucknow held out In bet the tide turned at hist. Della was storred Lucknow was temforced by Hay lock and Outram and was relieved by Complete in Nov. although the city
we not finally taken until the following
year. In 1508 the Mutny may be said
to have ended, although the Central It we were not preshed until the follow-Army, recruited chiefly from high caste Hungus and from Mosk ms, who began the rivolt and sustained it, and their main gri vance was their belief that the ulti-nuite intention of their Bilt rulers was to Mutiny was backed by makentonis in Mutiny was backed by makentonis in Mutiny was backed by makentonis in Ondh who had never forgotten or forgiven the amagazion, but it is important to observe that the Mutiny was not a national rebellion against alien rule, and believed themselves the essential part of indeed some Separate tion fully and the Brit. military power in I The campaign in Afghanistan and the late Crimean made no attempt to recover their indeed swar had shaken their faith in Brit. power, pendence On the great mass of the small above all a report that the new cart. had little effect outside the areas of disnad note effect outside the areas of dis-turbance (Sir R. Compland). The chief results of the Mutiny were that the rule of the E. Iudia Company came to an end, in 1877 Queen Victoria was proclaimed empress of I., and the governor-general was known honeeforward as the vicercy. The Indian Empire established.—After the Mutiny I settled down to a veried of

the Mutiny I. settled down to a period of peace broken only by the constant suspicion of Russian intrigue in Afghanistan. This led in 1878 to the second Afghan war. The Amir was deposed, and his successor promised to receive a Brit, resident, who was shortly afterwards murdered with his escort. This resulted in the famous march of Roberts from Kabul to Kandahar, and eventually an Amir who was favourable to the Brit, was installed. Quetta and the S.E. dists, of Afghanistan were unnexed after this.

In 1885 Upper Burma was annexed as a result of the third Burmese war, and the Indian empire was practically com-pleted. The 'Morley-Minto' constitu-tional reforms may be briefly noticed. These enlarged the legislative councils, accepted the elective prin, and gave Indians a direct share in administration by admitting an dian member to the Executive Council in each of the provs. and at the centre. But if Lord Morley, then secretary of state for I., was the leading exponent of the Liberal tradition, he did not intend that these reforms should lead directly or indirectly to the estab. of a parl, system in 1. Opinion in England was not favourable to democratic instrtutions for 1. State-men and official-alike recognised that majority rule was impossible for a country which was anything but homogeneous. But on the whole, after the Mutiny, knt. statesmen were occupied in attempting to better the lot of the Indian pop. The plague, which used so frequently to occur has been combated, rullways have been fully developed, and, above all, education has been much improved. Legislative councils adopted for each prov., and the electoral system developed in the constitution of the Vicerov.

After his coronation in 1911, George V. visited 1, and held a Coronation Durbar at the beginning of 1912, this being the first visit of an king, sovereign to the Indian empire. At the Durbar the King-Emperor announced that Delhi would be the new cap. of I. Later Indian hist, is the new cap. of I. Later Indian list, is entirely political and concerned with the movement for Home Rule. For a time, the First World War put a stop to the movement; but the revolutionary spirit, which had sprung up in the last few years was only alumbering, and in Sopt. 1911 there was rioting in Calcutta by Sikhs rotarning from abroad, and the Punjab was in a disturbed state till the end of 1912. There was also evolutionary activity in There was also revolutionary activity in Bengal. After a two years' luli in politics the diome Hule movement was started again by Mss. Besaut and Thick with fresh attempts, and in Dec. the Congress and the Monley League declared for it. In 1917 E. S. Montagu, secretary of state for I.. arrived to discuss what steps should be 1948 the Simon Commission arrived in I.

taken towards establishing a gov. responsible to the Indian peoples. In 1918 a report by the vicercy and the secretary of state was pub, proposing reforms in local self-gov, the administration of the Provs., the Contral Gov., and the relations of the Native States. Appointments were to be made to all branches of the public service without distinction of race. Those were indignantly rejected by the Home Rule leaders. After the Rowlatt Committee, appointed to consider methods of dealing with lawlessness, had reported in 1918, measures in accordance with their recommendations were passed in the Imperial legislative ('ouncil in Feb. 1919 against the votes of the non-official Indian memthe votes of the non-official Indian members. Outside the Council the opposition to them was widespread and highly organised; Gandhi (q,n.) hummarated 'civil disobedience,' and a general hartal (stoppage of business) was planned for April 6. Throughout April there was rioting and loss of life. On the 13th at Amrisar about 379 persons were killed by the military. The events of April had a serious effect, and the delay by the Central Goy. (for good reusons) in holding O ntral tiov. (for good reusons) in holding an inquiry made the position still more difficult. In the summer a committee of the Lords and Commons in London had been considering the Gov. of India Bill. drawn up by Montagu, and made various recommendations. The Bill modified ac-cordingly, was passed in Dec. 1919: dyarchy was abolished, the Council of State became a second chamber, the budget was to be voted by the Legislative Assembly, cuttain franchises (racial, etc.) were created, and a High Commissioner in London was appointed. Stress was laid on the intention that the Bill was not demittive, but only provided for a period of transition to a form of self-gov. The new constitution began working on Jan. 1, 1921, and on Jan. 10 the duke of Connaught landed in I. to inaugurate the new order. I. was being deeply stirred by an agitation which outwardly conformed to (randhi's policy of non-violence throughout 1921 there were outbreak- all over I. and crime generally increased. In March Gandhi started his home spinning comnish none squared this none square each page to oust all imported cloth. In the N, the Punjah was seething with unrest among the Sikhs owing to religious disputes; encouraged by congress propa-ganda, the new section among them known as the Akalis proclaimed the restoration of sikh rule. In April 1921 Lord Reading became vicercy in succession to Lord Chelmsford, and the Rowlatt Acts were repealed. Attempts were made at an early stage in the new Imperial legislative Assembly to amend the new constitution but the home Gov. refused to move. In but the nome (no. remains to move, in March 1922 Gandhi was exrested, and sentenced to six years' imprisonment. In 1924 be was released on grounds of ill health, and more or less withdrew from politics till oarly in 1926, when he started once more a campann against Brit. rule, picking out the salt monopoly as a special object of attack.

Steps toward Self-government.—In Feb.

to study the whole constitutional question, and in the following year the Viceroy, Lord Irwin declared that dominion status was the aim of Brit. policy. The Com-mission had been called upon to report whether and to what extent it was desirable to establish in Brit. 1, the principle of responsible gov., or to extend, modify, or restrict the degree of responsible government then existing. It had been provided, when the original Brit. I. constitution was set up after the war, that it should be periodically revised; the Simon Com-mission whose report was pub. in 1930 represented the first of these revisions, and, in view of the disadvantages of such periodical overhaulings, found itself at the very beginning forced to suggest that the original recommendation should be cancelled, in order that any scheme adopted should not seem to be only a temporary measure, and changes made only so far as time night show them to be needful. Dyarchy, with its fixing of certain functions in the prov. govs. which might not be exercised by Indian ministers, was recommended for abolition. As a whole, the future constitution of I. was to be federal in its essence, that is, there was to be a central federal assembly made up of members elected not by constituencies directly, but more indirectly by the prov. legislatures. Provision was to be made for consultation of All-India questions be-tween Brit. I. and the Indian Native States: the police was to be under the states; the police was to be under the administration in each prov. of a minister who would be part of the gov. as a whole, and share in its responsibility to the legislature. As to the protection of the minorities, the Commission proposed the continuation of general accurate the continuation. continuation of separate representation for Moslems, for Sikhs, and for Europeans, and also for the depressed classes; and powers were to be reserved to the governor on behalf of the protection of minorities. Such were the main recommendations of the Simon Commission, which were put forward for public discussion.

The report of the Simon Commission marked the first stage of consultation and preparation, the second being the convening of three Round Table Conferences in London between 1930 and 1932. Prior to the first of those conferences the Brit. Gov. had issued a preliminary statement of its Indian policy which was approved by Parliament. After consideration of the Simon Report and the discussions of the Simon Report and the discussions of the Round Table Conferences, the gov. pub. its own proposals for Indian constitutional reform in a White Paper issued March, 1933. But there was still to follow a third stage of consultation, the White Paper proposals being submitted to a large joint committee of both Houses of Parliament. The Committee having consulted representatives of Brit. I. and of the Indian States, reported in Nov. 1931, with the result that the gov.'s proposals were altered. Then in Aug. 1935 came the second Act for the Gov. of I. This Act, unlike those which gave self-gov. to Canada, Australia, and S. Africa, was essentially an enactment of the Imperial Legislature and not of a dominion

parliament followed by formal enactment of the imperial parliament. Yet, considering the divergence of opinion in I., consultation followed by an imperial act was the only practicable method, particularly in view of Brit. responsibility for the minorities. But this stage had not been reached without incidents. For in Aug. 1934, Gandhi had set out from Poona to vils. in the Kaira dist. to foment evil disobedience; but he was again arrested and imprisoned. He then concentrated his energies on the Harrian—'Men of God Movement,' aiming at communism on the Russian model; but he had by now lost much of his Hindu support. Terrorism, however, now arose in Bengal again, and there was trouble on

L.N.A.

NEW DELHI: GOVERNMENT BUILDINGS

the N.W. frontier with the 'Red Shirt' agitators and the gov. had to send up troops and gins to ropel marauding Mohmands. In 1933 the Bengal Legislature passed anti-terrorist legislation by a large majority. Meanwhile the Home Rule (Swara) party had tried to make political cap, out of these disturbances, and adopted a resolution rejecting the constitutional proposals of the White Paper. It may be noted that the report of the joint part, committee advocated the creation of an All India Federation composed of self-governing units in place of the existing contralised gov. It also proposed that the provise should be given agrator share in the management of their own affairs. But it recommended that a number of important matters, such as customs and tariffs, should be subjects for the governor-general and his council. The Act of 1935 implemented practically all the recommendations of the joint committee. Put briefly, it provided for an All India Federation, Provincial Autonomy, and tesponsible Gov. with safe-guards at the centre.

The Government of India Act, 1935.
Like the constitution of 1919, that of 1935 falls into two parts: under the first, a full cabinet system was instituted in the provs.—now increased to eleven; while the second part of the Act was directed to the reconstitution of the central gov. But, in the interests of the general well-heing, the prov. governors were given the right of exercising special responsibilities at all times to ensure peace and to protect minorities, and also to legislate by ordinance and pass acts in times of energency.

The Act also extended the prov. franchise, but the property, service, and educational qualifications still remained, and com-munal electorates were still continued, notwithstanding the calstence of a general electorate. This part of the Act came into operation in April, 1937 and worked well, particularly in Madras: but, in 1938, for reasons relative to the second part, the Congress Party instructed its members to resign their cabinet posts, a move which thwarted the general development of prov. responsible gov. The second part of the Act-which never came into operation—created a new federal state com-prising both Brit. I. and the Indian states, with a bicanoral legislature, the repre-sentatives in each House to be elected. mainly, by communal constituencies, but with the representatives of the smaller communities elected by an indirect method and those of the Indian states nominated by their rulers. The federal gov, was based on the system of dyarchy which had provailed since the Act of 1919. Defence and external affairs were reserved subjects, to be dealt with by the governorgeneral and his council with ultimate responsibility to the imperial parliament. Other subject, were transferred to a Council of Ministers responsible to the federal legislature; but, just as in the case of the prove, the full cabinet system as the clearly are medified by writing in the federation was modified by vesting limiting rights in the governor-general.

Ordinarily the governor-general had limiting rights in the governor-general. Ordinarily the governor-general had special responsibilities for the maintenance of order, the protection of minorities the security of federal finance, and the safety of the rights of Indian states; in special circumstances he might issue federal ordinances or even legislate by Federal Act. Legally, the unusquation Federal Act. Legally, the inauguration of this federation depended on the execution of instruments of accession to the federation by the Indian rulers in respect of their states. Morally, too, it would have been unworkable without the general nave been unworkable without the general agreement of Indian communities and parties. Heretofore the Indian princes seem to have been hesitant; the Modenns feared that their community would disappear in a federation; while the Congress Party challenged not only the machinery whereby the Act was made, but the entire constitutional system set up by it. The great problem in regard to the general great problem in regard to the general government of ludia is the old but re-current problem of achieving unity out of diversity—a unity consistent with the diversity engraved in India, and yet transcending and binding its elements together '(Prof. Ernest Barker). The problem could never be solved by merely asserting the unjority principle, which would give the Hindus exclusive power an exclusiveness inconsistent with the spirit of compromise inherent in true democracy. It has been suggested that one method of solution would have been to recognise religious communities as autonomous corporations in their own spheres, that is in matters converning education or the religious life generally. Others suggested that instead of cabinet

posite in character and, like the Swiss form, recruited from the different parties and provs. But whatever method of solution were to be found and adopted, it had to be a solution by Indian agreement. That accomplished, the road might then lie clear to the vindication of the Brit. Gov.'s dictum that 'the natural issue of India's progress is the attainment of dominion status.' This consummation would materially strengthen the bonds of the Brit. Commonwealth of Nations, for through it, I. could influence and deter-nance, for the better, the relations between E. and W., the two major divs. of man-kind. It should, however, be pointed out that as long ago as 1917 I., while in form it may not have had dominion status, yet had even then much of its actual substance. For in that year an Imperial Conference had declared in favour of the recognition, not only of the dominions as autonomous nations of an imperial com-monwealth, but also of India as an important portion of the same. Already in 1917, I had signed the treaty of Versalles and become an original number of the League of Nations, and by 1921 even had fiscal autonomy; and again, in 1932, I. was represented at the Imperial Economic Conference at Ottawa. Thus, I. had for years been steadily moving towards the goal of complete self-gov.

Prov. autonomy was in operation throughout Brit. I, by 1938, though its introduction was attended by serious difficulties, which were surmounted by the difficulties, which were surmounted by the constructive efforts of the viceroy, Lord Linlithgow, and by the conciliatory part played by Gandhi in the settlement of differences which really concerned matters of procedure rather than fundamental questions of prin. Thus, a deadlock was avoided and the Congress Party accepted Ministerial office some waven of the Ministerial office, some seven of the eleven provs. being administered by Congress Ministries by the end of 1938, while in all eleven provs. representative wanto in all eleven provs. representative got, was working far more smoothly and efficiently than had been anticipated. But responsible gov. with safeguards at the centre was still unattainable. The Central Gov. of I. remained the offspring of the Montagu-Chelmsfold reforms as applied to the working Cov. of I. Act as embodied in the earlier Cov. of I. Act of 1919. Both the Congress Party and the Indian Moslems were hostile towards Federation, although for different reasons. The Congress Party opposed the federa-tion of democratic Brit. I. with states which were under more or less autocratic rule. Many of the leaders said that the democratisation of the states was an essential condition of the racceptance of Federa-tion. The Moslems, on the other hand, were opposed to it because the accession of the Indian states, which are mostly Hindu, would give the Hindus an exces-tive indicates. Hindu, would give the Hindus an excessive influence at the centre, where they thought the Congress Party was already too strong. The leaders of the Congress Party resented the possibility that future members of the Federal Parliament might be no more than the mouthpieces of autocrats; and it must be admitted that the more recent high of some of the gov. the federal executive might be com- that the more recent hist, of some of the

Indian states gave some colour to their apprehensions. The Movlems resented the use of the Congress dag as a national they opposed the singing in schools flag they opposed the singing in schools of a Hindu hymn which Congress regarded as a national hymn, they alleged ill treatment of Moslems in Congress governed prove and they asserted that democracy in 1 had failed, since it implied, in the greater part of the country, that the majority party was primarily composed of Hindus and that the Moslems could never form an alternative gov in view of their numerical inferiority. It was for such reasons that they asked for representation in the Congress Cabinets, and it was for such reasons that the viceroy invited party leaders to colla borate in finding some agreement in the field a a preliminary step to con stitutional advance at the centre Faced in 1941 during the any ous days of the war by the continual refusal of the chief Indian political parties to co operate with Indian political parties to co operate with the gov save on their own mutually exclusive terms, Mr Amery, secretary of state for 1, after consultation with Lord Linithgow, decided to enlarge the Executive Council to meet increased pressure of work due to the war and to establish a National Defence (council to associate Indian non official opinion as full as enoughly with the prosecution of the fully as possible with the prosecution of the war, and, shortly afterwards, representa-tives of the prove and of the Judian states were appointed The Brit Gov would naturally have preferred to leave the initia tive to the elected representatives of the major Indian parties but the ittitude of the Congress faits towards the Indian war effort—which indeed Gandhi did his atmost to obstruct—and the absorption of rival leaders in the pursuit of purely tactical advantages made this impossible tactical advantages made this impossible while no constitutional change was in volved in these appointments—constitutional changes were obviously impracticable in the midst of a life and death struggle—and the enlarged Executive (ouncil was not to be responsible to the Legislature, the gov's decision represented a bold departure from tradition and its effect was to give the viceroy a war (abuset containing a marked (abmet containing a marked majority of Indian public men who were as representative of, and as responsive to, public opinion as was possible under existing conditions, Hinaus and Moslams, constructs and Liberal being well balanced. The formation of the National Detence (our il brought representatives of the most influential sections of the community into close collaboration with the Central and prov goys It associated Brit I and the Indian States in the common to a and it provided that large body of m lerate opinion which wanted to make the goy's war effort as national as possible with opportunities for cooperation on a nation wide scale
The next rotable step in the evolution

of Indian constitutional hist was the up to March 1945 put the total on all Cripps' Mission for the creation of a new Indian Union Sir Stafford Cripps, a member of the War Cabinet, went to I. with the draft declaration of the Brit. by 'open rebellion' in pursuance of the

Gov.'s proposals for a settlement of the Indian problem The offer seemed so complete tlexible, and practical that its rejection by Congress came as a surprise even to those who had experience of the congress nund. This offer contemplated I after the war as a self governing country under a constitution trained by an elected body of representative Indians by agree mut among themselves, as a full fledged dominlon within the Common-wealth, and as tree as any dominion to secrete from the Commonwealth and declare its independence While the dor was held open for all Brit provs and Indian governed states to join in the framing of the constitution, it was left and lidian governed states to join in the framing of the constitution, it was left open for those who could not accept the constitution framed by the impority to go their own way binally, during the critical interim of the war when responsibility for 1 s defence had perfore to be borne by Great Britain, leaders of the prin parties were to be invited to be members of the viceroy's I recutive Council, with whom would rest the task of organisms the indirect, moral, and of organisms the inlitary, moral, and material resources of I for the victory on which her future freedom depended. The Cripps' offer suggested that immediately Cripps' offer suggested that incrediately after the termination of hostilities, an elected body, representative of Brit 1, and the Indian states, should be formed to frame a constitution and the Brit (ovindertook to accept any constitution so framed, subject to the right of dissention provs to form separate Unions (Cind 6500 Arril 1942). The Chamber of Irin es were willing that their States should of cinterneces and margin in with the source was compatible with the source party and integrals in with the sovereignty and integrity in formulating a new constitution but after but no, trations the But proposals were reject d by all the Indian party leaders. After a further expansion of the governor general a I secutive Council in July 1942, that I is then consisted of fourteen mem must in the victory and the community in the and of these fourteen, cleven were indians, while for the first time a bikh and a representative of the dept seel classes were included

I at this time presented a political parieto for the outbreak of the second world W in strength and the desire that I should be free. It both sharpened the eaterness? educated Indians to see their country, triged at last of all foreign control and whitted the impattance of the birt people for I is liberation which should prove that their promises had been fulfilled and bear witness to a sceptical world that the imperialism of a bygone ago wis deal. I's share in the war was great end it was still growing at this time, but to the accompanient of regret in British that it clargest and most powerful political organisation in I had not only taken no part in I is valuable contribution to the (commonwalth's war effort (a statement on Indian casualities in the war up to March 1945 put the total on all fronts at 179,759), but on the contrary had been it distage by stage under trandil's obsession of pacifism to seek to impede if the

demand for Brit. abdication. The Congreen Party in fact resolved (at a meeting of the All-I. Working Committee on July 11) to sunction the starting of a mass struggle on non-violent lines on the widest possible scale, unless its demand for immediate transfer of power were not con-ceded. Gandhi, Pandit Nehru (q v.), Maulana Azad, and members of the Working Committee were arrested, and the All-I Congress Committee and the prov. committees declared illegal. In the disorders which ensued on the arrests some 600 persons were killed. Gandhi, in Feb. 1943, then sought by fasting to secure his unconditional release and three members of the Executive Council resigned on the ground that they could not share respon-Sibility for the goves refusal to yield to Gandhi's demand. The pub. corre-pondence between the viceroy and pondence between the vicercy and Gandhi shows that the gov. held Congress and its leaders responsible for the deplorable acts of sabotage and terrorism which had supervened on the Congress revolution of Aug. 1912 (on these disturbances see Cand. 6430 of 1913).

Grave famine conditions prevailed in 1913 in parts of 1 noal; but energetic measures adopted by the new vicerov. Floid-Marshal Lord Wavell (who succeeded Lord Lantibleow in Oct. 1913). mrtigated its effects, though the number of dead from starvation and disease was nearly 700,000 (see under Brogat). In April 1944 some 500 persons were killed in explosions in Bombay docks and 2000 were injured; but whether the explosion-were caused by sabotage or not was not

stuted.

The Brit. Gov. made a statement of policy on I. m both Houses of Parliament on June 11, 1915. The main proposal, which was without prejudice to the first constitutional settlement, was that the members of the vicerov's Executive Council should in future be chosen from among leaders of Indian political life at the centre and in the provs. Meanwhile the Cripps offer remained open to L., the gov. hoping, though on no strong grounds, that Indian political leaders might reach agreement on the procedure by which I.'s permanent form of gov. could be formulated. In the vain hope of ending the deadlock the gov. stated that, provided the party leaders were prepared to cooperate in the successful conclusion of war against Japan, they were prepared to agree to Important changes in the composition of the vicerov's Executive position of the vicerov's Executive Council. It was proposed that the Executive Conneil should be reconstituted and that the vicerov should make his selection from among leaders of ludian political life in proportions which would give a balanced representation of the main communities, including equal proportions of Moslems and Caste Hindus. The mem-bers of the Conneil would therefore he Indians, with the sole exception of the viceroy and commander-in-chief-an essential provise so long as the defence of I, remained a Brit, liability. If co-operation in this policy could be schieved at the centre it would no doubt be re-

flerted in the provs. where, owing to the withdrawal of the majority party from participation, it became necessary to put into force the powers of the governors under the Act of 1935 (section 93). Nothing, however, contained in any of these new proposals affected the relations of the Crown with the Indian states through the viceroy's Crown representative (Cmd. 6652 of 1945). The above proposals owed everything to the initia-tive of Lord Wavell, who convened a political conference at Sinda to take counsel with him on the proposals for a new Executive Council. The conference new Executive Council. agreed that the Council should be reconstituted, but could not agree on the question how it should be constituted in terms of parties and communities. After consultations in London Lord Wavell on return to I, announced the gov.'s intention to convene a constitution-making body, and as a preliminary step he would, take discussions with representatives of prov. Legislative Assemblies to ascertain whether the Cripps proposals were acceptable. But pending the elections the whem between the Hindus and Moslems ber me more emphasised than ever. The Congress Party, through Nehru, made it clear that it would stand out for immediate transfer of power. Jinnah (q.e.), leader of the Muslim League, merely resterated his demand for separation and re-defined Pakistan (q.c.) as including the existing provs. of the Puniab, N.-W. Frontier Provs., Sind, Bengal, Assam, and Balu-chistan. As a result of the general elections the composition of the Central Legislative Assembly was: Congress, 57, Muslim Lougne, 30, Independents, 5, Sikh, 2, Europeans, 8,
The change of gov. in Brit 1 n, however,

was soon to introduce a change of method t not of policy towards the Indian prob-lem. The Attlee Labour Gov. concurred in the Churchill Coalition Gov. spolicy that indians should themselves from a new constitution for a fully autono nous I., but they pursued a different course in the but new pursue a different course in the period accelerating that process. Early in 1916 the gov. sent to I a Cabinet Mission consisting of Lord Pethick Lawrence (secretary of state for I.). Sir Stafford Cripps (Pessident of the Board of Irade) and A. V. Alexander (minister of Defence) to co-operate with the vicercy in preparations for setting up a constitution-making body and for creating an Faccutive Council at the Centre having the support of the chief Indian hodies. When after some three months' negotiation it became evident that, without some miliative from the mission, agreement would not be reached, the Cabinet Mission themselves put forward proposals to the effect that the constitution should be settled by a Constituent Assembly composed of representatives of all communi-ties and interests in Brit. I. and of the Indian states. Their plan contemplated the immediate setting up of an interim gov. In which all the portfolios including that of war would be held by Indians, and that after the gov, had assumed office

the constitution-making body would be assembled. The White Paper (Cmd.) essembled. The White Paper (Cmd. 6821 of 1946) on these proposals opened by repeating the hope that the Indian people would elect to remain in the Brit. Commonwealth but that if I. elected for Commonwealth but that it is specified independence, in the view of the Brit. Gov. Mission admitted that if there were to be peace in I. it must be secured by measures assuring to the Moslems a control in all assuring to the Moslems a control in all matters vital to their culture, religion, and economic interests; but on the basis of census statistics they concluded that neither a larger nor a smaller sovereign State of Pakistan would provide an acceptable solution for the communal problem. Apart from the force of arguments excited the including of necessarily. ments against the inclusion of necessarily considerable non-Muslim minorities there were also weighty administrative, economic, and military considerations, which presupposed a united I. A partitioned I. would result in dislocation of arrangements for defence and communications besides complicating the position of the Indian states The Mission was therefore unable states The Mission was incretore uname to advise the gov, that their powers should be handed over to two entirely separato sovereign states. They suggested, how-ever, that the permitted grouping of provs, with executive and legislative bodies would enable the Moslem areas to legislate in common. The Mission recombodies would enable the Mostem areas to legislate in common. The Mission recommended that the Indian Constitution should take the following basic form '(i). There should be a Union of I., embracing both Brit. I. and the states, which should deal with foreign affairs, defence, and communications, and should be empowered to raise the finances required for these subjects; (ii.) the Union should have an executive and a legislature constituted from Brit. Indian and states representafrom Brit. Indian and states representatives. Any question raising a major com-munal issue in the Legislature should require for its decision a majority of representatives present and voting of each of sentatives present and voting of each of the two major communities as well as a majority of all the members present and voting; (iii.) all subjects other than Union subjects and all residuary powers should vest in the provs.; (iv.) the states should retain all subjects and powers other than those ceded to the Union; (v.) provs, should be free to form groups with executives and legislatures; (vi.) a majority vote of the Legislature Assembly of any prov, could call for a reconsideraof any prov. could call for a reconsidera-tion of the terms of the constitution after an initial period of ten years. In the relationship of the Indian states to Brit. I. the White Paper stated that with the attainment of independence by Brit. I., paramountcy could neither be retained by the Brit. Crown nor transferred to the new the Brit. Crown nor transferred to the new gov. of I. Following the pub. of the mission's plan communal controversy centred on such issues as parity, grouping, and the sovereign rights of the Con-stituent Assembly, and eventually the Mission and the vicency proposed that a body consisting of five members of the Mission League, all members of the Congov. of I. Following the pub. of the mission's plan communal controversy tentred on such issues as parity, grouping, and the sovereign rights of the Contituent A-sembly, and eventually the Mission and the viceopy proposed that a body consisting of five members of the Continuit League, six members of the Congress Party, and one each of the Sikh, Parsi, and Indian Christian minority (q.v.) pointed out that unless there was

communities should form an interim gov. Later it was stated that until a new interim coalition gov. was formed a 'caretaker government' of officials would be set up and that elections to the Constituent Assembly would take place as soon as possible. The elections to 385 seats, held possible. The elections to any street, in July, resulted as follows: Congress, Independent possible. The elections to 385 seats, held in July, resulted as follows: Congress, 205; Muslim League, 73; Independent General, 9; Unionists, 3; Independent Muslims, 3. But as the Muslim League, on July 27, revoked its previous acceptance of the Cabinet Mission's scheme, the duty devolved on the viceroy to try to form an interim gov. The Congress Party's nominoes assumed office on Sept. 2. Subsequently agreement between the viceroy and Jinnah led to the inclusion on Oct. 26 of five nominoes of the Muslim League. Disorders were frequent during these events. Muslim 'direct action day' observed on Aug. 16 was marked by riots in which 5000 persons were killed and many more injured. Later were killed and many more injured. Later in the year psoudo-nationalist outrages by the year psoudo-nationalist outrages by thuse led to heavy loss of lives and wide-spread destruction of property in Bihar, Bombav, and E. Bengal.

The Constituent Assembly, owing to differences among Indian Parties, did not function in the manner intended by the

Mission's plan. In yet another statement of policy ("md. 7047 of 1917) the Brit. Labour Gov. repeated that they desired to band over their responsibilities to to hand over their responsibilities as authorities estab, by a constitution approved by all parties in I., but that there was no prospect that such a constitution and such authorities would emerge; and then followed the startling intimation that the government to scaring intimation that the government of the tended to take the necessary steps to effect the transference of power into responsible Indian hands by a date not later than June 1948. Assuming by then that a constitution had not been worked out by a fully representative Assembly the gov 'would have to consider to whom the powers of the Central Government in British India should be handed over on the due date, whether as a whole to some form of central Government for British India, or in some areas to the existing provincial Governments, or in such other way as may seem most reasonable and in the best interests of the Indian people. The gov., however, intended to put in hand, without delay, preparatory measures for the transference and, while admitting that the efficiency of the civil administration must be maintained and the defence of I. be fully provided for, realised that as the process of transfer proceeded it would provisions of the Gov. Act, 1935.

In the Commons (March 1947) in the

debate on I., Winston Churchill, leader of

the gov. had demissed very lightly the pledges which littain gave in respect of minorities and especially of the depressed classes. The Conservative Opposition in fact considered that the gov.'s policy instead of standing out as a great act of magnanimity and self abnegation would go down to hist as a surrender and a betrayal.

The Indian Independence Act, 1947 — In the discussions of 1946-47 it proved impossible to obtain agreement either on the cabinet mission plan or on any other plan that would preserve the contury old unity of I Cocroin being outside practical politics, the only alternative was partition A political settlement along the lines of Pakistan afforded, at this time, the only practicable alternative to civil war, but the Brit proposals ex-pressly left the way open to negotiation between the communities for an Indian Union of the kind foreshadowed in the cabinet mission's plan. No agreement other than by partition having proved acceptable, a plar is evolved by Viscount Mountbatten and agreed to by Indian political leaders. This plan in release debt are of the transfer. volved a decision of the two Indian parties as to whether there should be a partition and if partition was decided, then two Constitutional Assemblies would deter-mine the future constitution of each of these divs. In these circumstances the Prime Minister on June 3, 1947 aunounced in the House of Commons that the gov proposed to introduce legislation at once for the transfer of power that year on a basis of dominion status (q r) to one of two successor authorities—thereby leaving the Indianum them is a state of the state of th it to Indians themselves to decide whether or not there should be partition. The majority of the representatives of the provs. of Madras, Bombay, the United Provs., Bihar, Central Provs., Herar, Assam, Orissa, and the N.-W. Frontier Prov. and the representatives of Delhi, Ajmer-Merwara and Coorg had, by this Affiner-Merwara and coorginate, by this time, made progress in evolving a new constitution as invited to do in the cabinet mission's plan. On the other hand, the Muslim Lengue Party, including in it a majority of the representatives of Bengul. the Punjab, and Sind, as also the representative of Brit Baluchistan, had sentative of Brit Baluchistan, and decided not to participate in the Constituent Assembly. The procedure provided for in the Brit, plan was therefore designed to enable the peoples of I to decide, and to decide quickly, whether the Brit were to hand over power to one or to two gove, and further, to determine maken to the future rectification of sentative of Brit had subject to the future rectification of frontiers by a boundary commission, the areas of Brit. I within which the two govs., if the In lian peoples wanted parti-tion, should rule The plan of procedura also provided for a transitional period of dominion status for the Indian Gov. or govs, without prejudice to their ultimate right to regulate their own relations with

agreement among the Indian parties the pated the transfer of power which was Gov. would hand over to an indeterminate projected for 1948; for it enabled a beginnumber of authorities, and he thought that using to be made at once with the transfer of effective power to Indian hands by calling into existence a succession gov. or govs. well before even the end of 1947. The sequel to the announcement of this new procedure was the introduction in the House of Commons on July 4, 1947, of the Indian Independence Bill, providing for the estab, of the two independent domin-lons of I. (not Hindostan) and Pakistan on the succeeding Aug 15. The Bill gave extensive transitional powers to the viceroy and governor-general to make orders for dividing between the new dominions the powers of the governor-general in (ouncil and for the div. of the Indian Thus was surmounted the armed forces difficulty of finding a method of effecting the transfer of power without waiting for the completion of the process, almost cert inity lengthy, by which the peoples of I must finally shape their own constitutional arrangements. The Bill also provided for the appointment of boundary commissions for Bengal and the Punjab. I ach dominion was to have its own governor-general; but, pending their diction, there was one governor general for both Full legislative authority in each dominion was vested in its Constituent Assembly, which was, consequently, empowered to create its own (abinct. The Bill did not and could not in relate directly for the Indian states, the transfer of power without waiting for but it laid down in terms the right of the states to accede to either of the new dominions—an important declaration in view of the political pressure to which the view of the pointest pressure to which the concress Party But the Bill also provided that from Aug. 15 the sucrainty of the rown over the states would lapse and all power and authority exercisable by the Crown in relation to them come to an end By its nature the peculiar relation of para-mountey which for so great a period had linked the states to the Crown buld not to transferred to any succession tov. was casontial, indeed, that the states should be given time to adapt themselves to the new regime, and that was the intention of the Bill in so far as the states came within ita - cope. The Indian Independence Act received the Royal Assent on July 18, 1947 Lord Mountbatten who succeeded lord Wavell as last of the viceroys, was accepted by the Congress Party as ivernor-general of the dominion of I and Wi Jinnah (q,v) as governor-general of Pikistan

On Aug. 8, 1947. Delhi and Karachi became the caps of I and Pakistan respectively. Mohammed Ali Jinnah (gr.) was elected presacant of the Pakistan constituent Assembly (Aug. 11) Constitutionally the two new dominions came into existence at midnight of Aug. 14, 1917 Jinnah was sworn in as governor-general of Pakistan and Earl Mountbutten as governor general of I (Aug. 15) Two days later the Boundary Commission's findings on the partition of Bengal and the Brit. Commonwealth and the world at the Punjab were announced, Calcutta large. This procedure, therefore, anticibeing given to 1 and Lahore to Pakistan.

The partition scheme allotted 63,775 sq m with an estimated pop of 6,470 000 to W Punjah and 35,314 sq m with a pop of 11 547 900 to I Punjah Roting on a wide spread scale then broke out in the Punjab and a mass movement from the ript affected areas of the Punjab began Serious disorders in the Punjah and Quetta serious disorders in the l'unjab and Quetfa led to the evacuation of threatened minorities. After the piemiers of the two dominious had conferred at Labore (vept 4) on measures to be taken in this grave emergency violence in the Punjab declined and on Sept 20 they issued a statement declaring their agreement on the une self the converse to established. to remove causes of conflict. When the necessity to co operate in establishing said their intention said their intention. disorders in the Punjab reached an uneass lull in early Oct many thousands of persons had been killed. The lull was broken by frequent minor riots in out lying the and vile and by applicate raids by armed gangs on truns and road con voys on both sides of the Punith border Nor did Dolhi escape the bitterness of communal hate and there whole streets in the Muslim quarters liv described and looted, while their former inhab were either on the move by road or rail to W Punjab or were herded in abject misery and four into refuser camps. Ultimately some six million Muslim refusers were transferred from I to I akistan as a result of the Punjab disorders and five million Hindus and Sikhs from Pakistan ter to Indian (for details of the Punjab disorders see PU JAB History) There was also see PUNJAR History) There was also tension in Kashmir State which developed into armed rebellion (Oct 22) by Muslim peasantry against their Hindu maharajah in favour of Pakistan kashmir however acceded to the Indian Union (Oct 27) and a new interim gov was formed soon afterwards Rebel forces advanced on the cap but were third back. On Nov 9 Indian troops occupied the State of Junagadh (one of the States of the former Western I States Agency) which had previously accided to Pakistan the gov of which lodged a strong protest against this action. It was on this dute (Nov 9) that the Constituent A sembly of I met for the first time as the latinment of the dominion A month liter it was ann nunced in this parliam at that agree ment had been reached in negetiations between I and Pakistan on all outstand mg issues relating to partition This agreement however, did not relate to the Indian is the Muslim Min of Hydera Indian is the Muslim Nizin of Hydera bad are ed to reform he executive council though as the secuely was to show the was far from ending his difficulties. On Dec 19, Firl Mountbatten took the slute at New Delhi of the fare well part of the last Brit troops to leave the cap Five days later flerce fighting occurred between Indian troops and insurgents in Kashmir on the Jammu treet and a week later Bandit Schum

the dominion of I., found themselves reduced to seven groups of 'unions' and a score of units. The latter were cou-fined to the largest states, at first usually fined to the largest states, at first usually held to justify their separate existence where their pop. was at least 1,000,000. But this criterion of viability was soon abandoned and most of the remaining units were either grouped with neighbouring states or merged in adjacent provs. The princes themselves have mostly become political pensioners still enloying some personal privileges but with much reduced privy purses. Two main factors contributed to this process of integration: the influence of Indian nationalism within the states and the determination of the States Ministry at Delhi to remove any possible challenge by disaffected princes see Hydernand. by disaffected princes (see HYDERABAD). Travancore (pop 6,000,000) and Cochin (1,250,000) still retained their identity in (1,250,000) still retained their identity in 1949, but may later be united to a new Kerala prov. of Malayalam-speaking people including adjacent dists. of Madras, Mysore (7,000,000) too, having reached a compromise over popular rule, also remains a separate political unit; but if Madras Prov. should be partitioned into its linguistic coppular, i.'s. Mysore might eventually be merged in Tamil-Nad (as distinct from the Telugu-speaking part of Madras). Some litteen of the former Madras). Some fifteen of the former Decean states, and the states of Kolhapur and Baroda were merged with Bombay. Hyderabad, too, retains a precarious identity, but if Nationalist agitation for partition should prevail, its E, half would probably be assigned to the Andhra-Desh or Telugu-speaking part of Madras and Its N.W. areas would join the Marathi-speaking areas of Bombay and the Central speaking areas of Bombay and the Central Provs, to form a new prov. of Maharashtra. The half-dozen Gujerat states, merged with Bombay Prov. early in 1948, have mostly lot their sev. identifies. A group of minor states, formerly under the Chattisrarh and Orissa Agencies, were merged early in 1948 into the adjacent Contral Provs. and Orissa and have vanished from the map of I. Kutch in Western I, and chamba and Bilaspur in the Flimplayan joothills are directly Western I, and chamba and Bilaspur in the Himalayan toothills are directly administered by the I mon Gov. of I. Rampur and Benates (in the United Provs.) and Cooch Bihar. Tripura, and Manipur (in Assam) still retain their identity, but will probably be absorbed. The status of Kashnir, which is in dispute between I and Dollaten will aventually

Baghelkhand states, and the most backmagnetic and states, and the most occurrence ward and underveloped part of I. In default of some capacity for self-gov, the union may be merged into the adjacent United Provs.; (1) Rajasthau, the biggest of all the unions. Its membership of ton Bainville and the default of the self-government of t of ten Rajputana states, headed by I'daipur, was expanded in 1919 to include four inportant Rajput states hitherto regarded as 'viable units'—Bikanir, Jaipur, Jaisalmer, and Jodhpur—and thereby became the greatest administratwo unit in I, with an area of 121,000 sq. m. and a pop. of 12,000,000—notable achievement of the States Ministry; (5) Mat-ya (E. of Rajasthan) whose future status is under consideration. Probably Alwar, one of the states of the union, will join Rajasthan, while Bharatour and Pholpur states will merge with the United Provs.; (6) five Sikh states of the R. Punjab, headed by Patiala (pop. 2000). the E Punjab, headed by Patiala (pop. 2,000,000); and (7) Himachal Pradesh, also in the E. Punjab and formed out of ten small hill states, differing from other mions in that it is directly administered from Delhi. All these changes have conduced to the unification of I. However arbitrary the methods used, realism demands the admission that the continuation of the states as strongholds of a derinand the admission that the continuation of the states as strongholds of a picture-que mediaeval feudalism and despotsm had become an anachronism which could not long have resisted the democratic forces germinating through-out I. It is evident that the states must conform to the pattern of political progress in the rest of I, and already they have been shorn of much of their former splendour. Courts, banquets, processions, and lavish hospitality must be adjusted to restricted privy purses. The princes are now either servants of the people or absence aristocrats, some, however, have been recruited into the forcign seron three subjects only—defence, foreign relations, and communications, but are regular aligning themselves with the provs. in their polity, and in 1949 the Rappramukhs (comparable to prov. governors) of all unions signed fresh instruments of accession conceding to Delhi ben-lative powers in respect of all subjects which the provs, themselves conceded to the Central Gov.

Manipur (in Assam) still refain their identity, but will probably be absorbed. The strius of Kachmir, which is in dispute between L and Pakistan, will eventually be decided by a phobiscite under the anspices of the United Nations (see Kashmir). The seven proups or unions are: (1) Saurashtra, a combination of 280 states and estates in Kathiawar; (2) Madhyahad estates in Kathiawar; (2) Madhyahad estates, the largest of which is Gwalier (see the Buddhists, Then there are also the Pharat, the official style of a union of twenty-eight of the twenty-nine Malwa states, the largest of which is Gwalier (3,000,000). This union, like that of Saurashtra, has achieved a degree of stability, but there is conflict over Bhopal, the twenty-ninth Malwa state, between the Central Provs. and Madhyahad hist, but agitating for its absorption into their ters.; (3) Vindhya-Pradesh, a gnion of thirty-four Bundelkhand and

Kolarian languages (see further under INDO EUROPEAN LANGUAGES) The Veda is one of the oldest and most important of the literary works belonging to the Indo European languages It is not a series of books, like the Heb Bible, but a great itterature which grew during the centuries, and for many generations was handed down verbally. The Vedic Interature is now separated into four classes.—Sambitas or collections of hymns, Brahmanas prose texts, tranyakas, foresticate and I panishads, secret doctrines. The Sumbilas may again be divided into four dive, and it is because of these dive that the Vedic iterature is sometimes spoken of as Vedas "It rature is sometimes spoken of as reassumstead of Feda. The Kalpasutras, manuals of ritual, also form a literature closels allied to the Veda but as it is not considered to be of divine revelation it is not included in the Veda but laterature proper. The first traces of epic poetry are to be found in the Veda, but later a whole beginning by your sumy by whole heroic literature grow up sung by the sutan or bards at various festivals These epics and ballads have been col-lected into two great epic works which are rather complete literatures in themselves than single poems. The first of these, the Mahalharata (q r), is the narrative of the battle of Bhanatas, and the author is traditionally supposed to be an anct mythical secr. Vyasa, who is also supposed to have compiled the Vcd and the heroic

century B c; but much of the Ramayana seems to have been added at a later date. There is more unity, however, in the Ramayana than in the Mahabharata, but which of the two is the older it is difficult to determine because neither may be in its original form The Ramayana may be considered the cpic of Eastern I and the Mahabharata of Western I The Puranas are 'old nurratives,' and their date is uncertain, but they belong to a later Indian religion, Hindiusin There are eighteen 'Great Puranas' and sev lesser ones. The date of the lighteen to religious literature of the Buddhet, the religious between the fourth and third centuries. See also HINDUSTANI LANGUAGE and LITFRATI RI

INDIAN ART—The earliest known art of I is that of the Indus valley culture (7v), dating from about 2 00 BC and Mesopotamia The Indus culture was succeeded after an unknown interval of time by the Arsan culture which again centred in the Indus valley and dates perhaps from 1000 B C or carlier. This age is known from the Veday, but none of the buildings or sculpture of the time has survived. The first period from which dates a continuous knowledge of Indian art comes much later. It possesses a dis att comes much later. It possesses a distinctive Indian character. During the rights of Chandragupt Maury (322-298 BC) and of his grandson Noka (273-232 BC), in puticular, it is known that sulpture and architecture, the arts in which I has made its greatest contribution to the world, flourished. Persian influence had been in existence since about 800 BC, and was particularly evident during the Municup period. The communicative pullars erected by Nobla may memorative pillars erected by Asoka may have been Persian in origin. Asoka being a devout Buddhist also built a number of burnl mounds enshrining Buddhist reiles. The greatest of these was the great Stupe or burnal mound at Sanchi in Bhopal Among smaller works a number of inter-esting portrait heads in sandstone and grips of figures in terracotts have sur vived Early Indian art is rullstir, orn uous, pantheistic seldom idealistic The tridition continued during the post Maury in periods—the Sunga and Kanya dynastics from about 200 B.C. up to A D. 20 Literary evidences show that painting was also practed, mainly as mural decora-A) inta caves in the dist of Khandeish in the Decem (Hyderabad) belong to this carly period. The Alanta freecoes were painted over a period from 200 H c. to the seventh century and hev depict realistic seems from Buddhist life, and parables from the Puddhist religion and as composit one are among the great works of art of the world. Long subtle curves, bold and vigorous lires, and uniform thickness of line are the chief features. Water-colour, and ingredients made of coloured story clay and different ways and the stone, clay, and silicates, were used. Ok and carly Christian influences made them poems, Puranas (q v). The second of the two epics, the liamayana (q v) is probably edited the work of a post, named Valmid, who, as far as it is known, lived in the third kings, particularly Kaniskha (120-162).

From this time date the early sculptured figures of Buddha which have become so well recognised a feature of Indian art The Kushan Unpir was succeeded in Northern I by the Cupta dynasty when Chandragupta I came to the throne in a D 320 The dynasty survived for nearly 300 years when it was finally over nearly 400 years which it was finally over come by the unvasion of the Huns as a result of which few examples of the art of the period have survived. I nough is known however to show the excellence to which the art of sculpture attained espocially in the second quetted on the walls of temples. The caupta period is in walls of temples—The Gupta period is in fact reckoned as the great age of Indian sculpture. The style is its heavy than that of earlier years and is richly decor-tive. It was the cupta artists who evolved the most perfect forms of the Buddhist and Brihn an divinities. The Buddhist and Bribn an divinities temples were built structurally, and not a enclosures, with short pillars crowned by heavy square cupitals Gk influences were by now completely absorbed. Metal casting was carried out with enhanced excellence a remarkable example being the colossal statue of Buddha from Sultan gan; of the fifth century now in the Birmingham m; u In Southern I in the Deccan a style of flat roofed architec ture with horse, shoe arche, and decorative columns was developed. The stability given to the country by the Andhra dynasty which ha ted from 22 > B (to the third century an allowed continuous development. This dynasty and its sic cus ir, the Chalvilla are remembered for its elal crate temples hewn from the rock Southern Indian architecture achieved its greatest success under the Pallava dynasty (fourth to eighth century) and the (holas (tenth to thuteenth century) to whom h long some of the finest or amples of know castin. A distinctive feature of Dravidian architecture under the Cholas was the Lymanid shaped tower surmounted by a stone monument the great temple at Tanjore the tower of this description race to a height of 190 ft Some of the glories of Gupta art we revived in Northern I during the reign of Harsha With the death of Harsha in A D 647 the hist of ait in the N shifts to the kingdom which was founded in Bengal by the Pala dynasty in 1 D 7:0 and lasted until the Muslim invasions of the twelfth century. Much intricate and carefully wrought metal work! longs to this perio! The sculpture notably Buddhistic figures in black slate, up norm ites to metal work and lacks the sensuous modelling of earlier periods Artists whose names are known through the writings of a Chinese missionary as having belonged to the Pali school of art are Dhimana and his son Vitapala

During the medicial period that is the six hundred years from the death of Harsha to the Mohammedan invasions architecture was the principal form of art Much was destroyed by the Moslems. The Rapputs of the tenth and eleventh een The turies undertook many great building and engineering facts. A medieval Indo

Among other of the Dill sultans who wer great builders was lu 12 Shih (13) I Sb) who with the aid of his architect Malik (hizz) sahana en led Delhi and built many new the He wa also careful to r ster earlier monu Before I came under the rule of Mogul emperors a nation must be or if of the artistic achievements of the cipius who ruled in Vianagar in Malas from 1336 the traditional date of the founding of the empire until 1565 wh n heetly was sack div Muslim armies fron the N. The temples built under the Virmis ir dynasty show am ignificent and vinerant style contracting with the of 1 unting and scultture also flourished I n ler the Mogul emperors a blending of Hindu Islamic and Persian styles trindu Islamic and revision styles is silted in a flowering of the arts, particularly architecture in a sculpture. The sutiful city of Latchpur Skrijs perhaps the greatest monument to Akbar who however planned hown mausoleum at al indara. This with its four terraces an i white marble sup retructure us com-pleted in 1612 during the reign of 1cl angir Io has successor which Ichan (1821-58) are owed the most celebrated examples of Mogul architecture—the mausoleum of I changir near I ahore and at Agra the Pearl mosque and the Taj Mahal The Aryan type of architecture was evolved in Persian influence predominated over the

Hindu and decoration became more claborate than was to the taste of the earlier

Mozul emperors.

Painting received a great impetus through the patronage and conneisseur-ship of the three Mogul emperors, Humasing of the three most emperor, assumption, Akbar, and Jahangir. Humayin, lather of Akbar, spent some years of exile in Persia, and on returning to his throne he brought with him Persian painters who influenced the Hindu school. Painting has had a long tradition in I. Mention has already been made of the Ajanta freeces. Mural paintings of great merit also survive from the sixth century in the caves of Bagh, nearly 300 m. N. of Ajanta. These appart, however, and except for some MS. illustrations of the medieval schools of painting in Bengal, Nepal, and Gujerat, little survives from the centuries before the Mogul era. Mogul pointing is mainly miniature work but derives from Persia and not from the traditional style of Ms. painting. Akbar had a number painters working for him, many of them Hindu and many whose names are known. Subjects chosen were portraits of men of the time and scenes chroneling events. W, influences were also telt. Gradations of tone, effects of light and shade are features of Mogul painting. In this it is distinguished from the work of the painters of Rajputana, Bundelkhand, and the Himalayan Punjah, Rajput painting derived from the traditional mural art and was devoted to illustrating the stories of legend and religious epic. The colouring legend and religious epic. The colouring is mostly flat. The two styles often interis mostly flat. The two styles often inter-mingled but in the best work are dis-tinguishable. Mogul mainting declined during the reign of Annungaelie who discouraged the arts for religious reasons. Raiput painting continued into the eighteenth and nineteenth centuries and centred particularly in Japur. Later Raiput painting is seen at its best in the Pahari art, named from the hill country of the Punjab where it flourished. It was divided between the schools centred at Jammu and Kangra. Kangra painting is Jammu and Kangra. Editori painting is graceful in line and soft in colouring. In the nineteenth century it declined although portrait painting was encouraged by the Sikh rulers of the Punah. As the century advanced W, influences weakened many of the distinctive features of Indian art, but in the early twentieth century a movement in recognition of the artistic heritage of I. in which the Tagore family was prominent, brought about a renalssance of the arts; Dr. Abanindranath Tagore has given a unique display of Ajanta ar motif in brilliant paintings. In Bombay a contemporary school of art sought to assimilate European influences. especially Fr. Among modern Indian painters and sculptors may be mentioned Shabani Charan Guil, K. Krishna Hebbar, and Chint anoni Kar.

and Chint mont Kar.

Indiagher, Lake, see ENARE.
India House, the name by which East
India House, demolished in 1861, the
headquarters of the old East India Company, in Leadenhall Street, was known.
Prior to such occupation the Company
transacted its affairs from 1621 to 1638,
in Crosby Hall, Bishopsgate. The modern
I. H. which is situated in Aldwych,
London, was opened by the KingEmperor and Queen-Empress in July
1930. The new building was the outcome of proposals submitted by Sir Atul
Chatterice himself, Lord Irwin's Gov.
ultimately accepting the project, and the ultinately accepting the project, and the Legislative Assembly voting the sum of 2324,000 for erection and equipment. The building is essentially Indian in provenance; its purposes are not exclusively official, but are also directed towards providing a London home for India. It is the work of Sir Herbert Baker, who had much to do with the building of New Delhi.

Indiana, N. central state of the U.S.A., generally known as the 'Hoosier State,' the second to be erected from the old N.W. It covers an area of 36,291 sq. m., 305 of which are water-surface; and its greatest length and breadth are respectively 277 m. and 145 m. It is bounded on the N. by Michigan, on the S. by Kentucky, on the E. by Ohio, and on the W. by Illinois. The state lies in the Mississippl valley and in the besin of the Great Lakes, and is well watered by sev. streams, Lakes, and is well watered by sev. streams, of which the most important is the Washash. The greater part of the surface is undulating prairie land. The fertility of the soil is largely increased by a system of under-draining. Agriculture is the prin. industry, 91 per cent of its total area being farms; the chief crops are corn, wheat, oats, hay, and rye. Barley and maize are grown, as also is tobacco. Large quantities of tomatoes and other vegetables and fruits are grown for the regetables and fruits are grown for the mrkts, and exported, and the rearing of livestock has increased in recent years. The chief mineral productions are coal, petroleum, limestone, sandstone, building the coal of the production of the production of the productions are coal, petroleum, limestone, sandstone, building the coal of the productions are coal. stones, etc., and natural gas, the chief field of which is in Delaware county. The production of pig-fron is considerable, and production of pig-iron is considerable, and the clay-working industries are important—these yield bricks, tiles, pipes, pottery, etc. Other manufs, include fron, glass, carriages, railroad cars, woollens, etc. Transport is well provided by the natural facilities of the Ohio and Wabash rivs, and by Lake Michigan; while by land there is a total of 7,187 m. of steam rullway and 2,135.07 m, of electric. Added to this all the lines from the E. to Chicago pass the lines from the E. to Chicago pass of through indiana, and other connections of Lord Dufferin's, and the first meeting with E. W., N., and S., which are of was held in 1885 during his viceroyalty, great importance to trade. The prin. W. C. Bonnerii being the first president. mulvs. are Purdue Univ.; Indiana Univ.; This tirst meeting was attended by De Pauw Univ.; and the Univ. of Notre seventy-two delegates, mostly lawyers, Dame. I. is governed by a General schoolmasters, and journalists. A. O. Assembly consisting of a Senate of 50

Indian Millet, a cereal grass, species of panieum (P. maximum), widely grown in Meditorranean countries and the E. believed to have been the first wild grain to be cultivated. Replaces rice in drier climates, a good bread being made from Also serves as cattle fodder; also called Kaffir corn.

Indian National Congress. The origin of this C. may be set down to a suggestion of Lord Dufferin's, and the first meeting

which was meant to grow into a native Socotra, belonging to Africa, whilst the parliament. At the first C. loyalty to prin. is. in the E. are the Laccadives, England was stressed. The next C., a Maldives, Ceylon, the Andaman Isles, and England was stressed. The next C., a year later, had 440 delegates. The movement was in the beginning essentially Hindu and from the W.-educated classes; the Muslims had little to do with it, the Moslem League Association being their representative body. In 1916 both bodies combined in a declaration for Indian Home Rule, and it was evident that C. had now hear captured by the attentials. had now been captured by the extremists. From about this time it became somewhat overshadowed by the organised Nationalist movement under Gandhi's leadership. Thus the I. N. C. owed its birth to Indians who had been attracted by ideals learnt from Eng. culture and teaching; with their were joined from opposite motives other Hindus whose yearnings were for the past days of Indian glory and who hated European rule. It was from the union of these opposites that the Nationalist movement sprang, which found its fruits in the Brit. declaration of 1917 leading to responsible gay, in India. The goal of the Congress is expressed in their phrase purns swaral, first interpreted as a complete independence but later modified as meaning but craip at will. See further under INDIA—history. See C. F. Androws and G. Mukerji, The rise and growth of Congress in India, 1937; Sir R. Coupland, Indian Politics, 1936-1942, 1943; J. T. Gwynn, Indian politics, 1944; Sir H. Indian Mutiny, see INDIA—History. ing to responsible gov. in India.

Indian Mutiny, see India—History. Indian Ocean, is bounded on the N. by Asia (Arabia, Persia, India); on the E. by Indo-China, Sunda Islands, Australia, and the meridian of the southernmost point of Tusunsuis; on the W. by Africa and the meridian of Cape Aguillas; on the S. by the 60th parallel of lat., but the S. boundary is variously given by different authorities. From Cape Agulhas to Tasmania is some 6000 m., and this is the greatest breadth of the I. O. The two great bays on either side of the peninsula of India, the bay of Bengal on the E. and the Arabian Sea on the W., with its arms the gulfs of Aden and of Oman, belong to the I. O. But the Red Sea and Persian Guif, which communicate with the said arms by the narrow straits of Bab-ch mandeb and of Ormuz respectively, are separate seas. The Pacific Ocean can be separate seas. The Facility Ocean can be approached from the I. O. by means of the channels between the Sunda Is. and the Timer Sea, whilst the Mediterranean Sea in the N.W. communicates with the I. O. by means of the Sucz Canal and the 1. O. by means of the Sucz Canal and the Red Sot. There are two important straits, Mozambique Channel in the W., separating Africa from Madagascar, and Palk Strait in the E., separating India from Coylon. The I. O. is dotted about with thousands of is., some of which are of coral formation, as the Maldive, Chagos, and Cross groups; others, such as the Crosot is, and St. Paul's is., are volcanic. The chief is, in the W. are Madagascar, Mauritus, Bourbon, the Seychelles, and

Nicobar, belonging to Asia. In spite of these innumerable is., the I. O. is mostly navigable. The prin. large rivs. dis-charging thomselves into this ocean are the Zambesi, Indus, Ganges, Irahmaputra, Iranwadi, Godaveri, and Kistna. The bed of the I. O. attains to a depth of about 2000 fathoms in some parts. The mean temp. of the surface water is over 80° F. in all parts N. of 13° S. There are two warm currents moving southwards, the Mozambique and Agulhas currents, whilst a colder current in the E., called the W. Australian current, crosses the I. O. moving northwards.

Indian Orders of Knighthood are two in number, the Most Evalted Order of the Star of India, and the Most Eminent Order of the Indian Empire. The first was estab, in 1861, and besides the king and a grand master as the vicercy of and a graind master as the vicercy of India for the time being, was divided into three classes: Knights Grand Commanders (G.C.S.I.), knights Commanders (K.C.S.I.), and Companions (C.S.I.) The badge is worn pendeut from a light blue ribbon, with white stripes edgeways; the collar is composed of alternate links of lotus flowers, red and white roses, and unin branches enamelled in gold, with an palm branches enamelled in gold, with an imperial crown in the centre. The mautle worn is of light blue satin, lined with white. The motto is: 'Heaven's light our Guide.' The Order of the Indian Empire was instituted in 1877. In addition to the sovereign (grand master) and the vicercy for the time being, there are three classes in the order; Knights Grand Commanders (G.C.I.E.), Knights Commanders (K.C.I.E.), and Companions (C.I.E.). The badge is hung from a purple riband, and the collar is composed of elephants, peacocks, and Indian roses. The motto is Imperatricis Auspiriis.

Indian Pink, see PINK-ROOT. Indians of America. See AMERICAN INDIANA.

Indian Shot, or Canna indica, best-known species of the order Cannacce, and is to be found in all tropical countries. The plant receives its more resemblance of its seeds to shot. The seed resemblance of its seeds to shot. The rootstocks are very large, spongy, and jointed, and are used in Brazil for poultiess in tumours and abscesses. The rootstocks of some of the other species of Canaa are more valuable, yielding the starch called tous trs mois.

Indian Summer, season of mild weather on the Atlantic Coast and in the Central States of the U.S.A. usually occurring in Oct. or Nov., but sometimes in Doc. The sky is cloudless, the atmosphere hazy, and the temp. extremely mild. The tendency to extreme dryness causes a number of forest and prairie tree. This summer corresponds to what is known in England as St. Luke's Summer, which occurs at the end of Oct. or the beginning of Nov.

indian Territory, formerly a ter. of the U.S.A., about the size of Ireland. It lay

W. of Arkansas, and was separated from Texas by the Red R. This country was such censed to exist, especially reserved for the Ludian tribre by the gov of the U.S.A., and was assigned to them by Act of Congress in Commonwealth Relations Office, Div. B 880 The ter. contains furthe prairies and rich valleys, and is crossed by a large large large forms about 40 m. vide large large forms about 40 m. vide large large forms to be to forms about 40 m. vide large forms in chamber, see Rubber. broad belt of forest about 40 m. wide called 'Cross Timbers.' The climato is very pleasant and salubrious, and agriculture and cattle rearing termed the chief occupations. Indian Ter. was occupied by five tribes : the Cherokees, the Creeks,

indicator, term in chemistry to denote a substance used for the disction of minute amounts of materials. Commonly, the word is applied to those bodies that indicate an acid or alkaline reaction. One of the most frequently used Is. is

A CONSTRUCTION CREW OF CHOCAW INDIANS WORKING ON A STATE ROAD MEAR MUSICOGLE, OKLAHOMA

settled central ter. to the Union as the state of Oklahoma in 1907.

India Office, Brit. Gov. dept. set up in 1853 to administer the affairs of India. Its political head, the secretary of state for India, was assisted by an undersecretary of state. The I O, estimates were met from ludian Gov. funds. Prior to 1838 Indian affairs were conducted by the E. India Company, under the super-vision of a gov. Board of Control, whose president was responsible for Indian affairs in Parliament. On the transfer of India to the Crown in 1848 the secretary of State was assisted by a consultative council; this Council cessed to exist only in 1937 when some of its functions passed

the Chocktaws, the Chockesaws, and the littinus, a substance prepared from certain seminoles. Admitted with the white-litchens. This with alkalis gives a blue and with acids a red coloration, and in most cases the colour change is sharply defined. In titrating acids and alkalis, care has to be exercised in the choice of I. for example, in the case of carbonates, fitmus may not be used (unless the titration be performed so that all the carbon divide is expelled, since the latter has a distinct effect upon the L. Similarly, the is prepared synthetically require discretion in their wae, e.g. bhenoi phthalein is an excellent I. for strong acids and bases, but may not be used for the titration of a weak acid by a base, since the end-point is not sharp. Another frequently used I. is methyl orange, which is the sedium salt of an acid, helianthine. to a body of advisers. In 1947, when This is a sodium sait of an organic acid.

which in presence of alkalis is yellow, and in acid solution red It is however, phthalem in the free state, is represented necessary that the acid should be strong, by the formula otherwise no sharp end point can be obtained. Of other natural is may be mentioned cochine al and extracts of red cabbase and other vegetables but the greater number of the more recent pro-ducts by long to the benzen series

Much has been written corcerning the theory of in hectors with a view to ex-plaining the change of colour that occurs according to the scartion of the solution The first adequate explanation was offered by Ostwald who i used his views upon the ionic theory of clution (q v) According to this view an acid is a substance which in iqueous solution yields free hydrogen ions and conversely an alkali is one which yields free hydroxide ions Consequently a solution which con tains ions of 'n drogen and of hydroxyl in equivalent (mounts muy be regarded as This condition is realised in the ncutral case of pure water, which is only slightly dissociated into its component tons Further a strong acid or a strong base is one which in squeous solution is strongly dissociated On the other hand a 'weak sold ir is one which in solution is not dissociated to any great extent but remains non amused the assumption made by Ostwald in his theory to account for the behavious of Is is that the latter are either weak acids or weak bases, and that the change of coloni is due other to the presence of the non ionised substance or of a coloured ion. In the case of phenol plth den it is supposed that we are dealing with a weak and colourless and in the terms of the dissociation hypothesis, this is only disso clated to a slight extent and any nurse see in the concentration of hydrogen ion-such, for example, as takes place if a strong and be present tends to diminish the dissociation. In consequence, there is no colour change. If however, an alkalı such as sodium livdrovide be added the hydroxyl ions associate or combine with the hydrogen lons of the I, leaving cations of sodium and the anions of the I. The latter in this case are supposed to be coloured, and therefore the colour change is manifest Methyl orange acts as a very is manifest. Methyl oring aste as a very weak base, yielding in solution ted cations and small numbers of hydroxyl ions (OH), the undissociated substance is yellow. On addition of an acid the hydroxyl ions of the latter combine with hydroxyl ions of the latter combine with undissociated part of the 1 then ionises so that the red colour of the cations is seen. Addition of alkali on the other hand, suppresses the ionisation of the I which the refer shows the villoy colour. which therefore shows the yellow colour of the undissociated molecules. In addi-tion to the above theory there has been proposed a so called chemical explanation depending upon the structural differences existing between the lactoid or coloured form. It has been assumed that all coloured substances possess the guinonoid. structure (see QUIVO'R), and one view of the change of colour of is. is based upon

phthalem in the free state, is represented by the formula

its acidic properties being due to the testi of a phenolic (i.e. OH) group On treatment with alkalis, a change in structure occurs, and the salt is regarded as having the tollowing constitution—

where I is a univalent metal (The double bonds (a) and (b) present in the mole us are characteristic of the quino noid tructure) This latter view is in agreement with Hantech's theory of pseudo acids and pseudo bases, and is not entirely antagonistic to Ostwald's disso ciation by pothesis

A 1 1go tange of Is is now available, so that it is usually possible to select a suit able one for indicating any desired conable one for indicating any useries con-centration of hydrogen ions (see Hydro-centrol to Concentration). A universal in letter is a matter of various Is made in in such a way that it shows a series it colour changes over a large range of hydrogen ion concentration Universal Is are extremely useful in applied and techn il chem for the rapid estimation of hydrogen ion concentration

External is are sub-tances that are used to determine the end point of a reaction but must not be actually introduced into the reacting mixture since they would either cause undesirable hings or would be obscured by the are usually placed in drops on a white tale and areps of the reacting mixture are ron wed from time to time with a glass rod and added to the I on the tile, when the clour changes may be noted I have scene. Is an substances which

indi ite variations in hydrogen ion con entration by changes in the colour or intenty of the fluorescence they omit in daylish or ultraviolet light. They are very useful in determining the soldity of

very useful in determining the soldity of coloured or cloudy liquids, e.g. fruit juloss Indiction, term used in chronology to denote a period of lifteen years. The meaning of the word originally signified the imposition of a tay but it gradually crept into the calendar of historians, principally occlesiastics to mark time, thus, in the Middle Arcs, the dates of charters were expressed in is as well as in years of the Christian cra. The papal I, which has alone survived, was reckoned as starting Jan. 1, 313.

indictment, in criminal law, is a written ; accusation against one or more persons accusation against one or more persons of a crime preferred to, and presented upon oath by, a grand jury. All treusons and felonies, misprisions of either, and misdemeanour of a public nature at common law (e.g. seditious riots) are punishable on 1. The following is an example of an I. for larceny: 'Kent to wit: The jurors for our Lord the King upon their acts present that Blahard Lorge and their oath present that Richard Jones on the 1st day of Muy, in the year of our Lord 1901, four sacks of cont, of the gonds and chattels of William Hirst, feloniously did steal take and carry away: against the peace of our Lord the King, bis crown and dignity.' The formal parts are: (1) the commencement, the prin. leature of which is the venue or place from which the grand jury is drawn, and, generally, where the crime was committed; (2) the name of the accused; a missomer will be cured by the defendant pleading to the L; (3) the time when the offence was committed, but time is not material ex-cept where of the essence of the offence. as e.g. burglary, which must be between 9 p.m. and 6 a.m.; (4) description of the facts and circumstances essential to constitute the crime: an omission of an stitute the crime: an omission of an essential ingredient of crime is not cured by plea or verdict; (5) the places may, in some cases, be required to be stated; in others the venue in the margin (see the form), or co., or other div., is deemed to be the place for all facts set forth in the L.: (6) conclusion—errors in the formal cou-clusion will not vitiate an I. An I. may contain any number of counts, but not more than one offence can be charged as a rule in the same count. The object of including more than one count is to charge the accused either with different charge the accused either with different offences, or a previous conviction, or with being an habitual criminal (see CRIMINAL LAW), or to describe the facts of one transaction by different terms, so that if on the evidence they do not sustain one charge they may another. For example, a count for larceny is very often accompanied by a count for receiving As a rule, it is against the policy of our criminal law to charge different felonies in different counts, i.e. as opposed to charging different species or aspects of the same offence or transaction; and, as a rule, a count for a feliny is never joined with a count for a misdemeanour. Different misdemeanours may be charged in different counts, provided all the acts were sub-stantially one transaction, or constituted transactions essentially similar.

Indies, East and West, see EAST INDIES

and WEST INDIES.

Indifferentism, philosophical term, denoting the conception that all things in life are of indifferent value, being out-side the moral law. I. in this sense originated with the Stoics, who, in comoriginated with the Stoles, who, in common with the Cyplica and the Sceptics, held that only virtue and vice possessed absolute value, all qualities other than those two being indifferent. With the Middle Ages, the term came to have a second meaning, especially as it appeared in the teachings of Adelard of Bath. With him

I. came to mean the philosophy that life is either particular or universal, moral or immoral, according to the point of view from which it is regarded. Values can, therefore, only be indifferently related to any idea of absolute value. Kant used the term 'indillerent' as meaning extramoral, but I. has come now to be used simply to denote a negation of all values which in life, it is supposed, cancel each other out, leaving no balance of absolute right or wrong.

Indigestion, see DYSPEPSIA.

Indigirka, riv. rising in the Stanovo' highlands of Yakutsk in E. Siberia, and

highlands of Yakutsk in E. Siberia, and dowing into the Arctic Ocean. Length nearly 1000 m. Indigo, naturally-occurring dye-stuff obtained from various plants. Chief among these are species of Indigofera (e.g. I. sumatrana, from which the Bongal I. is prepared). I. is also present in the juices prepared). of Isatistinctoria, or the woad plant, which was cultivated in England until quite recently for the preparation of a fermentation vatused in I. dyeing. I. occurs in the form of a glucoside, known as indican. and this latter, on exposure to the influ-ence of atmospheric overen and a ferment present in the leaves of the indigo-bearing plant, is converted into the insoluble blue, indigotin, which is the essential principle of 1. The preparation of natural 1 is carried out as follows: the plant is cut down, steeped in vats for about twelve hrs. and the extract, which is of a greenish colour, separated and run into fresh vats, where it is stirred vigorously, so as to bring the indican into contact with the atmospheric oxygen. Insoluble I. is precipi-tated as a mud, which is collected, pressed, dried, and cut into cubes. Various components other than indigotin are present, the most important being indirubine, or indigo red, indigo green, and indigo brown.
The importance of natural 1. as a dyestuff has greatly diminished during the last few years owing to the perfection of various synthetic processes for its manuf. The success of these has been in large part due to the work of Adolf von Baeyer, who, by a series of masterly researches, eluci-dated the constitution of the dyestuff, and showed that it could be correctly represented by the formula

I, is now manufactured by a process shown in the outline in the diagram (page 47a). The synthetic product is considerably cheaper than the natural, and the traction of indigo are manufac-tured annually, particularly in Great Britain and the U.S.A. Many other dyes related to I. in composition have recently been discovered, though they do not yet rival I. itself in importance, DYES AND DYEING.

Indigo Bird (Cyanospica cyanea), small bird of the finch family, native of the U.S.A. It is about 5½ in. long, the adult father confessor. The relationship is a male is of a beautiful blue colour, whilst delicate one and depends much on indithe female and young are of a bluish-grey. I ridual personalities. On the whole, it It has a sweet song, something like that of

a canary, and frequents open spaces.
Indirect Rule, form of native administration which is characteristic of the Brit. tradition of colonial rule in the African colonies and also in Brit. Malaya (up to the time of the modern Foderation of Malaya). The principle of I. R. is that native institutions are the most appro-

delicate one and depends much on indi-ridual personalities. On the whole, it works well in this colony. Though the principles of I. R. are in accord with Brit. political sentiment, the actual evolution of the system has been more or less fortuitous; and it was the existence in tyanda of a well-developed political organisation in Buganda, and in N. Nigeria, of the Muslim emirates which herilitated the use of native authorities in facilitated the use of native authorities in printo agencies of gov. rather than any a way which could not have been consystem which seeks to transplant into the templated if experience had been con-

DIAGRAM OF THE PROCESS OF MANUFACTURE OF INDIGO

colony a replica of European political institutions. Conformably to the Brit. sense of trusteeship (see COLONIAL TRUSTEESHIP) and imperial experiences the policy of I. R. affords to native peoples not only an opportunity for self-development, but the possibility of adjusting themselves with the possibility of adjusting themsolves with the least avoidable disturbance of their own way of life to the novel conditions which by contact with the white men they now must meet. N. Nigeria is the original, and classical, example of I. R. which was devised by its conqueror and first governor, Lord Lugard (q.v.), nearly half a century ago. That sytom with but slight modifications persists there to-day. The typical political unit is the prov., in which the chief executive authority is a which the chief executive authority is a Muslim emir. To him a Brit. resident, who is the instrument of higher policy. acts as adviser, and in some cases as The most effective means of inducing

fined, e.g. to the backward societies of S. Nigeria or the weak political units of some parts of Brit. E. Africa. In the latter, however, in Tanganyika, Sir Donald Cameron rendered valuable services in extending the system of I. R. as he himself had helped to develop it in N. Nigeria. Nor, again does the system owe its origin to any preconceived theory of rule any more than does its opposite, direct rule: for all European govs, have been con-fronted by the problem of administering large colonial areas with a small European staff mostly ignorant of native custom and language, and in all cases they have been compelled, at least in the earlier days, to make use of chiefs or other available native authorities.

There has been much controversy over the relative merits of I. R. and direct.

native opinion to accept salutary innovations is the end sought in the system of 1. R., which relies on the appeal to the respect of a people for its own leaders, and its pride in institutions which it can call its own. The system of direct rule, on the other hand, considers rather how best to make quickly effective the decisions of superior authority, and sees its most effective agency in the council system, or in the training of chiefs as subordinate agents of the executive gov. In the Union of S. Africa the form which native administration has taken has been dictated by the conviction that Bantu development must be regarded chiefly in relaopment hust be regarded then in reaction to the place which the native must occupy in a society dominated by European institutions—hence the policy of segregation.' It is, therefore, understandable that S. Africa should prefer a system of direct administration in native system of unret administration in harve affairs, and should rely on the council system as the best for native areas with organs of local gov. It is also evident that the traditional authority of 1. R. would not be suitable for adoption as an agency for managing the large native pops, resident in the urb, centres of the Union of S. Africa. In S. Rhodesia the system of direct rule, though it rests in system of direct rule, though it rests in principle on the same basis as in S. Africa, is less developed, notably in the matter of suitable tribunals. Although the liberal provision made for native lands is a prominent feature of S. Rhodesian policy, the Dominion has not yet evolved a com-prehensive scheme for the regulation of netive affairs. Kenya colony, on the other hand, has in operation a fully-developed system of native administration founded on the creation of dist. councils presided over by an administrative officer, with native courts consisting of ad hoc nominated members. The adoption of this system of direct rule is not due to any assumption (as in S. Africa and in the Fr. Mrican colonies) that the welfare of the African colonies) that the welfare of the native lies in his rapid assimilation of the use of 'civilised 'institutions; but rather to the fact that the Kenya Gov. had no sufficient confidence in the traditional authorities to justify their exploitation whether as judicial tribunals or as agencies of local gov. But it is claimed for the Kenya system, not unjustly in the cir-cumstances, that it is the best adapted to a colony where Africans were continually in close contact with Europeans and also that it provides opportunities for educated

natives to take a part in local gov.

In the Fr. African term, the adoption of a system of direct rule was deliberate. Whereas Brit, sontiment favours the setting up of institutions which afford a training in the arts of self-gov, besides holding out the prospect of autonomy in the future, this forms no essential part of the Fr. theory of colonial administration. The Fr. goal is not native independence but a progressive association with Fr. methods of administration and with Fr. economic and social institutions. It is natural that, in this scheme of native development, the traditional indigenous institutions should not appear to have the

intrinsic value which the scheme of I. R. assigns to them. It is claimed, not with-out some justification, that this sytem gives the metropolitan administration a more efficient and more easily controlled agency for development than any other system to be found in operation in Africa, especially as the chiefs are now an educated class trained at one of the chiefs' schools. ('rities, however, of the Fr. system think that it is not to the Africans' own interests to pass as rapidly as possible from the use of his indigenous institutions and of his own language to a regime of Fr. civilisation and language. They hold, too, that the operation of the system must inevitably prejudice the development of a spirit of responsibility and initiative. the Belgian Congo the system of nativo administration is in a state of transition. The gov. is as convinced as the Brit, that a traditional chief can render better service to the administration than one who is appointed (as they are in some of the Brit. E. African colonies); but the Congo Gov. is not yet prepared to give the chief either the same judicial authority or the same position in local gov. as would be assigned to him in Brit. ters .- like the Fr., the Belgian Gov. has less hesitation than the Brit. In romoving their chiefs. More-over, with the exception of the Ruanda-Urundi, the Belgians have encountered few traditional authorities who have commanded a wide measure of support among their people.

In both lift. W. and E. Africa the prevailing policy is still that of 1. R., but is encounted ing ever more criticism. In W. Africa there has been no European colonising enterprise and consequently less direct impetus towards the development of responsible self-gov. than in E. Africa (especially Kenya with its relatively large European and Indian pops.); but the principles of I. R., 'if not necessarily incompatible with the avowed ideal of solf-gov, by representative institutions'—the tendency to-day is towards greater African (elected and nominated) representation in the legislative councils— are so far alien to it as to presuppose considerable modifications of native institutions before they can it into any scheme involving an elected parliament' (Lord Halley). Fr. policy on the other hand does not envisage a future self-gov. for their colonies; development in their case is regarded as adapting the colony to occupy in reality the position now assigned to it in principle as an integral part of France. This is emphalsed in the definition of the constitutional and logal status of the overseas dept. and ters, within the Fr. Union (see France,—Constitution).

The finante loyalties of the African have signed to it in the resulting the crop with in trade of visit in the resulting the crop with the position of the African have shown the control of the control of the crop with the position of the crop with the position of the constitution of the crop with the position of the principal ways to the position of the principal ways to the position of the position of the principal ways to the position of the principal ways to the position of the principal ways the position of th

The innute loyalties of the African have always been to his tribe or vil.; loyalty to the larger organisation which the white man has created can be built up only gradually. The use of the innute loyalties to introduce the idea of self-grv. was, as shewn, above, the essence of the fruitful principle of I. R., but the last ton years have seen a silent revolution of imperial policy, as a result of which the days of I. R. seem to be numbered. There are two

necessities of the coming generation for meant inseparable; cf. Paradise Lost, iv., which I. R. cannot provide. By the first 406, 'an individual solace.' Later it was principle of Brit. imperial rule the purpose used, as opposed to the word collective to of the suzerain power is to make available to the colonial peoples the characteristic benefits bestowed by gov. upon its sub-jects at home-that is, to-day, the mani-fold services of the welfare state. But as a method of administering social serwices the traditional tribul system of Africa is hopelessly inadequate. Secondly, the future political system must offer scope for the natural aspirations of Africans who, after contact with European political thought, expect as a general right those opportunities of public service and advancement which in the tribal system could only fall to them by the accident of birth. These two necessities, that of the carrière ouverte our talents and that of the large-scale administration dictated by the economics of the social services, in themselves mean the eventual doom of I. R. Yet the system cannot be hurried to exits own restraints upon power, variable yet always substantial—the restraints of custom, in which the system itself was rooted. All over colonial Africa these are now passing. The country restraining element cannot come solely from dependence upon a popular franchise. loyalty comparable to that evoked by the old tribal system must be engendered. Hence the efforts being made by the Brit. Colonial Office to educate Africans in selfgov. through participation in both legislative and executive responsibility at the local level. The test of their success will be the development of a true loyalty to social units of a national scale; this is the great problem that challenges the emancipating imperialism of the twentieth century. See Lord Lugard, The Dual Mandale in Tropical Africa (1th ed.), 1929; H. B. Thomas and R. Scott, Uganda, 1935; Sir R. Winstedt, A History of Malaya, 1935; L. S. B. Leakey, Kenya Contrasts and Problems, 1936; M. Perham, Natire Administration in Nigeria, 1937; C. K. Meek, Law and Authority in a Nigerian Tribe, 1937; R. Emerson, Malaysia: a Study in Direct and Indirect Rule, 1937; M. R. Dilley, British Policy in Kenya Colony (anti-imperialist the great problem that challenges the Policy in Kenya Colony (anti-imperialist Polery in Kenja Coomy (anti-imperialist polemic by an Amer. authoress), 1937; Lord Halley, An African Surrey, 1938; Sir D. Cameron, My Tanganyika Servee and Some Nigeria, 1938; M. Wight, The Gold Coast Legislative Council, 1947.

Indium, rare metallic element which occurs in certain specimens of zinc-blende. and resembles aluminium and thallium in its properties. Its symbol is In, its atomic number 49, and its atomic weight 114.8. It is a soft white metal, unseted on by air or water at ordinary temps... but on heating it burns to its sesqui-oxide with a blue-violet flame, which gives two characteristic lines in the indigo

part of the spectrum; hence its name. Individual (Late Lat. individualis, that which is not divided), originally denoted a thing indivisible in substance: Milton in his Animadegraions speaks of the individual Catholic Church. Hence, it also

nieau pertaining to a single person, as in the phrase 'individual effort,' or to any-thing of a striking and original character. In colloquial speech it is often used as a noun to denote man or person.

Individualism, see ANARCHISM SOCIALISM.

Individual Psychology, see under Psycho-LOG V.

Indo-China, or Farther India, also known as Chin-India, S.E. peninsula of Asla, extending southwards into the Indian Ocean. It comprises Tongking, Annam. Fr. Cochin-China, Cambodia, Laos, Siam, the Shan country, Burna, and Malacca. See under all these names, and also Lypo-Curva, Expression.

and also INDO-CHINA, FRENCH.
Indo-China, French, name under which
were incorporated the Fr. colony of
Cochin China, the Fr. protectorates of
Touking, Annam, Cambodia, and Upper
and Lower Lace, and Kyangolautyan and Lower Laos, and Kwangchau-wan, leased from China. Even before the Second World War Fr. Indo-China was in practice a federation of the Fr. colony of Corbin China, with its own governor, and of native states with varying forms of gov. After the capitulation of Japan (1945), when France resumed her relations with Indo-China, the political institutions with Indo-China, the political institutions had changed: a republic had been founded in Tongking which sought, by force of arms against the Fr., to exercise its authority over Annam and to extend its influence to Cochin China. The mechanism of the Fr. administration, mechanism of the Fr. administration, destroyed by the Jap. invaders, was only purtially re-estab. by the returning Fr. authorities (1945-46). Cochin China had ceased to be a colony under direct Fr. administration; a local gov. had been constituted and France was represented by a Commissioner of the Fr. Republic. Following a conference at Fontainebleau (Sept. 17, 1946) France appears to have recognised the formal status of the native republic of Viet Nam, comprising Annam and Tongking, but subject to that republic forming part of the Fr. Federation public forming part of the Fr. Federation of Indo-China. Before the entry of the Jap in 1911 the whole of Fr. ande-China was under a governor-general, whose seat was at more a governor-general, whose seas was at Hanol (Tongking) and who was assisted by a secretary-general. Each protectorate had, as its head, a resident-superior, but Cochin China, being a Fr. colony (represented in the Fr. Chamber by one Deputy) was administered by a governor. There was a Grand Council for Economic Affairs and a Gov. Council for the whole ter., and also a Grand Council for Economic Affairs for each state. In the protectorates, matters concerning natives come before a native tribunal, and a Fr. court tries matters affecting Europeans. In Cochin China, Fr. magistrates are responsible for justice to both Europeans and natives. Before the Second World War there was a military force of three divs., and a naval force of sloops, gun-boats, and surveying ressels.

Though Annam lies in the torrid zone,

Tongking on the whole enjoys an excellent climate. The heat, however, in June and China. Thus, from the time of Jules July, is sometimes almost intolerable. Ferry the Fr. steadily pressed their conplants abound in the mts. of Annam, and much fishing is carried on. Rice is the chief crop of both Annam and Tongking. Hindu States, decadent outposts of the mannament of Camballa mediate and Tongking. The products of Cambodia include rice, The products of Cambodia include rice, naize, beans, sugar, cotton, tobacco: also silk and pepper. There are schistone forest-clad tracts in the N.E., producing teak, bamboo, and other valuable timber, and in the N. and W. there are mts. containing fron, limestone, phosphate, sapphire, sandstone, and some copper. The prin, native industry is salting and prin. native industry is saiting and smoking fish left in ponds when the Great Lake empties, and which is filled up by the overflow of the Mekong R. The total value of Fr. imports in 1939 was 2382 million fr. and of exports, 3495 million. Of the exports France normally took nearly one-half. The univ. of Indo-China, situated in Hanol, was organised in 1917. Area and pop.: Cochin China, 24,000 sq. m., pop. (1926) 4,616,000 (cap Saigon, 111,000); Annam, 58,000 sq. m. pop. 5,660,000 (cap. Hue, 40,000); Tonkin(g), 43,000 sq. m., pop. (1940), 9,261,000 (cap. Hanol, 135,000); Cambodia, 67,550 sq. m., pop. 3,046,500 (cap Pnom Penh, 103,000); Laos, including Luang Prabang, 100,000 sq. m., excluding Luang Prabang, 90,000 sq. m., pop. 1,000,000 (cap. Vientiane, 10,000). Total 23,585,500 (including 41,000 Fr., 436,000 Chinese). million fr. and of exports, 3495 million.

Chinese). -It was owing to the work of Historu.missionaries that Fr. influence began in S.E. Asia. Siam was the first place in which it was felt, and from there it gradually spread to Tonking and Annam in the seventeenth century. Cochin China, the original colony, did not come under Fr. influence antil 1861, and then only as an indirect result of the Anglo-Fr. punitive expedition of 1860, which cul-minated in the sack of the Winter Palace at Peking. Angle-Fr. co-operation in this, the second China War, prevented this, the second chinas vial, provide seizure of Chinese ter, by either; but ill-treatment of Fr. and Sp. missionaries in Cochin China gave a pretext for a France-Sp. expedition, and after the Sp. with-drew, the Fr. admiral stayed on at Salgon, offew, the st. admiral stayed on at Saigon, administering the land through naval officers. This, the so-called 'rule of the admirals,' marked the true foundation of France's Far E. Empire and the real beginnings of Indo-Chine. A protectorate was then estab, in Cambodia (of recent years considerably expanded at the ex-pense of China). The Revolution more or less retarded progress and the Third Republic was opposed to further expansion. But Jules Ferry, Prime Minister from 1882 to 1885, determined to give France an empire in spite of herself, and backing up the adventurers on the spot, set out to acquire all Indo-China. Annam, Tongking, and Cambodia were united into a customs union in 1887. From 1893 to 1896 France gradually annexed Cochin (blina the Brit, had a hard task to portions of Siam E. of the Mekong R., and in 1900 the ter. of Kwangohau-wan, on the troops which had received part of their

Indian expansion; Annam and Tongking, Chinese in civilisation and sympathy. It was in these Indo-Chinese protectorates that Paul Bert, greatest of Fr. colonial miliators, founded the system of indirect miliators, founded the system of indirect rule, or association, later applied also in Morocco. The native rulers were preserved and all gov. was in their name; native law was modified, not abolished; and industry was promoted without expelling the cultivator of the soil. In a word, Indo-China was the greatest and most successful part of the Fr. overseas empire. It was surrendered to the Jap. during the world war in 1941. The Jap. had long recognised the strategic importance of Fr. 1-C. (The most important strategic points are Salgon, Cam-ranh and Halphong.) A submarine base was under construction at Cam-ranh in 1940, in order construction at Cam-ranh in 1940, in order to avoid the long, enclosed passage to Saigon. When France collapsed in 1940. Saigon. I-C. fell under the Fascist influence of the Vichy Gov (see France--llistory) and in July 1941 this gov., apparently unable to resist Ger. pressure, yielded to Japan's demand for bases in Fr I-C. At the end of that mouth a force estimated at 40,000 was landed, the intention of the Jap. being, evidently, to attack the Burma Road (q.v., and also Burma, Second World War Campaigns In).

During the Jap, occupation the Court of Hué (Annani) supposed that it would benefit by being of good terms with the invader, and the mandaring followed its example. A desire for independence on the part of the immature Annamites lay at the root of the violent and unjustified criticism of Fr. administration, for even to-day the whole of Indo-China still needs the technical, financial, and cultural help of France. But with the Jap. in general occupation it proved easy for the revoluin the inland regions, which were not effectively corupled by the Jap. The most important of these parties was the Vict Mush (an abbreviation for the name Viet Minh (an abbreviation for the name of the League for the Independence of Annum) of nationalist and communist tendencies. After the Jap, surrender, the S. part of I-C. was occupied by the Brit. and the N. by the Chinese. Probably the Annumtes believed that the Fr. were to be excluded permanently. They did not wish to become vassals of China. Hence they proclaimed their independence. The revolution broke out in Tongking, where a provisional gov, was constituted where a provisional gov. was constituted under the presidency of Ho Chi Minh, chief of the Viet Minh. From that moment the political situation became very confused, the authority of the Hanoi Gay, being the property sets. Gov. being insecurely estab., while in Chinese coast, was placed under the arms from the Jap. and were still, in some cases, commanded by Jap. officers and gendarmes. In Tongking the disorganised administration resulted in floods and famine. In Cochin China most of the inhab, wished their country to remain independent of Annam and Tongking or the Vict Nam Republic and the Fr. to continue the work they had begun. In Cantinue the work they had begun and the vorb-stem and the vowel-gradation, known by its Gor, term Ablaut.

Zend. safeth. These two groups are distinguished from one another by thoir treatment of certain guttural sounds. The calum group (Gk., Lat., Celtic, Germanic) has k a kh and ab where the people, who had remained staunch friends of France throughout the war. As regards Tongking and Annam, a provisional agreement was concluded (March 1946) with the ment was concluded (March 1946) with the Ho Chi Minh Gov., ensuring the pacific return of the Fr. troops in the larger transand maintaining the autonomy of those countries within the Indo-Chinese Federation and the Fr. Union (see France, Constitution). There was, however, bitter fighting between Viet Nam and the Fr. throughout most of 1917. Offers of sottlement made by the Fr. (Sept. 1917) were relocated and military consultant parantic. rejected, and military operations began in Tongking (Oct.) Further attempts to reach a settlement concerning the defence and foreign relations of the newly-formed Federation of Indo-China wore unsuccessful (1948). The Viet Nam republic, while ful (1948). The Viet Nam republic, while not objecting to membership of the Fr. Union, looked for the autonomy characteristic of membership of the Brit. Commonwealth. See P. Doumer, L'Indo-Chine Françuise, 1915; M. Happ, L'Immense Indo-Chine, 1928; T. E. Emis, French Policy and Developments in Indo-China, 1936; S. Levi, Indo-China, 1931; Virginia Thompson, French Indo-China, 1937; N. Smith, Burna Road, 1910.

Indo-European Languages. This term, first employed (in 1813) by the gifted physician, Egyptologist and philologist, Dr. Thomas Young, of Emanuel College, Cambridge, is to be preferred to 'Indo-Germanic,' as it is called by patriotic tier. philologist, or Aryan (so termed by super-philologist, aryan (so termed by super-

philologi-ts, or Aryan (so termed by super-patriotic Gers.), which is now technically reserved for the Indo-Aryan branch (see below). This family comprises most of the languages spoken in Europe and some of languages spoken in Europe and some of those of Asia, particularly the Indian sub-continent. The speakers of these lan-guages have for many centuries been the leaders in the hist, of the world; their literatures are amongst the greatest. The development of these languages has been the most varied and the most rich. the most varied and the most rich. The languages belonging to the three man branches of this family, Germanic, Romanec, and Slavonic, nowadays are spoken by c. 325 million people, c. 2.0 million and c. 200 million respectively. On the basis of a great deal of evidence, philologists have succeeded in constructing the Proto-Indo-European language and a 'family-tree' of the well-attest of Indo-European language. Indo-European languages, although not all the scholars agree as to the place in which one or another of these languages (e.g. Hittite or Armenian) should be placed.

The main features of the L.-E. L., at least in their early stages, are as follows: A word normally consists of three elements, root, prefix, and ending: the grammatical relationships are generally

sub-families, termed from the word 100, in Latin centum (pron. kentum), and in Zend. salem. These two groups are distinguished from one another by their treatment of certain guttural sounds. The centum group (Gk., Lat., Celtic, Germanic) has k, g, kh, and gh, where the salem group (Indo-Iranan, Armenian, Balto-Slavonic, Albanian) generally has 8, 2, k or g or h.

8. 2, k or q or h.

One of the many vexed problems of the Indo-European languages is that of Hittite. The Hittites inhabited Asia Minor and N. Syria from the third to the first millennia B.C., and during the fourteenth and thirteenth centuries B.C. con-stituted one of the chief empires of the Near East. The most important stage in the recovery of the long forgotten enume of the Hittites was the discovery in 1906 07, at Bogaz Koy (Boghaz Keul) the anct. Hattushash, cap. of the empire, of the rich royal archives containing over 20,000 documents written in cunciform (see Cunfiform Writing) on clay tablets. Some of these documents are written in Accadian language, but the bulk is written in Hitlite. This language has been recognised as an Indo-European speech since its decipherment in 1915 by the Czech scholar Bedfich Hrozny. The emment Hitlitologist Emil Forrer, on the basis of 'archaisma' in Hitlite as compared with other anct. L.E. L. has suggested, since 1921, that Hitlite broke away from the parent speech before any of the other known L.-E. L. The Amer. linguist E. H. Sturtevant accepted and developed this suggestion. According to hum, Hitlite and 'Proto-Indo-European' are both descended from an earlier lan-Some of these documents are written in are both descended from an earlier language, by him termed 'Proto-Indo-Hittite. Besides, in Sturteyant's opinion five other languages of Asia Monor, known from various inscriptions or from orations in the Hittite documents, are closely related with Hittite. Apparently all these early Anatolian languages preservo certain features that have been lost in all the I E L Sturtevant, thus, suggests the following family tree .

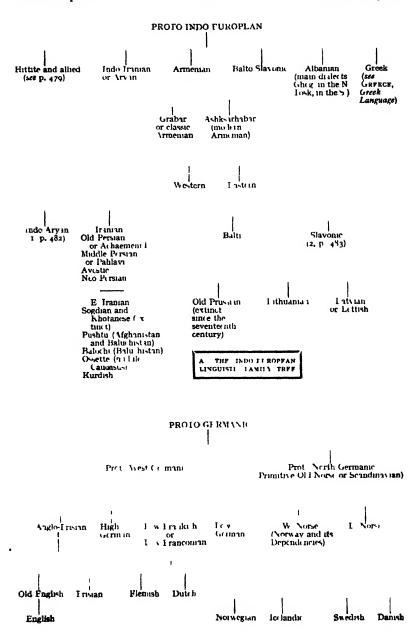

Proto-Indo-Hittite Proto-Indo-European Proto-Anatolian Hittito Luwian Lycian Lydian

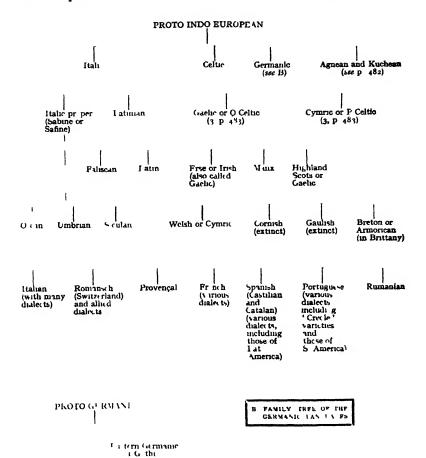

It may be noted that until recently Lycian and Lydian were considered as non-L.-E. L.

Hieroglyphio Hittite

Palaic

Recent excavations and studies have recovered other forgotten languages belonging to the Indo-European linguistic grammatical relationships are generally family. In the first seven or eight cen-expressed by means of inflection; and the turies of the Christian Era, Chinese

Vandalic Visigothu Ostrogothic or W Gothic or L Gothu (see under Gothic Language and Script)

Eastern Turkestan (now called Sinkiang) | almost wholly a sandy waste to-day was a land of smiling cities with rich sanctuaries and monasteries stocked with magnificent libraries,' This anct. 'melting pot ' of peoples of quite different forms of speech, script and religion, is now inhabited by a sparse pop. mainly of Turkish tongue and Muslim religion. MSS, discovered since 1890 revealed that in the latter part of the first millennium A.D., the pop. living between the R. Tarim and the Tienshan Mts., including the ters. of Turfan, Qara-hahr and Kucha, spoke a language belonging to the centum group of the Indo-European family. This language, however, presents sev. features not paralleled in the other L-E. L., and its relationship with the other groups has not yet been sufficiently cleared up. It was assumed, at first, that the new language was the speech of anct. Tokharistan and it was, therefore, termed Tokharian, but apparently anct. Tokharian was a non-Indo-European form of speech. Besides the new language is not uniform; two dialects or languages can be distinguished. which nowadays are termed Agnam and Kuchean. Other newly recovered languages preserved in MSS. discovered in Turkestan, are Khotanese, which was spoken in the anct. kingdom of Khotan, and is now known to have been the easternmost Middle Iranian (or Persian) form of speech; and Sogdian, another E. dialect of Middle Iranian, which was widely used in Ceutral Asia for many centuries, and particularly in the second half of the first milleumum A.D. which nowadays are termed Agrican and half of the first milleumum A.D.

The Indo-European 'family-tree' with particular reference to the Italic and Celtic languages is printed on p. 4.0, with the family-tree of the Germanic languages. Various detailed questions are not taken into consideration; amongst others, the into consideration; amongst others, the problem of the Thrace-Phrygian group of languages, which certainly were Indo-European, but too little of them is known to give them the exact place in the family-tree. Also very little is known about the linguistic allillations of anct. Illyrian, which was spoken on the E. coast of the Adriatic Sea: the Messapii, who inhabited in pro-Rom. times the It-region now known as Apulia; the Piccui, who lived on the central It. coast of the Adriatic, and the Veneti, who inhabited the N.W. coast of the same sea, apparently belonged to the same linguistic group as the Illyrians. Some scholars consider Armenian and Albanian, which apparently are isolated independent branches of the Indo-European family, as remaints of a large group, termed Thraco-Illyrian, including anet. Thracian, illyrian and allied languages, anet. Phrygan, and Scythian, to the N. of the Black Sea.

The following are a few major points to

European people of the Indus Valley). Indeed, besides the Indo-European languages, there are various Dravidian languages (see under LINQUISTIC FAMILIES) and Kolarian or Munda languages spoken over the whole of Central India, which are considered as having the Austro-Asiatic common substratum. Even the Indo-Aryan branch is the most numerous and complicated of all the Indo-European branches. In the last conturies B.C., Sanskrit. which was originally a refined form of the language of the 'Madhyadesa' (the Indian homeland), developed into an artificial, literary language, the language artificial, literary lunguage, the language of the Brahman civilisation. For many centuries it was the exclusive literary language of N. India. The Muslim invasion of India after A.D. 1000, followed by the final conquest, towards the end of the twelfth century, extinguished the Hindu political power (revived only in 1947) in N. India, and brought into use the Arabic Exercise script and the Parsine influence. Persian script and the Persian influence on the Indian languages. Roughly about this time, the Indian Prakrits or vernaculars began to develop into literary languages. The most important of them is W. Hindi (71 million speakers): one of its various dialects, Hindustani, which was primarily the language of the N. Doab, Most carried over the whole of India by the Mostems. The literary Hindustani became the modern literary language of India; cirly in the seventeenth century it was already known in England that Hindustam was the lingua franca of India: it is believed that nowadays it is India: it is necessary that increases, as a spoken by some 65,000,000 people, and it is understood by nearly 150,000,000 people. One form, Urdu, which makes a free use of Persian and Arabic words, and employs the Persian-Arabic script, is used chiefly by Moslems and has become the official language of the new State of Paki-stan. The other form, Hindi, is free from Persianisation, and owes more to Sans-krit; it is used by Hindus and is usually printed in the Deva-nagari character, the script of Sanskrit.

Hindi (2),000,000 speakers) has three main di dect. Ewadhi, Bagheli, and Chhattegarhi. The chief languages of the central group are: (1) Funjabl (c. 17,000,000 speakers) also spoken by the Brit. Sikh soldiers. The dialects are W. Punjabl or Lahnda, c. 7,000,000 speakers with twenty-two dialects. (2) Sinthi c. 3,500,000, with a dozen dialects. (3) Rajasthanl, c. 18,500,000 with the dialects of Malvi (1, 100,000), Marwari, and many others. (4) Gujarati, spoken by 11,000,000 people. (5) Kashmiri 2,000,000 speakers whose main dialect is Kashtawari), is the most north-westerly language of this branch. Palari (' of, or belonging to, the mountains') is spoken by c. 2,500,000 people in Supa dalaksha, The following are a few major points to be considered in connection with the Indo-European family-tree.

(1) The inguistic problems of India are rather complicated. Her numerous languages and dialects belong to at least three main linguistic families (without staking account of the still undeciphered written documents of the pre-Indo(divided into sev. dialects) is spoken by c. 50,000,000 people; Bihari (main dialects; Maithili or Tirhuti, Magahi and Bhojpuri) is spoken by c. 40,000,000 Bholpuri) is spoken by c. 40,000,000 people; Oriya, comprising many dialects, is spoken by c. 10,000,000 people; and Assame c. the most E. Indo-Aryan language, is spoken by c. 2,000,000 people.

Only three Indo-Aryan languages are

spoken in S. India, the most important of them being Marathi with c. 19,000,000 speakers; interesting is Konkani, a Marathi speech, over 1,500,000, spoken to the Desirouses colony of diag and sure in the Portuguese colony of Goa and sur-rounding dists., and mainly written in Rom. characters as adapted by the Portu-guese priests; Saura-hiri is spoken by c. 125,000 people, mainly in Madura and Madras; and Hindustani is mainly Madras; and Hindustani is mainly spoken by the Moslems. Sinhaleso (the language of Ceylon), spoken by c. 4,000,000 people, must also be mentioned: although there are still some who maintain that it is essentially a Dravidian language, it is is essentially a Dravidian language, it is generally admitted by serious scholars that it is an Indo-Aryan speech strongly influenced by Dravidian. Finally, itomani, the language of the gypsics, in various parts of Europe and Asia, corprising numerous dialects strongly influenced by local languages, is generally considered as an Indo-Aryan language.

(2) Silavone. The carliest, extant Old Slavone downwarts belong to the end of

Slavonic documents belong to the end of the tenth and to the eleventh centuries A.D. They are coucled in a language termed 'Erclesiastical Slavonic,' or 'Old Church Slavonic' or else 'Pannonian Slavonic' or 'Old Bulgarian,' and are written in the Glagolithic or the Cyrillic written in the Giagolithic or the Cyrillie soripts (see under Alphaber). The modern Slavonic languages can be divided into three geographical groups: Eastern (Russlan, White Russlan, and Ukrauman). Western (Polish, Czech or Bohemian, Slovak, Wend or Serblan, and Lusatian, and Southern (Bulgarian, Serbo-Croatian, and Suvens).

and Slovene).

(3) Celtic. The Celtic branch is com-(3) Celtre. The Celtic branch is commonly divided into two groups of languages, the Gaelic and the Cymric, which, respectively, are also termed Q-Celtic and P-Celtic: In the former group, the 'Proto-Celtic' combination of a guttural with a w-sound (like kw or gu) remains kw changes into p or pw.

Indo-Germanic Languages, see INDO-

EUROPEAN LANGUAGES. Indonesia (Indo- and the Gk. word i fore, an island) is a term sometimes used 1976., an island) is a term sometimes used to designate the E. Indies, comprising Borneo, Indo-China, Java, and the Dutch E. Indies, Johore, New Guinea, Malay, Penang, Perak, Philippine Is., Singapore, Sumatra, and Tongking. Archæological research in I. has been carried out under both Eng. and Dutch supervision. In the Malay Peninsula stone axe-heads of neolithic culture have been discovered. medithic culture have been discovered, but no knives or spear-heads. These instruments were probably made of bamboo, owing to the lack of suitable stone, and hamboo spear-heads are still in use among the Malays to this day. The exploration of Malayan caves has revealed, often within about 4 ft. of the surface, parts of skeletons—remains of feasts, all remingly of extant animals—cord-marked pottery, and ground stone implements. Archeological research has estab. a considerable similarity between these remains and those found in Indo-China. Bronze adze-heads have been discovered in Negri Semblian, and anct. iron tools, probably mining implements, are also found, but are extremely rare. Indonesian art is practically restricted to design, and among the is, very little sculpture ranning, while what there is shows the religious influence of Indian art. Design has found expression in the patterns with which bamboo combs are decorated and also the belts worn by the women, who attribute to them a magical significance. The pottery also is rudely decorated. Gold and silver fligree work, of extreme intrincey, is made in Malay, 'pper Perak, and the Patani States. Filigree work is used to ornament dagger-hilts, rings, brooches, buttons, kris-sheaths, pendants, car studs, and beads, being often coloured a dark red or deep yellow. Button-making is a craft widely practised in I. The buttons are made of silver on which a design has been indented. The back-ground is then filled in with an extremely durable black enamel, which, after firing and finishing, will neither crack nor bend. The enamelling is known as niello ware. also Indonesia (Dutch); and NEO; Dutch East Indies; Java; Sec

Having obtained arms and assistance from the Jap, garrisons the Javanese proclaimed an independent gov. Guerilla fighting broke out in Java and in Feb. 1946 the Netherlands Cov. declared its readiless to recognize Indein Feb. 1946 the Netherlands Gov. declared its readiness to recognize Indonesian independence and to further the estab. of an Indonesian state po-sessed of full purtnership rights within the Netherlands kingdom. The Dutch Gov. also declared that the new 'Indonesian Commonwealth' should manage its domestic affairs in complete freedom through its own cabinet and a demonstrate. through its own cabinet and a democratic legislative body in which Indonesians would hold a majority. Formal diswould hold a majority. Formal dis-cussions initiated in Java, through the mediation of Sir Archibald Clark Kerr, mediation of Sir Archibaid Clark Kerr, were continued in Holland, where, however, they made next to no progress. Law and order were estab. In Java, however, as the number of places taken over by Brit. and Dutch troops increased. The ters. of the 'Great East,' Borneo, Bangka and Billiton were handed back to the Dutch E India administration (July 13, 1946) and a conference was convened by Llent Governor Gangeri vaned by Llent Governor Gangeri vaned vened by Lieut-Governor General van Mook (July 16) to enable the is, outside Java and Sumatra to discuss their future relationship with the Netherlands Gov., the real purpose of the conference being to check the Republican' (laim to speak for the whole of 'Indonesia,' Resolutions, however, were passed in favour of a federation of the whole of Dutch Indonesia with the maximum of autonomy for each of the four constituent states-Java, Sumatra, Borneo, and the Great East. In the meanture Dutch Indonesian negotiations had been long suspended but in Nov. the two sides agreed on terms of settlement embodied in the 'Cheribon Draft Agreement, a political accord as it was described by the Dutch Gov, which was initialled by both sides on Nov. 15.
This agreement for the formation of the 'United States of Indonesia' held out an illusory promise of a now era of pear e and co-operation, for there were those on both sides who were opposed to any com-promise. In Holland, ey the ('atholic and Calvanst parties were strongly opposed to any concession to the claims of a secular Asiatic nationalism. The Agreement was, nevertheless, signed by both sides on March 25, 1947, and a truce agreement which had been concluded in Oct. 1946 was formally implemented by a cease-tire order, which however, did not stop acts of violence by separatist move-ments in W. and N.W. Java. On May 27, 1947, the Dutch commissioner general in Java sent a Note to the Indonesian Republican Gov. demanding that the gov. be reconstructed to form a central apparatus of the future Federation and that organs be created for co-operation with the Dutch Gov. in regulation of foreign relations and economic questions and the control of

relations with all parts of Indonesia not belonging to the republic. The republican gov. agreed to co-perate but blauned the Dutch Gov. for the continuation of hostlittes. The Indonesian promice (Sjahrir) was unable to got the support of his own Socialist party for the acceptance of these proposals and resigned. The next day President Sockarno announced his acceptance of the general lines of the Dutch Note and the new premier (Sjahrifuddin) also agreed to the proposals.

But the republicans failed to keep law and order in the areas nominally under their control with the result that Dutch troops then occupied all republican build mgs and public services in Batavia. Van Mook's defence of this action was that the Republicans were unable or un willing to honour other the truce or the willing to honour other the blue of the agreement or to liberate the 100,000 per sons (Chinese, Indians, Dutch, etc.) still concentration camps. The gathered in concentration camps. The Dutch forces made rapid progress in occupying areas in N.F., and central Java. and on July 21 President Sockarno broad cast an appeal to solve the problem with out war saving that the republican gov, were prepared to put their case before the United Nations. On the request of the Indian Gov. through Paudit Nehru, the Indian Gov. through Paudit Nehru, the Indonesian case was taken up by the Security Council (July 31) and a United Nations' committee was sent out to report. The committee put forward proposals (Dec. 25) but these were rejected by the second of by both sides. During 1943 it continued to be the aim of the Dutch to create a United States of Indonesia that would be both stable and independent, and to that end they made plans to setting up an appropriate federal constitution. But they could not secure the co-operation of the republicans, nor did any greater measure of success attend the efforts of the United Nations' Good Offices Committee, which remained in Indonesia for many months. The Dutch Gov. con tended that they had suffered provocation at the hands of the republicans and that the subversive forces inside the republic would, unless promptly suppressed, ondanger the whole foundation of the United States of Indonesia. This contention, however, gained no support from the United Nations any more than did the Dutch offer to seek a ruling of the Court of International Justice on the Security Council a competence to intervene in what the Dutch is garded as a domestic dispute. No compromise seemed possible, for the Dutch case and that of the republicans were poles asunder: the Dutch argued that the development of the Indonesian Federation was threatened by the un-willingness of the Republic to join with the other Indonesian states as an equal partner, whereas the republicans, as alwars, wanted a unitarian state under republican control. This forced the Dutch gov. to press for a speedy solution of the problem and, accordingly, on Dec. 19 the Dutch, in violation of the truce which had been arranged by the Good Offices Committee, resumed military action against republican ter. Jokjakarta

was quickly captured by airborne forces and Dr. Soekarno and sev. republican ministers were arrested. By Dec. 30 all major this, were in Dutch hands, the whole major that were in Dutch hands, the Whole operation having been eleverly planned and executed. These military operations were, however, strongly condemned by most members of the United Nations Security Council. In Jan. 1949, the Gov. of India Invited the govs. of thirteen Asian countries to a conference in Delhi to consider the Indonesian problem— Pandit Nehru describing Dutch action there as 'unabashed aggression.' The conference, held on Jan. 23, made firm but moderate recommendations to the Security Council of the United Nations, among them being that all Dutch troops should be withdrawn from the whole of I. by a date to be determined by a United Nations' authority and that power over the whole of I. should be completely transferred by Jan. 1, 1950 to the United States of Indonesia, whose relationship with the Netherlands should be settled by negotiations between the two parties. After discussions lasting sev. weeks, a preliminary agreement was rewhed preliminary agreement was rowhed (May 8) between the Dutch and the Indonesian Republican acceptions which met at Batavia under the auspices of the United Nations committee for Indonesia. The proposals under consideration were the return of the Republican gov. to Jokjakuru, the cessation of all guerilla warfare, and a round-table conference at the Hague. This compromise seemed to be the first step on the road to a settlement of the Indonesian question.

GARDENING.

Indore, native state of Central India in the dominions of the Maharajah of Holkar. It covers an area of 9900 sq. m., and is It covers an area of 9900 sq. m., and is bordered S. and W. by the ters, of the Bombay Presidency, and N. and E. by those of Scindia and the rajabships of Dhar and Dewas. It is traversed in the S. by the Satpura range, and in the N. by the Vindhya Mts., and between these are the dists, watered by the Nerbudda. There are some fertile plains, and most of the country is well wooded. The prevailing religion is Mohammedan. The chief products are wheat, timber, tobacco, raw cotton, and opium. The chief tn. and cap. cotton, and optum. In order to, and cap, is Indore, situated in a fine undulating plain. It has a new first-grade college, a Sanskrit College, sev. high schools, and a scheme for compulsory primary education is estab. A Botanical Institute for the improvement of cotton has been estab., and a number of spinning and weaving mills. Other places of note are the old garrison this, of Mhan and Mehidpur, Mhoysur, and Mandlesar, and the ruined mills. Other places of note are the old garrison that, of Mhan and Melidpur, Mhoysur, and Mandlesar, and the ruined city of Mandu. The present Mahurajah, who succeeded to the throne in 1926, on the abdication of his father, Maharajah Tukoji Rao III., was educated at an Eng. school and Oxford. He married, in 1924, the daughter of the Junior Chief of Kagal. The maharajahs have shown great loyalty to Britain, and during the two world wars I. gave all the help it could to the Brit. Gov., both in money and mon,

who fought on many fronts. There is a state railway, with the prin. station at Indore tn., and sev. other railways cross the country. State savings banks have been introduced. The ann. revenue is £300,000. Pop. (1941) 1.514,000.

Indorsement, writing on the back of an instrument something relative to and affecting the transaction evidenced by the or chaque payable to order operates to transfer the right to payment to the indorser or person to whom the indorser hands the bill or cheque. The I. of a negotiable instrument may be in blank, i.e. where the name of the indorser only is written on the instrument, the effect being that the instrument becomes payable to bearer; or 'conditional,' i.e. the property or conditional, i.e. the property in the instrument is transferred subject to some contingency being fulfilled; or 'qualified,' i.e. which enlarges, restricts, or otherwise qualifies the liability of the mdorser; or 'special,' where the name of the indersee is inserted; or 'restricts the appropriation of the indersee is inserted; or 'restricts the state of the proportion of the indersee is inserted; or 'restricts the appropriation of the indersee is inserted; or 'restricts the appropriation of the inderse is inserted; or 'restricts the appropriation of the inderse in the inderse inderse inderse inderse in the inderse ind tive,' i.c. it restricts the negotiability of the instrument to some particular purpose or person.

Indra, in Indian mythology, the ruler of the bright firmament who stands at the head of the heaven of the gods. In Vedic poetry he is represented as performing wonderful deeds for the benefit of good men, at the same time possessing all the attributes of a warlike god

Indre, dept. of Central France, lying S. of the dept. of Cher, and covering an area of 2664 sq. m. It was formed in 1790 from parts of the oil provs. of Berry, Orleannels, Merche, and Touraine, and is named from the riv. Howing through it. The surface consists of a large plateau divided into three dists. viz. the Boischant, a well-wooded plain abounding in marshes in the S., comprising nearly seven-tenths of the entire area; the Champagne, a fertile dist in the N., producing cereal crops; and the Breune in the W., between the ther and crouse, a region of moors, marshes, and ponds, formerly unhealthy, but now considerably inproved by means of drainage and afterestation. The Champagne dist. afterds excellent pasturage for sheep, which produce first-rate wool. The chief products are chestnuts, grain, the vine, sugar-beet, wheat outs, potatoes, turnips, etc. Much poultry is also reared, amongst the prin. manufs, are paper, leather, cloth, and pottery. The dept. is heather, cloth, and pottery. The dopt. is divided into the arrons, of Châteauroux, Le Blace, Le Chatre, and Is-ouden. Châteauroux is the chief tn. Pop. 2.2,000.

orchards and vines between the Loire and Vienne: the billy and unproductive plateau of Ste. Maure; and the marshy ter. of the Breune. The chief products ter. of the Breune. The chief products are grapes, apples, beetroot, grain, and homp, and there are manufs of paper, slik, rope, and bar-iron. Mecalithic monuments are numerous in the dept. The dept. is divided into the arous, of Tours, Chinon, and Loches. The chief tn. is Tours. Pop. 319,600.

indri (Indris brevicaudata), sub-family of the Lemuridae, large monkey-like of the Lemuridæ, large monkey-like lemurs inhabiting Madagascar, especially the E. coast forests, first discovered 1780. They are black and white in colour, of diurnal habits, and live chiefly on fruit.

See LEMUR.

Induction, Eng. Church ceremony for giving possession of a benefice to a clergyman. The I. is performed after a mandate from the bishop to the archdeacon (or dean and chapter). The inductor takes the clergyman's hand and lays it on the key of the church door. The clergy-man is then admitted, and tolls a bell as a public notification to his parishioners. The incumbent's powession is completed by 'reading himself in,' reading the Thirty-nine Articles, and making formal vows to accept them and conform to the rules of the Church. Scottish ministers are or-dained by the Presbytery ceremony. The ceremony which includes a laying on of hands, is conducted by the 'Moderator,' the clergyman appointed to look after the

church during the interregnum or vacancy.

Induction, in logic, the process of real inference, or the proceeding from the known to the unknown. This operation of discovering and proving general proposi-tions is contrasted with deduction, which is the method of applying general proposi-tions once discovered to such particular cases as are considered to be within the scope of the estab. propositions. The great exponent of deductive principles. Aristotle, neglected I., and only identified it with a complete enumeration of facts. Bacon's Norum Organum contains little true I., though it contains directions for drawing up the various kinds of lists of instances. Whewell's Philosophy of the Inductive Sciences (1840) marks a distinct advance, and shows a due appreciation of the cardinal point neglected by Bacon the function of theorising in inductive research He shows that science advances only in so far as the mind of the inquirer is able to suggest organising ideas whereby experiments and observations are made to dovetail into an intelligible system. J. S. Mill in his System of Logic, ratiocinative and inductive (1843) ignores the constitutive work of the mind, and regards knowledge as the merely passive reception of impressions. Recent advances in mental science have estab. the great importance of femal clearly show that the mental science have estable the great importance of i., and clearly show that the most valuable faculty in scientific inquiry is that of suggesting new and valuable hypotheses. See also Logic. See J. S. Mill (above) and A. Lalande, Les Théories de l'induction et de l'expérimentation, 1929.

Induction and Induction Coil, see Fractivities. ELECTRICITY - Electro-Magnetic Induction.

Induction Furnace, see under METAL-LURGY (METALLURGICAL FURNACES).

This term, in Rom. Cathindulgence. This term, in Rom. Catholic theology, signifies the remission of the temporal penalty of sin, grunted to a repentant sinner by Church authority. The I., however, is nover considered a sacramental remission of the sin itself. Although the first recorded instance of the use of the word indulgence was in the eleventh century by Alexander II., the institution was found in full development during the wars of the Crusades, the serving in which was accounted an equivalent substitute for penance, provided always the service was from motives of devotion and not from mere greed or love of glory. Later, military service as a condition for is, was replaced by pilgrimages to certain great shrines. I.'s may be given by the Pope, and by primates and bishops within the limits of their jurisdiction. In modern times they are usually attached to works of devotion or good works of any kind in the form of remission of part or all of what would have been the old canonical penance for sin.

Indulgence, The Declaration of, issued by James 11. of Great Britain in 1687. It had for its ostensible object the suspension and for its extension object the suspension of all laws tending to force the consciences of the king's subjects—its real object being to rehere the Rom. Catholics. It was very unpopular, and the culminating point of the universal disastisfaction was tended in the heartest of the control of the control of the second of the testified in the refusal of the seven bishops to order their clergy to read it aloud from

their pulpits.

Indus, S. constellation between Grus and Puvo, first noticed by Bayer in his Uranometra, pub. in 1603. The chief star (of 3.2 magnitude) gives a solar spectrum. Near by are the clusters of Tucana and Telescopium.

Indus, great riv. of N. India, rising in the Kailas mt. group, near the sources of the Brahmaputra, Sutlel, and Gogra. For upwards of 500 m. it flows in a N.W. direction: at first by the foot of the Himalayas on the Tibet plateau, then through Kashmir, between the chains of Ladakh in the N., and of Zanskar in the S., amid mt. scenery unmatched by any in the world. Here it receives the waters of the Shyok, the largest trib. of this its upper course. As it leaves Kashmir to enter the l'unjah it turns to the S.W., and emerging from the mt. regions is joined at Attock by the Kabul R., from Afghanistan. From this confinence it continues to run in a S.W. direction for another 1000 m. till it enters the Indian Ocean. About the middle of the Indian Ocean. About the middle of this lower course through the plains it receives one great affluent, composed of the united waters of the Sutlej, Chenab, Ravi and Jhelum, which, with the L. itself make the five Rivers or Funjab. It loses much water from passing through desert regions, but is navigable up to Attock at all seasons. During the melting of the mt. snows, from May to August, destructive floods often occur. It is spanned by sov. bridges, even in its uppor mt. courses—the iron railway bridge at Attock and the cantilever 'Lansdowne Bridge' at Sukkur being triumphs of Year

Typical figures of direct causes of acci- | dents in Brit. factories are as follows (percentage of total accidents for 19471: power-driven machinery, 16-7; molten metal or other hot or corrosive substances. metal or other not or corrosive substances.
4.4; hand tools, 9.9; struck by falling body, 8.8; persons falling 12.0; stepping on or striking against objects, 7.0; handing goods, 29.2; other causes 12.0.
These figures show that what are known as non-machinery accidents accounted for 83 3 of the total.

An important statutory reform in the law of Compensation for I. A. was intro-duced in 1946 when on July 26 the royal assent was given to the National Insur-ance (Industrial Injuries) Bill, framed by the Churchill Gov. to place compensation for industrial accidents on the basis of a contributory social service. Under this Act the basic rate for injury benefit for 100 per cent disablement is 45s, with the right to claim an addition of 25 per cent to his modical assessment if the worker can show that by reason of his injury he is no longer able to fill his previous occupation or be retrained to fill an occupation of an

equivalent standard.

Consult' The Human Factor and Industrial Accidents' (International Labour Iterator, 1926); Industrial Falique and Effi-

taken as meaning both practical convenicace and beauty. The main functions of the council are to help industries to set up design centres which operate on a cooperative basis, supported by contributions from the firms in each industry, with the addition of a grant from the Ex-chequer, to hold and take port in exhibi-tions, to publicise good design both independently and in collaboration with those adult education and voluntary associations which are concerned with design appreciation; to co-operate with calication authorities and others in the training of industrial designers; to advise Lov. depts, on the design of goods which they purchase; and to be a centre of advice and information on all matters of advice and information on an matters or industrial design for industry, gov. depts., and other interested bodies. The in-dustrial div. of the council offers manu-ica theres, designers, and interested bodies a general advisory service or the promotion of improved industrial design: the information divinctudes rections which offer specific services to educational hodies of every kind, to industry, and to the public. The others are at Tilbury House, Petty France, London, S.W. 1. Industrial Diamonds, see under Dia-

Industrial Diseases, see Industrial knowledge and belief has been properly Welfare and Occupational Diseases. Industrial Hygiene, see under Hygiene, and Industrial Mygiene, see under Hygiene, and Industrial Insurance. In its beginning

Industrial Insurance. In its beginning I. I. consisted of 'burial societies' through which the working classes, by payment of small weekly sums to a mutual society, received sufficient money to defray funeral expenses when the need arose. From these comparatively obscure societies the great business of I. I. of today devoloped. A demand for whole-life insurance followed the modest requirements of burial funds, and this demand was satisfied by the innovation of premiums which could be paid weekly or monthly and the issuing of policies for smaller assured sums. These premiums are collected at the houses of the policy-holders, and it is this 'collection,' coupled with the weekly or monthly payments, which distinguishes I. I. from ordinary insurance, where promiums are usually paid annually for larger assured sums. The otheral limit which marks insurance as industrial is that the premiums must be collected at intervals of less than two months, while the sum assured must be less than £1000. This demarcation was embodied in the Act of 1923. Associated with the I. I. companies are the Friendly Societies: the adminiss are the Friendly Societies: the authinistration of both is governed by the statutory measures of the same Act, and the Industrial Assurance and Friendly Societies Act, 1948. All such companies must be registered and pay a substantial deposit to the Chief Hegistrar, who has authority to hear and judge disputes arising out of claims, criticise balance-sheets, hold inspections, reject unsound valuations, and even direct the winding Industrial Assurance Act of 1923 was further extended by the I I, and Friendly Societies Act of 1929 which is concerned that the companion of the I I and I was a support of the I I and I was a support of the I I and I was a support of the I I and I was a support of the I I and I was a support of I with the computation of the minimum sum payable at death under the age of ten, and (2) the validation of the life of an-other endowment invarance. But important amendments of the law were made by the Act of 1948. This Act Geetion 6) contains a prohibition of insuring money to be paid on the death of a child under ten or, in other words, it prohibits insuring so as to render any sum payable under the insurance on the death of any person at any time before he or she attains the arc of ten years (otherwise than by repayment of the whole or any part of premiums paid) of the whole or may part of premiums paid). This prohibition also applies to registered or unregistered friendly societies or trade unions. Hy section 2 power is given to insure the life of a parent or grandparent for not more than £20, but only in respect of a person who at the time of the proposal is ordinarily resident in Great Britain; and the Act prohibits alienation of such insurances. The former power conferred on I. I. companies (and friendly societies) to insurance for funeral econerred on 1.1. companies (and Friendly Societies) to insure money for funeral expenses is also abrogated by the Act; while, by another provision, liability on policies will not be restricted on grounds of health of the person upon whose life the assurance is taken out, if the proposers

Like many other Brit. institutions, in-dustria. life insurance has completely changed its purpose during its existence, besides being radically reformed. It began, as implied above, in the desire of every working-man to guard himself and his family against the danger of a pauper's grave. It was to permit the inclusion of the family that Parliament allowed in this sphere alone the insurance of the life of another-an exception to the general and salutary rule that no one might insure and singly rate that no one night risings on as to benefit financially from another's death. With the payment under the National Insurance Act, 1916, of death benefit as from July 1, 1949, the whole original cause of 1. I. comes to an end. Some thought that on the principle of cessante ratione cessat lex the institution of I. I. should be ended. But its potentiali-ties for good in the future should guarantee its continuance, especially as the worst abuse has been removed by the Act of 1948. I. I. to-day has been transformed into a flexible system which enables the wage-erner (already compulsorily insured so as to guarantee him a minimum standard of living in all the changes and chances of life and a decent funeral when he dies) to assure for himself and his family all those infinitely various benefits at various monetary levels which he desires and for which he is willing to pay. The main remaining criticisms of f. The main femalining criticisms of 1. 1. to-day are its relatively high cost and the number of forteitures. No fewer than 910,000 policies were forfeited in 1918, but this was a great improvement on 2,610,000 in 1938 and 3,160,000 in 1929. It may be added that the size and importance of 1. 1. are shown by the fact that the institution draws appually mass that the institution draws annually more than £110,000,000 from the pockets of wage-carners.

As administrator of the Industrial Assurance Act of 1923, the Chief Registrar of Friendly Societies is styled the Industrial Assurance commissioner (Offices: 17 North Audley Street, London, W.). See Ann. Reports of the Industrial

Commissioner.

In the U.S.A. and Canada a similar system of I. I. operates. In the former country the administration is directed by the Gov. of the separate states, and not by the Federal Gov., while in the latter con-trol is vested in the Dominion Gov. under the provisions of the Dominion Insurance

Act of 1927.

and Industrial Provident Societies which can be registered under the Industrial and Provident Societies Acts of 1893-1928 are those formed to carry on any industry, business, or wholesale or retail trade authorised by the rules, in-cluding dealings in land. To a certain extent the rules of registration and general statutory regulation of these societies are assimiliated to those of friendly societies (see under FRIENDLY SOCIETIES). Modern I. and P. S. are divisible into co-operative and building societies. (See also BUILD-ING SOCIETIES). The primary character-istics of an I. and P. S. are indicated by the description: 'Industrial' connotes the making of a profit by the mutual personal exertions of the members, while 'provi-dent' emphasises the providing for the future of the members by the distribution of the profits. The history of I, and P. S. shows that it was long before they gained public confidence, or even met with legal recognition. According to Brabrook, they were viewed with mistrust because they became assocated with ever wider schemes enanciated by promoters who probably looked upon them as socialistic organisations. Robert Owen's projects were especially illustrative of this idea. The first legal recognition of co-operatives societies was in the Friendly Societies Act of 1846. The basis of the law of I, and P. S. is now to be found in the Consolidated Industrial and Provident Societies Act, 1893. No member of an L and P. S., other than a registered society, may hold more than £200 in shares. The society must make an annual return of its receipts and exponditure, funds and effects to the Registrar of Friendly Societies. On the application of one-tenth of the members or of 100 where the membership is 1000 or more, the register may appoint an inspector to investigate the affairs of the society. The Prevention of Fraud (Investments) Act of 1939 requires some societies of the investment trust and property type to transfer their registration under the Industrial and Provident Societies Acts to registration under the Companies Act, 1929, and in consequence they must conform to the prospectus provisions of the latter Act; but they are free of the normal companies' registration fees and stamp duties on paid-up share capital. From the passing of the Act of 1929 registration under the Industrial and Provident Societies' Acts was restricted to bona inde 'co-operative 'organisations, including societies' conducted mainly for the purpose of improving the conditions of living, or of otherwise promoting the social well-being, of members of the working classes '--the principle which underlay ing classes—the principle which underlay the old I, and P. Acts although not ex-pressly enacted Before the Second World War there were 5693 registered societies, with a total membership of 9,283,600 and funds of £281,507,000. See under CO-OPERATION.

Industrial Psychology, branch of psychology which investigates the effects, mental and physical, produced by their occupation on workers in the various industries. directed to the climination of causes which lessen industrial efficiency. Among matters which come under review are the duration of working periods, pauses for rost, environment, monotony, meal times, fatigue, lighting, heating, and ventilation. A section deals with vocational tests de-A section deals with vocational tests designed to aid the selection of workers for particular trades or tasks. There is a chair of National Institute of Industrial Psychology which specialises in the study of vocational itiness (Aldwych House, Aldwych, London). There are also a chair of Industrial Medical Psychology in Lion through smalls on undustrial amelioration Univ. and a Group for Research is Industrial Psychology, one of many

units in the Medical Research Council. With the great increase in the use of machines and large-scale production methods, particularly in the textile industry, it becomes of great importance that materials and methods of work and transmit general working conditions should be designed specifically in view of what the greatest possible number of normal people could do with the least strain, fature and threat of ill-health. Machines and working conditions should be designed in the light of a sound knowledge of what the normal human senses, muscles and mind were fashioned and developed to do easily and well.

Industrial

(Britain). Relations Britam, unlike the position in many foreign countries, the relations between em-ployers' and workers' organisations have been developed on a voluntary basis over many years. Collective bargaining be-tween employers and workpeople has for many years been recognised in Britain as the method best adapted to the needs of industry and to the demands of the national character in the settlement of wages and conditions of employment. It has produced a well-co-ordinated system of conventional working arrangements affecting in the aggregate large numbers of work people and defining, generally with great precision, almost every aspect of I. R.

Historical and legislative development of organisations of employers and workpeople. -Organisation of employers and workers grew with the development of modern industry from the eighteenth century. the sixteenth century the State regulated wages and conditions, and at the same workers and of employers from altering wages and conditions of work. But with the mereasing complexity of industry and the div. of labour and wages this State system of regulation fell into disuse, and conditions in the laisser faire economy of the day, were left to be fixed by employers. During the eighteenth century, further aws were passed prohibiting combinations in various trades and, as the result of the report of a parl, committee or inquiry, the Combination Laws Repeal Act, 1824, was passed. This legalised trade societies and the immunity thus granted to combinations for the regulation of wages and conditions led to the widespread forma-tion of unions. This led to disputes and strikes and to agitation for the repeal of the Act of 1824. An amending Act in 1825 limited the actuities of the trade societies, making it difficult for them to take effective action without infringing the law; but the Act legalised the right to withhold labour by collective action, and this fundamental right has never been abrogated despite many changes in the powers permitted to Prade Unions. The

wages and conditions of work. Strikes were frequent from 1825 to 1871. A Royal Commission of 1867 reviewed the position of Trade Unionism, and consequent on their recommendations two important Acts were passed in 1871—the Trade Union Act and the Criminal Law Amendment Act. The Trade Union Act of 1871 is the prin. Act on which the present day status of unions is founded. The Criminal Law Amendment Act qualified the freedom conferred under the Trade Union Act by providing penalties for violence, intimidation, molestation, and obstruction of any person in order to coerce him for trade purposes. Since then there have been many subsequent Acts, supported by been many subsequent Acts, supported by a great body of case law, and the law has been codified. These measures and judg-ments include the Conspiracy and Protec-tion of Property Act, 1873 (see Con-spiracy); the Employers and Workmen Act, 1875, dealing with disputes between employers and workmen arising out of breaches of contract and allowing courts to adjust claims for wages or damages; to adjust claims for wages or damages; the Trade Union Amendment Act. 1876, amending the definition of Trade Unions given in the Act of 1871: the Taff Vale Judgment of 1901 and the consequent Trade Disputes Act. 1906 (see under Trane Unions): the Osborne Case, 1909, and the Trade Union (Amalgamation) Act. 1917 (modified by the Scoleties (Miscellancous Frovisions) Act. 1940); and the Trade Disputes and Trade Unions Act., 1927 (see Trade Unions). A period of trade depression followed the year 1875 of trade depression followed the year 1875 and lasted for two decades during which trade unionism lost some of its strength. Strikes were common and nearly always unsuccessful. The unions confined themunsuccessful. The unions commen them-selves mainly to establishing such rela-tions with employers as would ensure the maximum benefit in wages and conditions to the workers. When this phase passed a new unionism arose with a tendency towards a more active industrial policy and a reversion to the earlier idea of one big Union. But the statutory position of the Trade Unions was unchanged throughout this period, though the historic judgments above mentioned resulted in the further legislation indicated. Since 1868 trade union movement has been centralised in the Trade Union Congress, the objects of which are 'to promote the interests of all its atiliated organisations and generally to improve the economic and social conditions of the workers.' Although the origin and main activities of Trade Unions lie in the industrial field, they have also a direct association with politics because of the connection between the Trade Union Congress and the political Labour Party. A joint body, the National Council of Labour, which is composed of representatives of the General Council of the T.U.C., of the Labour Party, of the Parl. Labour Party, and of the Co-operative Union is responsible for the consideration of ques-

Strikes companies (see COMPANIES, CITY) have 371. A been in existence in Britain since the ved the Middle Ages. These bodies which once dealt in some measure with both trading and labour questions affecting their craft differed materially from employers' organisations under present-day conditions. These employers organisations, like These employers organisations, like most other brit. institutions, have developed to meet particular circumstances and do not conform with any uniform plan. Employers organisations full into three groups: the groups the groups of the conformation fall into three groups: those constituted for dealing with I. R. questions, including collective bargaining with Trade Unions and the avoidance of disputes ; which fulfil that purpose and, in addition, deal with trading questions; and those which deal only with trading questions and which are therefore irrelevant to this article. As regards the first two groups, the repeal of the Combination Laws and the development of Trade Unionism in the nineteenth century stimulated both an increase in the number of these employers' organisa-tions and the expansion of their activities. The extent of the industrial field they cover is estimated at about eight million workers. Some of these organisations are local in character and deal only with a section of an industry; others are national in scope and deal with the whole field of a particular industry; while in many of the chief industries there are local or regional organisations combined into national federations, but the degree of authority exercised by regional organisations over individual members, or by federations over athliated organisations, varies con-iderably. Just before the Second World War there were about 270 national federations concerned with matters relating to the employment of labour and in addition about 1.50 other employers' organisations consisting mostly of local or regional branches of the national federations (an analysis of these 1820 organisations classifield according to industrial groupings will be found in the Abstract of Labour Statis-tics of the United Kingdom (1922-36)). The corresponding total at the end of 1943 was approximately 1900, with the same ratio of local to national bodies. By 1919 there had been formed the National Con-federation of Employers' Organisations (now called the Brit. Employers' Con-federation) to secure the co-operation of the national federations in dealing with all questions arising out of the relations between employers and their workpeople. This Confederation, consisting of federa-tions employing about 70 per cent of the total industrial population of Britain, is the employers' counterpart of the T.U.C. for dealing with labour questions affecting industry generally. In that capacity the Confederation has represented Brit. employers at the annual conferences of the International Labour Organisation since 1919. This Confederation and the T.U.C. have long been recognised as the authoritative channels of consultation between tions which have both an industrial and a gov depts, and organised employers and political implication.

Employers' organisations in the form of merchant guilds (see Guilds) and livery the Second World War the need for the closest co-operation was at once recognised. Accordingly there was estab. in Oct. 1939, a National Joint Advisory Council of fifteen representatives nominated by each organisation. It was agreed that the scope of the Councu's functions was to include all 'matters in which employers and workers have a common interest, while, at the same time it was not to encouch on the prisidiction of organisations concerned with particular industries. In May, 1940, the Council appointed a joint Consultative Committee appointed a Joint Committee consisting of seven representatives of the Brit. Employers' Confederation and the T.U.C. respectively to advise the Minister of Labour and National Service on all matters arising in the period of emergency.

Collective Bargaining and Development of Joint Negotiation between Organisations of Employers and Horkpeople.—In the early days of Trade Unionism the outlook of the Unions reflected both industrial aspirations and political ideas; but by about 1850 they were concentrating much more on the improvement of working conditions. The next stage was the estab. ditions. The next stage was the estable of some agreed relationship with employers' and employers' organisations. Conciliation Bonius, with a form of procedure confined to the treatment of disputes, were set up in many industries; but with the development of industry the scope of this arrangement was widened and by 1900 a pumber of the study indusand, by 1900, a number of the staple indus-tries had adopted the practice of collective bargaining. The term 'collective bar-gaining' is applied to those arrangements gaining is applied to those arrangements under which the wages and conditions of employment are rettled by a hargain in the form of an agreement between em-ployers or associations of employers and workpeoples' organisations; but in un-organised trades the individual workman accepts or refuses the terms offered by the employer without reference to any one class interests than his own. For many years collective agreements have played a most important part in the regulation of working conditions in Britain, embracing a great variety of matters including not only wage rates but also hours of work, piece work arrangements, holidays, etc. The terms and conditions laid down in the agreement are applied not only to members of trade unions but also to non-unionists. Trade agreements are also largely ob-served by employers who are not party to them. This system of collective bargaining includes also agreements regarding the procedure for settling questions as they ariso, and in no other country has so much been achieved towards evolving machinery for the avoldance of strikes and lock-outs. The whole of this collective system rests on the principle of mutual consent. on the principle of inutual consent. This acceptance is purely voluntary depending solely on the sense of moral obligation.

Loyal acceptance has in fact been the rule in all the trades concerned. Certain stops have, however, been taken in the interests of the community to encourage joint voluntary machinery where such does not exist and to assist where necessary in the settlement of disputes. There are two voluntary machinery where such does not laying down that it suitable collective exist and to assist where necessary in the settlement of disputes. There are two main legislative measures, the Conciliation settlement and that the settlement

Act, 1896, which was passed as a result of the recommendations of a Royal Commission of 1891; and the Industrial Courts Act, 1919. In addition, however, much has been done through the conciliation officers of the Min-try of Labour to strengthen and support existing joint to strengthen and support existing joint. machinery and to promote new voluntary machinery as organisation developed in industry (for details see under Arbitra-rios, Concillation in Industry). The first modification of the voluntary prin-ciple was made by the Trade Hoards Act 1909, which set up Trade Boards cm-powered to fix minimum wage rates. This Act was confined to certain unorganised trades where 'sweated' conditions ob-tained, but the Act was extended in operathat year. Again, during the First World War, the Munitions of War Act. 1915, made strikes and lock-outs illegal so far as munitions work was concerned, unless the dispute had been referred to the Round of Ward which dest south the Board of Trade which dopt, could, in general, enforce arbitration, though it was supplementary to the agreements in various industries. Cenerally speaking, however, as the war progressed, arbitration became the practice, and this war-time national arbitration gave encouragement to the regulation of wages on a national basis during and after the war. But deswite the legal prohibition of stoppages of work and the acceptance of compulsory arbitration, there developed industrial intest throughout the country which seems to have had its origin in the shop stewards' moreometrial. movement and the origin in the shop stewards movement and the theory of industrial unionism, notably on the Clyde and in Shetheld. The essence of this theory was devolution of authority to the workshop and the estab. of workers' control therein on militant lines with the ultimate object of securing control of industry generally. As a result of the recommendations of the Whitley Committee's Report there was an extension of the trade board system and the development of statutory machinery for the prevention and settlement of industrial disputes. The Committee laid down as an over-riding consideration 'the advisability of a continuance, as far as possible, of the present system whereby industries make their own agreements and this is still the deciding factor of State pole; in regard to intervention in industrial disputes (see Whillerism or Whitlerism (Councils).

During the Second World War the emphasis on the voluntary principle was maintained as far is possible in the conditions of Employment and National Arbitration Order, 1940. This Order prohibited strikes or lock-outs unless the dispute had been reported to the Ministry of Labour and had not been referred by him for settleteent, and it also provided for the estab. of a National Arbitration Tribunal for dealing with disputes while should have the legal force of an arbitration award.

The voluntary joint machinery for the regulation of terms and conditions of employment has evolved according to the different trades and industries, but the better the industrial organisation the more effective and simple is the machinery of collective bargaining. In the early days of collective bargaining negotiation was generally confined to localities, but in most industries the scope of the machinery has been continually extended until national negotiations have largely replaced local interchanges on industrial questions. National negotiating machinery however varies considerably in form and in degree of authority over the local machinery and, moreover, the trend towards national negotiation does not mean that a national uniformity has been estab, in regard to wage rates and conditions. Variety in the methods of collective bargaining as well as in wages structure is most to be found in industries where the principle of joint negotiation between organisations was well estab. before 1918. There is greater uniformity in industries where joint orgamsation is a more recent development and has been founded on the basis of the Joint Industrial Councils recommended by the Whitle, Committee. Consult Industrial Relations Handbook, H.M.S.O., 1914, and A. Beacham, Economics of Industrial Organisation, 1914. Industrial Revolution in Great Britain,

the compendious description given to the changes brought about in social structure by the inventions of the eighteenth century. In the later part of the seventeenth century Eng. industry had benefited by the immigration of foreign artisans, and many branches of cloth-making were hany branches of clott-making veri-learned from alien, like the Walloons, and slik-weaving from the Huguenots, who ame over in 1655 after the Revocation of the Edict of Nantes. Paper-making, glass-making, mechanical toy-making, and the manuf. of clocks and watches were also among the activities estab. through aliens from the Continent. But the remarkable development of industry, due to the invention of unchinery in the eightcenth century and to the exploitation of the coal mines, dwarfed the preceding progress into insignificance and resulted in a rapid and vast increase of the population and, medentally, led to all the implications of the terrors snown as larsec-faire.

Piner to the era of machinery, weaving had been a cottage industry, while yarn spinning was a spare-time industry practised all over the land by women and girls at home. Then in 1738 came the inventors tion by Kay of Bury of the flying shuttle, which obtaited the old and slow process of carrying the west through the threads of the warp, and so enabled the weaver to double his output, and, in turn, led spin-ners to seek mechanical aids to meet the increased demand for yarn supplies.

'mule,' a combination of Hargreaves jenny and Arkwright's water-frame—all of which inventions were at first applied to cotton-spinning only (see Cotton-SFIN-NING AND MANUFACTURE). Twenty-five years later came Cartwright's power loom in its perfected form, and by that year his Doncaster factory was equipped with a steam-engine, and a year or two after that hundreds of his looms were also selling to Manchester firms, while gradually the power loom was applied not only to the cotton, but also to the woollen industry. The next stride was the general super-session of water-power by steam, a change which came with the utilisation of the coal resource of the country, when James Watt patented his 'Watt' steam-engine. the revolutionary principle of which was the obviation of waste of power by the device of the separate condenser. Watt's various patents were taken out in 1781-85. by which time the change from water-power to steam made rapid progress, and mills and factories were set up near the coalfields, where fuel was cheaper. Later the iron-masters began to investigate the use of coal as a smelting fuel, and with improved methods the output from their furnaces increased by leaps and bounds.

All these inventions led to the climination of the cottage or private worker and to the rapid growth of factories, and with them of the manufacturing ths. of the N. of England. Pop. shifted and concentrated about the conflicted, so that places remote from the fields declined in pros-perity, and from that time agriculture as a national industry suffered permanently. There were necessarily strikes and disorders as the result of these changes, but they were more incidents in the general progress. Pop. increased by nearly 20 per cent in the first half of the century, and Brit, trade and wealth were augmented beyond measure, e.g. exports rose five-told from 1720 to the end of the century. fold from 1720 to the end of the contary, Set J. Industrial Schools, see REFORMATORY ACT-

Industrial Welfare. Since the First World War the question of I. W. has been increasingly important. It is concerned with the examination of the working and living conditions of industrial workers with the object of removing unnecessary hardships and providing unnecessary hardships and providing amenities to mitgate the irksome nature of their work. There are many aspects to be reviewed in such service, including the study of health in industry, and the proper selection of workers for aultable employment. These depts, of I. W. concern the funding of the factory. Outside next important inventions were the spin-ning jenny of James Hargreaves in 1764, such questions as housing, travelling, the the invention of the water-frame spinning visiting of the sick, recreation, stc., are roller of Richard Arkwright, Crompton's dealt with. In a number of irrms, elaborate education schemes have been instisocial education so as to create better opportunities for advancement

The modern movement may be said to have begun as a result of the impeturgiven to questions of health and welfare by the committees act up by the minuters of munitions in 1916 to sufguard the health of munition workers Robert R Hyde, who with Scebohm Rowntres wis in charge of this work subsequently, in 1915, founded the I W society. In its early days much of the work of the to coul miners, and the increasing protein of pit head biths was one of the pits of responsibility as foreign, a per-

professional organisation of personnel managers. While I W is still greatly concerned with health, amenities recrea tion and the like, more recent developments which are likely to continue, have been in the direction of estal lishing joint consultation machinery t tween manage ment and worker and making in effort to see that it works efficiently Works councils, set up to promote co operation between workers and management usu ally include in their functions the idmin sche as Another subject with changes con it i the attention is the letter and

Cal uny Bros, Ltd

AMENITIES FOR THE WORKER A DINNERHOUR SCENE ON ONE OF THE WORKS RECREATION GROUNDS II BOURNVILLE

results Subsequently the work in this TNNS and so on industry was taken over by the Minrs | 10 munds to exten Wellare Committee. The connection be | with is recognised. tween the I W movement and most of the nationalised industries, however, con tinues to by close The emphasis of the work has changed with the years, since many of the provisions for which the I W Society contended in its carly day, as, e.g., holidays with pay, have now been generally accepted in principle, and in many cases either within the national agreements or even incorporated in logis lation Moreover all firms of any size have now their own personnel departments

Attempts have also It n m wie to extend the principle of I W , with his recognised by all the larger firms to the very many small ones, which in the u Lu gate represent su na large proport on of industrial worker- and where welf me provisions are not gratty developed

Both in Britain and in the U - 4 (where I W istermed Industrial Hygiene), vaminations are conflicted on the problems of injury by dust and poisons an i of ventilation an lighting The medical service attacks such mestions as periodi cal examination of w there, the estadental and eve clime, rost-houses for fatigued workers, while sanatoria and with personnel officers trained to handle fatigued workers, while sanatoria and the human problems of industry. The private hospitals are maintained in many fractitute of Personnel Management is the industries. Research is conducted with assiduity and success, and that the movement is justified is proved by the fact that in both countries the days of labour lost by illness have considerably reduced. Modern methods in factory building and layout have of course much influence on the provision of amenities. See also MENTAL TESTS. See Annual Report of H.M. Chief Inspector of Factories; pubs. and jours. of Industrial Welfare Society and the British Indentured Institute of Management; and Cadbury Bros. Ltd., Record, 1919–1939; 1930; and E. Mayo, The Social Problems of an Industrial Civilisation, 1949.

Industrial Workers of the World, organisation of revolutionary labour unions formed and operating chiefly in America. It was founded in 1905 at Chicago, and was the outcome of a meeting of Socialist and trade union leaders. The most prominent of its leaders were E. V. Debs, W. Haywood, W. Trautman and the Rev. T. J. Hagerty. The activities of the I. W. Were generally characterised by extreme violence, and in many states a campaign of attempted suppression was taunched against them, ending in the deaths of Joe Hill in Utah, and Little in Butte.

After the First World War communism absorbed many of the I. W. W. supporters, and organised opposition from the various states caused a further decline. Special laws were passed rendering such forms of

INDUS VALLEY CULTURE:
A stone statuette from Mobenio-Daro

syndicalism illegal, and in 1918 more than a hundred leaders were imprisoned after a trial in Chicago. Moreover, the restrictions imposed by later immigration laws reduced still further a membership hitherto largely maintained or augmented by the

imporation of unskilled labourers. Great Britain minor branches have been formed at London, Liverpool and Glasgow. Indus Valley Culture, term by which is known the anct. civilisation of the Indus valley. Excavations carried out in 1922 at Mohenjo-Daro, a large mound 25 m. S. of Larkana in Sind, revealed the site of an anct. city which had existed some five thousand years before. It appears to have been successively destroyed and rebuilt seven times over a period of perhaps a thousand years from 3500 to 2500 B.C. Other evidences of the civilisation of this time have been thought the appears in the second of the civilisation of the second of the civilisation of the second of th Other evidences of the civilisation or this time have been found at Harappa in the Montgomery dist. of the Punjab. Those two sites, 100 m. apart, and others which have been discovered show that the civilisation was widely spread along the Indus valley. The ruins of the city of Mohenjo-Daro show a more advanced to the civilisation than artified in India state of civilisation than existed in India in much later times. It had affinities with the anct. civilisations of Sumer and Mesopotamia, but although there was undoubtedly communication between them it is not known whether they were independent or whether one was the offshoot of the other. The racial origin of the Indus people cannot be determined with certainty. They lived in well-built brick houses of more than one storey, equipped with baths and drains. They were an artistic people, skilled in pottery, carring, and metal work, using copper, bronze, and silver. Iron was unknown. A number of seals beautifully carved on steatite give representations of various animals, including the buffalo, elephant, sheep, and cainel. These animals were probably domesticated. Herses and cows do not domesticated. Horses and cows do not seem to have been known. No remains of a building have been identified as a temple. Religion seems to have control on the cult of the Mother-Goddess, also of a male god from which the Hindu Siva may have derived some of his attributes. The causes which led to the downfall of the civilisation and the extinction of its cities can only be surmised. It is probcities can only be surmised. It is probable that the prosperous cities were over-run by a foreign invader and the people massacred. See Sir J. Marshall, Mohenpo-laro and the Indus Civilization, 1931; L. E. Mackey, The Indus Civilization, 1935.

Indy, Paul Marie Théodore Vincent d' (1811-1931) Fr. composer, b. at Paris. Member of a noble family of the Ardèche dist. In the Vivarais. His mother died at his birth and he was brought up by his paternal grandmother, a good musician. At the age of eleven he was sent to Diémer for the panoforte and Lavignac for theory, and later studied planoforte under Marmontel. In 1870 he pub, his first composition and served in the defence of Paris against the Frussian army. To please his family he studied law, but was determined to be a musician and went for advice to Franck, who offered to teach him. He also joined Colonne's orchestra as drummer to gain experience. Pasdeloup gave the first performance of one of his works, the overture to Schiller's Puccolomini, afterwards part of his Waltenstein trilogy.

Next to Franck he admired Liszt, with Next to France he admired light, whom he spent sev. months at Weimar in 1873, and Wagner, whose first Ring cycle he attended at Bayrouth in 1876. In 1894 he joined Charles Bordes, together with Gullmant, in founding the Schola Cantagura, the taught them with bla dath torum: he taught there until his death and had many pupils of the highest distinction. From 1912 he also directed the orchestral class at the Conservatoire

His works include sev. operas (including His works include sev. operas (including Ferraul), theatre music, symphonies, chamber see studies by A. Sorieyx, 1914, and I. Valias, 1916; and A. Gabeaud, Auprès du Maitre V. d' Indy, 1938.

Inaboli, scaport of Asiatic Turkev, on the Black Sea, about 70 m. S.W. by W. of Sinope. It possesses a roadstead, and exports wool, mobilir, etc. Pop. 48,000.

Inabriates and inabriates Acts. The term inabriate is generally used to denote

term inebriate is generally used to denote an habitual drunkard. Clinically, drunkenness (q.v.) is no more than a temporary cerebro-spinal disorder induced by the absorption of much alcoholic drink in a short space of time. It varies in form according to such circumstances as the amount of alcohol taken, the state of the stomach, the climatic condition, and the reactions of the individual, and in its psychical effect on the individual there may be many degrees of perversion of the senses, vertigo, and confusion of the intellect. But when and confusion of the intellect. long persisted in, it may result in a diseased condition of the nervous system popularly termed inebriety. The symptoms are a craving for alcohol or an irresistible obsession and impulse to drink (dipsomania). which may be either chronic or periodical mental disorder of a depressive nature characterised by an undefined sadness, uneasiness, and apathy. The only chance of cure is to protect the subject against himself by enforcing total abstinence and by suitable treatment with alkaline bro-mides or other sodatives, or by psychia-tric treatment to resolve the inner conflict which is driving the person to drink. It is now generally recognised that drunkonness is invariably a symptom of anxiety; if the cause can be discovered the symptom will disappear. The In-obriates Acts allow of two classes of institutions: State and certified inebriate reformatories, and hecused retreats. A list of retreats for inebricty will be found in Burdett's Hospitals and Charities (1930). where it is pointed out that any list of Inebriate Homes must necessarily be incomplete: only a few are licensed under the Inchriates Acts, and the majority of unlicensed homes are essentially of a private character with very few patients.

Inebriates Acls. - The object of these

Acts is to make provision for the compulsory detention and special treatment of criminal babitual drunkards in state or certified inchriate reformatories, and provide for the voluntary detention of non-criminal 'habitual drunkards' lu licensed In connection with the Inebriates Acts it may be noted that by the English law drunkenness is no excuse for crime, though where intention is of the es-

an extenuating circumstance; but drunk-enness so far persisted in as to produce delirium tremens, or any other species of alcoholic insanity, renders a person in-capable of committing crime in the eye of the law, though he may be confined as a criminal lunatic. (See further under

CRIMINAL LAW: DRUNKENNESS).
The Habitual Drunkards Act, 1879, enables a co. or bor. council to grant to any person or persons jointly a licence to keep a retreat. One, at least, of the persons to a retreat. One, at least, of the persons to whom a licence is granted must reside in the retreat and be responsible for its management, and the medical attendant of the retreat must be a duly qualified medical man. 'Habitual drunkard' (a term now changed in the later Acts to 'inebriate') in this Act is defined as a person who, not being amenable to any jurisdiction in lun-act, is, notwithstanding, by reason of habitual intemperate drinking of intoxicants, at times dangerous to himself or herself, or to others, or incapable of man-aging himself or herself, and his or her affairs. The Inchriates Act, 1898, which initiated the estab. of these reformatories. gives power to the court, where a person is convicted on indictment for an offence punishable with imprisonment or penal servitude, and who committed the crime while under the influence of drink, to order him to be detained in a state or certified incbriate reformatory provided: (1) The jury find, or the prisoner admits, that he is an habitual drunkard, and (2) the man-ager of the reformatory are willing to re-ceive him. The committal may be either in addition to or in substitution for any other sentence.

Inequality, term in astronomy. sake of convenience the average motion of a heavenly body (supposed to be made in a circle which has the average distance of that body from its primary for its radius) is the first object of calculation when the place of the body at some future time is to be predicted. All the alterations which are rendered necessary by the megnal motion of the planet are called inequalities.

Inert Gases, see RARE GASS. Inertia. Newton's first law, ' That every body perseveres in its state of remaining at rest, or of moving uniformly " a straight line, ercept in so far as et is compelled by impressed forces to chan je its slate, is sometimes called the law of inertia. It has always been easy to understand that force is required to set a body at rest in motion, and the property of I. was recognised from this standpoint by the aucts. It was not until the time of Gables, however, that it was recognised that the same property held true of bodies in motion, and that it was understood that were it not for external causes, a holy in motion would never of itself come to rest. The Moment of Inertia is found by summating the products of every particle of a mass into the square of its distance from a given point or axis of rotation, or expressed as a formula $I = \Sigma(mr^4)$. See Moments.

Inez de Casiro, see Custro, INLZ DE. Intallibility, freedom from all error in the teaching of faith and morals claimed sence of the offence, it may well amount to by the Rom. Catholic Church. The ques-

tion of the I. of the Church has been a sub- necessary consent, and the consent reject of dispute for many centuries, the journed is that of the father if living, and if ject of dispute for many centuries, the dispute centring not in the question as to whether or no the Church is infallible, but in the question as to how and where its infallable utterances were made. The view of the L. of the Church held by the E Or thodox churches is retrospective, their teaching being that all the acts of the councils received in the E. as recumenical are infallible. In the W., the question has been one between the Gallican and has been one between the Gallican and Ultraniontane parties (see Gallicanian), and the latest decision of the Roin Church on the subject was made at the Vatican Council of 1870. This council teaches 'That when the Roin Pontiff speaks excathedra, that is, when he, using his office as pastor and teacher of all Christians, in virtue of his Amstolic office, delines a decirious and the council of the Amstolic office, delines a decirious and the council of the Amstolic office, delines a decirious and the council of the Amstolic office, delines a decirious council of the Amstolic office, delines and the council of the Amstolic office delines and the council of the Amstolic office delines are considered to the council of the co virtue of his Apostolic office, defines a doctrine of faith and morals to be held by the whole Church, he, by the divine assistance promised to him in the person of blessed Peter, possesses that infallibility with which the Divine Redcenier was pleased to invest His Church in the demnition of doctrine on fath or morals, and that, therefore, such definitions of the Rom. Pontiff are irreformable in their own nature and not because of the consent of the Church. No authoritative decision has yet been made, however, to say exactly when the pope 14 speaking ac calhedra, and it is disputed among Rom Catholics as to whether certain utterances are to be regarded as infallible or not is quite agreed, however, that the I does not extend to pronouncements on selen tific and similar matters

Infamy, not now a term of art in Eng. law, but formerly used to denote the loss of status consequent on conviction for an offence involving dishonesty or inhumanoffence involving dishonesty or inhumanity, which loss entailed disqualification as a witness or juror. The prin crimes which involved I were treason, felony, all offences based upon fraud, piracy, sub-ornation of perjury, and common law cheating. But neither past nor present moral heinousness now disqualifies anyone as a witness, thou he the evidence of such a person may well be discredited by a new condensation for the evidence of such a person may well be discredited by a new condensation for the evidence of such a person may well be discredited by a jury, and conviction for our ne does not dis qualify as a juror unices of course, the person consided is actually in prison

Infant, in law, means a person, male or female, under twenty-one years of age The status of infancy in law is of especial impertance in regard to contractual cap to ity and responsibility for cume (As to the effect of infancy on the validity of con the treat of intancy on the vindty of contract ver under Covinaris! An adult who has made a contract with an 1 can not make it void, though the 1, generally appealing can. A majo I at fourteen may contract vialid marriage, and a female I at twelve If two Is. below fourteen and twelve respectively, have morried, they need not remarry after attaining those years, provided they agree to or affirm the marriage that has taken place. Where the consent of parents or guardians is required a pib of banns is void if any one parent or guardian publicly dissents. A licence cannot be obtained by an I. without swearing that he has obtained the circumstances. To amount to murder

dead the guardian or guardians, if no guardians, then that of the mother, if unmarried, and if not, of some person ap-pointed by the court A marriage, however is valid without consent although the parties may incur ponalties, e.g for false swearing. An I husband may be such for his wife's debts contracted before marriage, but would not be liable to a greater extent than the property he may have acquired through or from his wife. For the responsibility of is for crimes, see under CRIMINAI LAW.

Infanta, the Sp. and Portuguese title formerly given to the princesses of the royal family, the eldest princess being also called 'la princesa' It corresponds to 'infante' the title formerly given to the princes of the royal house.

Infant Feeding, see CHILD Infanticide. The practice of I was common to ance nations, prevalent in India, especially among the high casto families of Raiputana, and in China down to recent times, and probably largely practist d among abouginal peoples at the present day. In the customs of savage races, I is closely associated with evoganity, or the custom of marring outside the tribal community female children especially suffered, for among savage tribes they were a source of weakness and danger, since they were useless as fighting units. With nations or peoples of a later date, especially the Hindus, the motives for I were occusionally religious or superstitions, but far more often merely pru-dential. The virtual stamping out in India of this practice—only too glaringly evidenced by the extraordinary dispro-portion of the male to the female population for again it was the females that chiefly suffered—is associated with the names of Jonathan Duman and May, Walker, who initiated measures which culminated in Acts authorising dists whose percentage of female children fell below a certain average, to be placed under police supervision. No less terrible in its incidents was the custom in China, and incidents was the custom in China, and although mitigated by the influence of Christian missionaries, there is reason to believe that it is still practised. As to clossical times, it is curious that the just with necessary (right of life and death) over his children which the Rom, father had till late in the list of Rom, jurishingless, and the analogous night given prudence and the analogous right given to the Ok head of a family, should have prevailed a late as it did in societies otherwl (s) highly intellectually endowed. Among the spiritans, too, there were laws positively enjoining the exposure of deformed children, as, indeed, at an earlier date among the Itoms. The combined effect of the legislation of Constantine, Valens and Volentinan, at a period strongly under the influence of the Christian fathers, put an end to the practhe of exposure and took away the paternal right of life and death. In England intentional or other inexcusable I, is either muider or manslaughter, according to the

it must be proved that the infant was in the legal sense a human being, or, to adopt Coke's phrase, 'a reasonable creature and being.' This means that the child must have completely proceeded in a living state from the body of its mother, whether it has breathed or not, and whether the umbilical cord, or navel, is severed or not. Therefore, killing a child in the womb is not murder, although it may well be punishable under the Acts relating to abortion. But if a child die, after being born allve, as a result of drugs or wounds received while in the womb, such I. is murder. (See also Abortion. Children, Cruellty to, Society for Prevention of: Concealment of Bisth; and Illegithmack.) The Scois criminal law is not dissimilar to the Eng. in this respect. All over Europe, and in some Oriental countries, through the exertions and pecuniary assistance of Europeans, a great deal has been done to prevent I. by the institution of founding hospitals. See J. Peggs, Infanticide's Cry to Britain, 1844; A. M. Cart-Saunders, The Population Problem, 1922.

Infantile Dalegia, see Birth-Paley.

Infantile Paralysis. populier name for

Infantile Paralysis, popular name for acute anterior poliomyelitis. It is a form of spinal paraly is, double confined to one limb and caused by an inflammatory affection limited to the anterior part of the grey matter of the spinal cord. It affects the function of motion but not that of sensation. It is commonent in the earlier time of childhood but is not actually confined to children. The beginning may be unsuspected, or often the onset is preceded by an acute febrile attack lasting some days; but in either case paralysis comes on, at hest, in some cases, very extensively, but later becoming limited to one or other limb or to a group of muscles. The disease is not progressive and, when its limits become clearly defined within a few days of its commencement, recovery, so far as other parts are concerned, may be assumed; but in the paralysed parts incomplete recovery of power is the general outcome (Black's Medical Dictionary). Large epidemics are not a feature of the discase in Great Britain. It was announced in Jan. 1917 that two members of the chem. dept. of Stanford Univ., Dr. Hubert's, Loring and Dr. C. P. Schwerdt, had isolated in a state at least 80 per cent pure the virus of policinvelitis, and thereby had opened the door to experiments for the development of a pure vaccine for use against I. P.

Infantilism, term applied to those conditions when childsh characteristics persist into later life. Where I. is myxedemations, it is due to atrophy or inactivity of the throughput of the throu

generally, or in some special direction. The cause is some constitutional derangement of metabolism, and the condition generally lliustrates the tendency under such circumstance towards modification of the secondary sexual characteristics. Myxagdematons I., or cretinism, is due to the disturbance of a specific secretion, that of the thyrold gland. If the gland is absent at birth, or is congenitally diseased, the sexual characters remain undeveloped during life, and the condition may not be observed until the time of puberty. face retains the chubby appearance of childhood, the voice remains of childish pitch, the second dentition may be absent or abnormal, the genitals are radimentary, and the mental outlook and intellectual activity remain those of a child When the thyroid gland is removed in adults, the resulting condition seems that of a partial reversion to childhood; the mental activities become slower and less complex. the patient is childishly irritable, and there is a marked loss of hair. The treatment of myxo-dema, whether occurring in adults, or as a congenital condition, includes ad-ministration of extract of the thyroid gland, which has been found of particular efflicacy in many cases. I. may also be due to nervous or emotional hold-ups, which can be resolved by psycho-therapy.

Infantry, name given collectively to a intantry, name given conectively to a body of troops who fight on foot and who are armed only with hand weapons. The Gk., Rom., and Gothic armies all had their supplies of I., but the I. in most cases was simply that part of the fighting force which could not be mounted. The mounted men were the chosen warriors, the I. the rank and file. The armies of Greece and Rome were usually composed of more I, than anything else, and the I, fought in close serried masses, and gave by their closeness an added strength and weight to their tactics. The period between the fall of the Rom, empire and the end of the eleventh century was that of the feudal armies, when battles were decided not by I. but by cavalry charges, and the I. of the decasted side were indiscriminately shoughtered. But a change was brought about first by the introduction of the archer, and secondly by the introduction of I. tactics which were capable of overthrowing the feudal cavalry. The battle of Faikirk (1298), between Wallace and Edward I., although it was not a victory for the I., nevertheless illustrates very trongly the new methods. The schilstrongly the new methods. The 'schil-tions' of Wallace, i.e the circles of spear-men, did much to hold the cavalry at bay. The best example, however, was Courtral (1302), where the burghers of Bruges overthrew the foudal army of Count Robert of Artois. Creey was essentially a victory for the new I, tactics. The age of the tendal army was declining; the combination of the resistance of the I, and the shooting of the archers seemed about to give it its death-blow. But the lessons which I. had taught during the Hundred Years' war were speedily forgotten, and cavalry again asserted its superiority. But from this time onwards I. became a defiof firearms naturally enhanced this result.
The period from the opening of the six teenth century proved that the archer was no longer of any great value, and for a time no longer of any great value, and for a time the I were armed in Swiss fashion with long pikes Finally, a combination of I armed with pikes and I armed with gunwas adopted, and as these tactics commanded the enemy both at a distance and at close quarters, for a time, at any rate, the problem seemed solved. The sixteenth the problem seemed solved. The sixteenth century and the early seventeenth was the age of the mercenary soldier. Against untrained rebels this type of soldier was invincible, and nowhere do we find a better example of this than in the pp wars in the Netherlands The Thirty Years' war had great results in the tactics of the I of

and then pouring in a maiderous volley and following this up with a bayonet charge The next great epoch making war, as far as the I were concerned was the Franco Prussian War of 1870 The massed firing tactics were almost entirely relegated to the artillery, and the I, in extend ed order, and taking advantage of overy inch of cover, slowly crept to the attack These methods subsequently underwent some change, especially as a result of the S African War, and later of the Russo Japanese War but the changes did not radically liter the principle and the at tack in ext inded order still remained the basis of I tactics

Recruting and Discipline The head of the other ranks' is the regimental

FAGLISH INFANTRY MEETING THE NORTHN CAVALRY In this panel from the Bayeux Tapestry the infantry are seen with javelin axe and bow

The methods adopted by Gus tavus Adolphus and the Swedes during that war were eagerly imitated by the rest of Europe Fspecially noticeable is it of Europe Fspecially noticeable is it that the arquebus used by the Swedes had been lightened and could now be fired without using a rest At the end of the seventeenth century we find that the old seventeenth century we may that the old pik tactics of the I pass away altogether. Ihe bayonet fixed to the muzzle of the gun took the place of the pike I irc tactics were adopted. The enemy were riddled with fire from the guns at as short a distance as possible, and then when the opposing ranks had been disagnified, the because thereights are not placed the attack.

opposing ranks had been distinated, the bayont charge completed the attack

From the year 1793 can be dated the beginning of modern I tastice. The change was due very largly to the methods of Apoleon, who, having pour d an overwhelming artillery free into the masses of the enemy, brought had I up to complete the attack. It was a combination of the two methods of artillery fire. complete the attack It was a combina-tion of the two methods of artiflery fire and I charges. The I methods of the Peninsular war were on the Brit d some-what different They were meddled on the old plat on free tactics of kiederick the Great, but they combined mobility features to the 1 of the Line. They proand an ability to use cover with the massed
strength of the former Ger type. The fundsh royal exacts consisted in reserving fire until the slows. The standard of recruit is high and
enemy were within easy striking distance, it would appear to be generally conceded

serge int major (warrant officer, class 1) the four company sergeant majors are warrant officers, class 2. Roth classes hold warrants from the Secretary of State bach regiment (except rifle regiments) carries two colours the first is the kings and the second the 'Regimental' Lach regiment of I of the line Lach regiment of I of the line had two battalions in accordance with the had two bittalions in accordance with the "Cardwell System estab in 1891 (See Cardwell, Edward, Viscols) all legiments (except the kings Royal Itile Corps and the Lifle Bigsde) but territorial titles, the majority connected with a unties Before 1881 each right much that a number () is but illon was leaves. always on foreign service and the other at home the rints were partly truned at regimeral dopots situated in the county or rea to which the regiment belonged a in heated by its title. They were then passed on to the Home Bat tall in which ompleted their training and, when required passed trained men on to the battallon in foreign service to keep it up to strength. The Loot Guards are Household tropps, but their organisation and training overspond in their main features to the Loot file Line. They provide weather was a light control of the Line. that the Brit Foot Guarda are the finest I in the world

Changes introduced in the organisation of the L in 1946 to meet the necessities of contemporary warfare altered the Card well system almost out of recognition Under the test of hattle experience the (ardwell system of linked hattalions twice broke down It was found, eg that one brigade of a div on an over-cas front might suffer such heavy ensualties that the reinforcements for its battalions on the lines of communication were madequite nine of communication were inacequited to reform its ranks while other brigades may have suffered no serious losses and in such cases these battalions obviously had to be reinforced from other regiments. Today the Cardwell principle, here here found the test and regiments. has been found to be too rigid even in time of peace. The foundation of icinforce ment under the Cardwell system was that there was an equal number of battalions at home and abroad but after the Second World War it was clear that fower I battalions would be required owing to the development of airborne and armoured dive, and also because the army in India would be heavily reduced after power was handed over to Indians Possibly the most convenient reorganisation for reinforcement would have been the forma tion of a Corps of I, in which postings could be carried out without regard to regimental ties—But this suggestion was resisted and compromise reached (1940) whereby a system of grouping was effected by the formation of lifteen groups of regi-ments with territorial or traditional connexions Every buttalion in each of the so self contained corp, returns its separate identity. In order to reduce the total number of battalions it was decided to relegate some to temporary 'suspended animation without officers or nien on their strength, but it adv to be recreated in emergency and in any case at the end of a stated period

I actual Organisation and types of men British Infantry—The number of men which can be controlled in battle by one commander is strictly limited. The basis Lactual Organisation and Lquipment of of I organisation is accordingly the sec-tion which is the largest group of men which can be per on ally controlled by its leader throughout the battle Sections are grouped into pix ones, platons into companies companies into battalions, and buttalions into I brigades which are the largest unit which consist solely of I This system known as the chain of command. chaures orderly mand uvres by any number of units in accordance with a single plan, and chables the section commander to assist in giving practical effect to the plane and instructions of the commander in chief An I but alion consists of head quarter company support company, and four 'rifle' (in fact, light machine gun) companies It is commanded by a lieut colonel, with a major as second in command. The headquarters company is com-

The section is the fire unit Companies of each battalion are designated by serial letters or numbers, platoons are numbered serially throughout cach bat tahon

After 1936 all I battalions of the Brit Aimy gradually became either 'machine gun battalions' or 'rife battalions,' so as to provide I brigades consisting of three rifle battalions, and one machine gun battahon each

During the I irst World War open war fare had soon become impossible, and the employment of cavalry was very much cuitailed on the W. I ront and not only was the evalry converted into I, but the proportion of I to other arms greatly in creased. Before the introduction of tanks a battle was usually a contest between opposing I supported by artillery Assautillery could not advance to hold posi

tions offensive action fell entirely to I

The modern Brit I is equipped with The modern Brit 1 is equipped.

rifics bayonets, grenades, Vickers mad inc guns, Bren light machine guns sten sub machine guns, mortars and antitank guns and antitank projectors. Antiplicity of weapons and methods calls for a better type of recruit than formerly if he is to a implate the knowledge for their effi cint application. Consequently educational training now forms an integral part of the Brit soldier's life More attention also given in the modern army to the sold and recreational training so as to the infantary recreations training so as to choure fitness for sorvice under more streamons cond tions. The kit carried by the infantryman has been increased in order to provide him with the means of defence (1) against shrapped by the provision of a steel holmet and (2) against gas by the provision of a gas respirator. These additions hinder mobility to a certain extent and I are now if required to operate it a distance transpirted of her by road or ty are This fact his given use to two specialised types of I buttalion—the m stor battalion which f rms t integral part of aimouned torn it t at the ah borne or parachute latt di l'annaported either by glider or ty i of irrying air coaft. With these two el tions Brit. I lattilions fend to b 3 more uniform type than those of most immessince there s no special estab for lifte (Jaeger, Chasseur or) of inountain (tabiry-jaeger, Chasseur fir in) units

i further characteristic of Brit tactical I organisation is that whereas the regi not of most armise consists of two to four partly 'rifle' but thous together with minuter gun, and the and sometimes cuginar companies which all form an integral part of the regiment, the Brit bright is essentially a team of these lidenical battallons. In action this can for na Brigade Group (U.S. Combat Team) together with a very thought the state of the control of the combat Team). together with artill rv, engineers, anti-tank guns etc allocated from other arms of the div, but in a lation each battalion disposes, in its support company, of its manded by a major or a captain. The platoon is the smallest I unit which can be divided into interdependent bodies each capable of fire and managure. It machine-gun platoons Where machine is thus the unit on which all I tactics are

of 1935 still exist, they are under the command of divisions or of higher formations. Infant Schools. The Swiss reformer-pastor, Jean Fréderic Oberlin (1740–1826), pastor, Jean Fréderic Oberlin (1740-1826), was the founder of I. S. on the Countinent, but Robert Owen (1771-1854), the Eng. social reformer, independently inaugurated the idea in Sectiand by forming a crèche at his father-in-law's cotton-mills at New Lanark on the Clyde. This crèche became the nucleus of a school guided in 1816 by a headmaster, James Buchanan. In 1818 Buchanan was put in charge of an I. S. at Westminster, and on his advice Samuel Wilderspin was given the headship of a school in Sutultibility in on in advice Stating of the Spirit was given the headship of a school in Spiritlields in 1820. When the London Infant School Society was formed in 1821 Wilderspin superintended the opening of numerous schools. David Stow (1793-1864) was instrumental in forming the Glasgow Infant Company of the State of State instrumental in forming the Glasgow Infant School Society in 1826, which performed pioneer work in Scotland. The influence of Friedrich Wilhelm August Friedrich 1832 (gr., the tier, educationist, made itself felt in the middle of the ninetcenth century in England, and the first Kindergarten (q.r.) school was opened in Hampstead in 1553. Physical exercises and games, story-telling, and the use of the Froehel 'Gifts' were now used in the education of children under legal school age. Dr. Montessori's system, signally successful in Italy, was introduced into England early in the twentieth centre. tury, with its revolutionary ideas of childfreedom, and the encouragement of indi-viduality among children. At about the same time Margaret McMillan instituted her Open-Air Nursery School in the shim dist. of Deptford, naming it after her sister Rachel, who had shared her enthusiasm for child welfare, but had died before this scheme could attain reultion. In open-air shelters children are taught the elementary facts of health and cleanliness in addition to their juvenile lessons; they are taught personal service; certain stated are taught personal service; certain stated times are given to rest; and good food is provided for them. See D. Salmon and W. Hindshaw, Infant Schools, Their History and Theory, 1904; P. B. Bullard, Practical Infant Teacher, 1929; J. W. Adamson, English Edwardin, 1769–1902, 1930; Margaret McMillan, The Nursery School, 1930; Margaret Lowenfeld, Play in Childhood, 1935; Maria Montessori, The Serret of Childhood, 1936; P. E. Cusden, The English Nursery School, 1942. Infant Welfare, see Marenviry and Infant Welfare, INFANT WELFARE. Welfare, see MATERNITY AND

Infection, distinguished from contagion (2.v.) by reason of the fact that it signifies the transmission of a disease without direct contact. Thus infectious diseases without direct contact. Thus infectious diseases without direct contact. Thus infectious diseases are usually contracted by breathing. In malarial disease, e.g. ague, the disease characteristic on the courts of the univs. of the courts of the univs. of the courts of the univs. of the courts of the univ. contagious. I. depends upon the presence of a germ (q.r.), and prevention is best effected by isolation. See articles on the diseases mentioned, and BACTERIA, CON-PAGION, DISLYREMANNS, and HYGENE. Infettment, or Sasine, in Scots law means

both the act or symbolical ceremony of giving to another the possession of heritable land and the writ or instrument of sasine in which such act or ceremony is expressed. I. being a feudal act, and the crown being the lord paramount of all Scottish feus or fiers, an I. can only be under a grant from the Crown. This is interpreted in prac-tice to mean, that to constitute a valid I. the transferee must show a fendal chain of title going back ultimately to the crown. But there may be real rights without I. These exceptions include leases, servitudes (analogous to rights of way or other rights over the land of another), udal lands situate in the Orkneys and Shetlands, crown lands, and churches and glebe of the Church of Scotland. The chief methods of I. now in vogue are: (a) By direct registration. (b) By transmitted warrants, i.e. by a transferor who is not hunself infeft and can only transmit through another. By notarial instrument, used where the disponce does not wish to record the whole of the conveyance. (d) By warrant of registration under the Land Registers Act, 1863, and the Consolidation Act of 1868.
(c) According to the clause of direction in a deed to record the deed in the Register of Sasines. It has long been settled that a purchaser, or a londer on heritable se-curity, is entitled to rely on the registerof sasmes, and is not affected by any conveyance or encumbrance which is not recorded on the register.

Inferior Courts comprise in England all those that are below the dignity of the High Court of Justice, and whose decisions are subject to review by the High Court. The prin. I. C. exercising civil juri-diction are the co. courts, from the decisions in which an appeal lies to the High Court where the amount involved exceeds 220. Where the plaintiff in the High Court has no visible means of paving the defendant's costs, the defendant may, on swearing an affidivit to that effect, get an order re-mitting the case for trial in the co. court. There are also certain local courts exercising a considerable civil jurisdiction, the most important being the Chancery Court of the County Palatine of Lancaster, the powers of which, within its local limits, are similar to those of the Chancery Div. of the High Court, the Mayor's Court of London, the Court of Passage of Liverpool, and the Salford Hundred Court, all exercising within their local Huntra a full common law jurisdiction. The courts of the univs. of Oxford and Cambridge have by anet. charters a junsdiction in actions to which any member or servant of the univ. is a party, at least where the cause of action arose within the liberties of the univ. Other I.C., called the Eccles. Courts (q.v.)

(1) The general co inferior degree are sessions or quarter sessions (see COUNTY Sessions), which is a court of first instance and of appeal against summary convic tions by petty sessional magistrates. An indictment (q, r) may be removed to the King's Bench Div from quarter sessions by writ of certiorari (q v) in certain cases such as where an impartial trial cannot be had in the I C, or some more than ordin arily difficult point of faw is involved (2) bor quarter sessions, with judicial functions dentical with those of the co-quarter sessions, and presided over by a recorder who becomes a bor magnetrate session. writtle ffice (1) petry sessional courts consisting of it least two instices or a police or stipending magnitude or the lord mayor of an alderman in the city of London These courts have a limited jurisdiction to try indictable offences under the Summery Jurisdiction Acts The King's Bench Div can grant a cotherer to transfer tease to the High Court where the magistrates exceed their juris diction or there is some meanifest informal ity, and on a special case stated by the jus-tices can decide any point of law submitted for the decisio High Court Again the High Court may Issue a writ of pre hibition to top proceedings wher the magistrates have no jurisdiction and generally so iking my I C which at tempts to exceed the limits of its an di tion may l' prevented by such a writ and conversely a writ of mandamus may be issued to compiling I do exercise its fort diction at all events in easies where i lief is son lit in respect of the intringe

l mammation, term used to denote cer nti su chin, whi h tre accompanied on and he at sentitions of reduces, swelling, an and he at sentitions I is primarily a precisive process by which the body tempts to get rid from a fritating or in the most exercise disease and injury. Modern in street a factor of all most exercise disease and injury. th mes tend to attribute the symptoms known as 1 to reat one between microbes and the white corp wells. Where the tis sue are injered at i no germs are present to argue that space is us 'measurable 'a' the process of each rock now the surface of an imbounded sphere is body, or the necessarity unbounded circumference of a vast circle, and, again, be cause geometry can conceive of an immeasurable and unbounded straight line of an excess of blood. The blood stream is retarded in the region of irritation; this gives the red appearance and also accounts for the sensation of heat. The blood vessels become dilated and there is considerable effusion of white corpuscles through the walls of the vessels. The continuance of the irritating stimuli part with still great effusion of lymph and white corpuscies, so that the part swells, the feeling of heat becomes more intense. and the pain takes on a throbbing character owing to the communication of the motion of the heart to the dilated arteries. The white orpuscles are busy destroying germs, dead tissue is being detached, and new tissue built up; the products of I. are carried away in the blood, or discharged from abscusses, etc. The treatment of I. involves antiseptic dressings in case of skin I., lotions and gargles in the case of I. of the nose and mouth, while if the I. is situated in any portion of the alimentary canal, the natural processes by which waste and injurious products are got rid of may be helped by suitable drugs. To lessen the discharges and subdue the inflammatory process astringents are employed.

Inflammation of the Eye, see Intils.
Inflation and Deflation. Where a rise
or fall in the general price level is due to an increase or decrease, actual or prespec-tive, in the supply of money we have in-flation or deflation. Commonly, I. and D. connotes abnormal expansions or contractions of money associated with marked effects on the price level. Slight inflation tends to stimulate trade, since if people expect prices to rise tomorrow they hasten to buy today. Deflation works the other to buy today. Deflation works the other way, since it lower prices are expected buyers will wait. A fall of particular prices does not mean deflation: it may be due to increased efficiency.

Inflation, or rather the policy that makes it inevitable, has great attractions for the statesman. It is a thankless task to refuse claims, eminently reasonable in themselves, for more wages, more salary, more compensation, etc., and a great temptation to follow, in greater or lesser degree, the line of least resistance. But if the money is not there concessions mean its undue creation, and the dilppery dope of inflation. While slight inflation may be innocuous if not advantageous, high inflation means total loss of faith in the currency, ruin to those dependent on savings, and general dislocation of business with wages and priors chasing one another in a vicious spiral.

The terms I, and D, came into use in

the letter half of the infection into use in the latter half of the infection into general use during the First World War. The paper 'greenbacks' of the Amer. Civil War represented a con-siderable inflation but the First World War and its aftermath produced inflations of quite a different order. Russia, Austria, and Germany all experienced high inflation. In Germany in 1923 a new mark, the Rentenmark, was introduced, ex-changing for one billion old marks. In

their way by taxation and savings and, to fill the gap, resort to borrowing from the banks (so causing the creation of banks money) as well as to printing bank-notes. Even so Germany emerged from the First World War with relatively moderate in-flation: it was in the special circumstances of the post-war years that the mark be-came practically worthless.

The following figures of percentage increases in wholesale prices give an indica-tion, by no means precise, of the inflation which occurred in certain countries over a ten-year period (1937 47) covering the Second World War:—

Beside paper inflations on the Ger, or even the Chinese model, metal inflations seem of small account. Nevertheless the seem of small account. Nevertheless the Sp. conquest of America brought large quantities of the precious metals to Europe and red the inflation that funned trade in Shake-peare's day, besides helping to diminish the value of royal revenues and send the Eng. monarchy to Parliament for more and more money. Again, the discoveries of gold in California and Australia in the middle of the last century inflated the money-basis of the gold standard countries. Later, improvement in mining technique had a similar effect. On the other hand the demand for monetary gold may itself cause a gold dellation, as oc-curred notably in the latter part of the nineteenth century and again between the wars. Superimposed on such basic move-ments the 'Trade Cyclo' brought its own alteration of I. and D., boom and slump. While the inflations of the Trade Cycle were in no way comparable to the extreme inflations of modern times the loss, unemployment and distress caused by the deflationary phase induced a search for less drastic ways of adjustment. Present hopes are centred in the International Monetary Fund. (See Briefron Woods AGREMLYS, ECONOMICS, and MONEY, Drastick to the table of the Control of the Co One point emerges; just as the stability of the paper C depends on Parliament so, in the last resort, does the continuing decision to remain on a gold standard. A Parliament that in due time takes the necessary steps for remaining on gold should not, alternatively, fall to take the necessary steps to prevent an undue depreciation of the paper &. But Parliament is not uninfluenced by public opinion: under the gold standard deflationary measures were perhaps made more palatable to the wage-earner by judicious reference to the necessities of 'economic law 'although this did not prevent stronuous opposition to the wage adjustments that were a part of the gold standard mechanism. If real income has to be cut there is no doubt that inflation will do it modern war nations find it increasingly there is no doubt that inflation will do it difficult, not to say impossible, to pay less painfully than the gold standard; but inflation is the 'slippery slope,' and that umbellate fashion, each branch producing remains the dilemma.

inflation is the 'slippery slope,' and that remains the dilemma.

BANKING, CURRENCY; and PAPER MONEY.
Inflection, or Inflexion (from Lat. inflectere, to bend), in grammar, the variations, changes, or modifications of form which words undergo to express various relations with other words of a sentence or clause. It forms an important div. of philology, and is subdivided into conjuga-tion (verbs) and declension (nouns, pronouns, adjectives). Gender, number, and voice, as well as case, tense, mood, and person may be expressed by 1,, and some grammarian, include comparison of adverbs and adjectives also under this head. I. is roughly speaking, a mark of Indo-Germanic and Semitic languages as opposed to agglutinative or analytic. It may be internal, initial, or final in Semitic, but is usually final in Indo-Germanic words. except in cases of re ' rication. Modern Eng. has comparatively few Is. left. See also GRAMMAR, PHILOLOGY. See O Jesperson, Progress in Language with special

reference to English, 1894.
Inflorescence, in plants is the floral region, the mass of flowers, the botanical term to indicate the manner in which the thowers of a plant are grouped. The sim-plest form of all is a solitary terminal flower, e.g. daffodil, but more often there is a more or less complex system of branching (q.r.) in which the branches do not develop into foliage-shoots but bear flowers. The stalk upon which the flowers are borne is known as the peduncle or rachis; if the flowers spring directly from the peduncle they are said to be sessile, but if they depend from a secondary stalk they are said to possess pedicels. An I. found at the apex of a shoot is terminal, if found in the axils of leaves it is axillary. There are two distinct types of I.; in-definite or racemose, when the flowers at the base open first; and definite or cymose when the flowers at the apex first become mature. One of the commonest forms of the indefinite I. is the raceme, m which the flowers are connected to the peducele by pedicels, e.g. lily-of-the-valley and birdcherry. The corymb resombles the produced at different levels, are all of different lengths and the flowers are hrought to the same lovel, e.g. candythat Pyrus sortus. The spike is an indefinite I. Pyrus sortus. The spike is an indefinite I. with sessile flowers, r.g. plantain and gladiolus, while the catkin is a long, deciduous crowded spike bearing unisexual decidence crowded these bearing unleaving theorem, e.g. hazel and birch. In the panicle the axis of the I. branches, and each branch forms a raceme, e.g. cats and traveller's joy; in the simple unbel all the pedicels are given off at one level owing to the abbreviation of the mother-axis,

umbellate fashlon, each branch producing a simple umbel, e.g. hemicek and carrot. The type common to flowers of the family Composites is the capitulum or head, in which the flowers are sessile and are borne on a shortened mother axis, e.g. Olearia and dalay. The curious I. known as a thyrsus is mixed, being a raceme itself composed of short cymes, and is found in the like and horse chestnut. A dichasium such as is seen in Euonyasus is a biparous cyme in which each axis produces two daughter axes and onds in a flower. The I. of the fig is a peculiar, hollow, pearshaped capitulum, and the flowers are produced internally; this is called a hypanthodium. The verticillaster, common to the dead-nottle and Jerusalem sage, consists of what appear to be whorks of flowers, but these in reality stand ene above the other and are borne in the axils of leaves on opposite sides of the stem. Finally, a glome fulle consists of a number of cymes united to form a head, e.g. box and nettle.

glominale consists of a number of cymes united to form a head, e.g. box and nettle. (See illustration, p. 504.)
Influenza scens to have been spread through Europe during the Crusades. Supposed to be an infliction of heaven, I. was named the influentia cali. From this was derived the It. name influenza, first used in Eng. by Huxham in 1767. I. is popularly confused with a severe cold in the head, but although it has many resomblances to catarrh yet there are points of difference. Thus I, brings with it an imdifference. include depression of spirits, and sudden debility. The sense of taste and appetite debility. The sense of taste and appetite are lost, the tongue may become white and ereamy; while sneezing and running of the eves are frequent accompaniments. Shivering fits commence the course of the disease, accompanied by a rise in temp., headache, pains and soreness all over the body, while the pulse becomes weak, and the skin, at first hot and dry, becomes most. In ordinary cases the scute symptoms of the skin and the skin at first hot and dry, becomes most. toms pass away after three days or more, when with care convalencence begins. There are always dangers of relapse, and premature exertion may easily bring on heart disease or even wreck the nervous system. I. is an epidemic (often a pan-demic) disease, and spreads very rapidly. The atmospheric condition with which it is connected is not known. It may occur in all kinds of weather. It is known, however, to travel generally westwards or from S.E. to N.W. Thus the great epidemic of 1559-90 started in the Far East and spread rapidly over all Europe, and became the worst epidemic experienced for forty years in Britain. Since then it has appeared epidenneally annually in some part of the Brit. Isles.

Pyrus sortus. The spike is an indefinite I. with sessile flowers, e.g. plantain and gladiolus, while the catkin is a long deciduous crowded spike bearing unisoxual flowers, e.g. hazel and birch. In the patient the axis of the I. branches, and each branch forms a raceme, e.g. oats and traveller's joy; in the simple umbel all the pedicels are given off at one level owing to the abbreviation of the mother-axis, and e.g. dwarf-cherry and cowslip; in the compound umbel the axis branches in an of the attack, and in cases where cardiao

irregularity occurs, heart tonics are administered. Then in the convalescent stuge, rest and the moderate use of stimulants, together with nerve tonicy like pre-parations of iron, quinine, and strychnine. or hypophosphates, etc., are the best means of overcoming the resultant debility. A see voyage or a few weeks at a watering-

place is, however, the best cure.

During recent years, efforts have been

made to collect accurate statistics relating to L and to trace its cause. Recent pandemics have been preceded by scattered cases, and evidence shows that the first great wave of the disease is characterised by symptoms of severe and acute fever, with little affection of the upper respiratory tracts. These are much more definitely affected during the second wave, following about two months later, in which bronchitis and pneumonia are common secondary developments. Later may fol-low a third wave, usually less severe, and characterised by tendencies to catarrh and pulmonary trouble. In some pandenics there have been waves of gastro-intestinal and of nervous type. In epidemics of L the predominant batterio found in indi-Viduals Suffering a months disease are Bacillus influenca, discovered in 1892 by Pleiffer, various streptococci, and Bueillus procumes and some of these seems to be invariably present. Fulk and his col-leagues, working on the L epidemic in Chicago (1928-29) identified a streptochedge (1928 29) identified a steepho-coccus which they believed to be the prim-ary infective agent. It is known now, however, that the cause of L is a filterpassing virus originally discovered by Dr. C. F. Andreweg. The viruses of influenza C. F. Androwes. are minute creatures, a traction of the size of germs such as those that cause boils. and they pass easily through the porce of such fine filters as earthenware rods which can hold up the larger bacteria. munisation, such as is practised for diphtheria, smallpox, and other illnesses, can thera, simulpox, and other timeses, can be provided for 1, but there are greater practical difficulties in making anti-L vaccines. For the viruses have to be grown on hens' eggs and the supply of sufficient of these to produce sufficient vaccine for

search on this subject. Diagnosis of the di-case, though com-paratively easy during epidemics, is still unreliable in isolated cases because the symptoms of the various forms of I, are so diverse. The view that these diverse forms are manifestations of the same disease, varying in character and intensity, is an outcome of the work mainly of Brit. , epidemiologists. See BACTERIA and EPI-

a whole pop, poses practical problems. The immunity again t I, can, as yet, be made to last only a few months and would times a year. The I. Unit of the World Health Organisation is engaged in re-

DEMIOLOGY.

In Forma Pauperis (' in the character of a poor man'). Any person may sue or defend an action as a pauper on proof that he is not worth £25, his wearing apparel and the subject matter of the cause only must lay a case before counsel for his opinion as to whether or not he has reasonable grounds for suing as a pauper: and no person may sue as a pauper unless the statement of the case laid before counsel for his opinion, together with the counsel's opinion and an affidavit by himself or his solutor that the statement of the case sets out fully and truly all the material facts to the best of his knowledge and beliel, are produced to the court or judge to whom the application to sue in forma pauperes is made. No court fee is paypauperes is linde. No court tee is pay-able by a person admitted to sue or defend in forma pauperis. Where a person is admitted to sue or defend in forma pauperes, the court may, if necessary, assign him counsel or solicitor, or both, to assist him, and these latter may not refuse assistance, except for good reason shown. Int person who agrees or endeavours to take or obtain any fee or reward from a person admitted to sue or defend in forma purpers for the conduct of the business as to which he has been so admitted is guilty of contempt of court (q.r.); and if the pumper hiszant agrees to give any fee, he will be at once disentitled to sue or defend in the same case as a purper. It is the duty of the solicitor assigned to a pauper litizant to take care that no notice is served, or summons issued, or petition presented without good cause. See also Poon Prisoners' Defence.

Information: (1) Mode of proceeding against persons accused of crimes other than felonies. It is a speedy process, which brings an affender to trial without a previous finding by a grand jury. Such criminal Is, are of two kinds: (a) Is, ex othern, and (b) Is, by the Master of the Crown Office. The former may be used in certain cases of misdemeanour, such as seditions libels, or riots, oppression, and bribery by imagistrates or other others, or other unsdemeanours tending to the dis-turbance or danger of the gov., where the circumstances are such that the codinary delay- meidental to legal process must be avoided. In form an ea officio I, is a tornal written charge of an offence filed by the attorney-general in the King's Bench the attorney-general in the king's Bench Dry. A Crown Office I, is yiled in the King's Bench Div, by the Master of the Crown Office on the application of a private individual. Leave of court must first be obtained, such Is, are only granted in the case or suggestions of the commission of infederations of the commission of infederations of a gross and notorious kind, i.e. agravated libel, bribery at elections. In practice 1s, for fidel are only granted where the person libelled occupies a public office or position. After a criminal 1, of whatever kind has been that the most better the contract of the co been filed, the accuse his tried in the usual may by a petty jury. (2) A charge made to a justice of the peace or stipendiary or other magistrate of some offence punishable on summary conviction. A justice cannot issue warrant for arrest in the first instance, except upon an I. or complaint m writing made on the oath of the in-formant or other person on his behalf. Where a summons only is issued in the excepted. Before being allowed to appear that unstance the L need not be on oath or in formu pauperis as a plaintiff a person in writing. See Archbold's Criminal

Infusion, processole virucing the active principles of vegetable substances without boling. The product of the process is also turned an I. The general method is to digest the parts containing the substance to be extracted in water. If the substance is polatile and is soluble in cold water, it is better to digest the material in by Is., where a statute expressly allows cold water, as it can then be extracted them to do so, and in any case must be without admixture of other substances, brought within a year of the alleged long active principle, are, however, more offence. In another sense, the term I, is readily soluble in hot water, and the temp, used to denote an accomplice in crume who should be regulated according to the degree of volatility of the substance. When it is necessary to boil the mixture the process is known as decoction; this is often ac-companied by chemical changes in some

of the substances concerned.

Infusoria, term applied to numerous classes of active protozon appearing in stagnant infusions of animal or vegetable matter. The majority of them occur in great numbers, and are provided with vibratile locomotor processes of their living matter, which are practically permanent, and express the predominantly active constitution of these cells. When dirty water is held in a glass vessel between the eye and the light I. are generally quite visible, though most of them are micro-scopic. They occur both in fresh and salt water.

Ingatestone, small tn. of Essex, 6 m. S.W. of Chelmsford. It has an interesting Norman church with a lifteenth-century tower, and Rom. bricks have been set in the walls by the builders. An Eliza-bethan manor-house was a refuge for Rom. Catholic priests during the Reforma-

tion. Pop. 2300.

inge, Very Rev. William Ralph, Eng. divine, b. 1860 at Crayke, Yorks.; eldest son of Rev. Win. Inge. D.D., provost of Worcester College, Oxford. Educated at Eton and King's College, Cambridge where his career was brilliant. He was where his career was brilliant. He was assistant master at Eton 1881-98; fellow and tutor of Hertford College, Oxford, 1889-1904; Lady Margaret prof. of divinity Cambridge, 1907-11; dean of St. Paul's Cathedral, 1911-34. In theology, I. is an extremely liberal Protestant - holding miracles and all such materialistic adjuncts of religion very cheap. But what makes him one of the most prominent clerics in England is his insistence, in learned books and popular journalism, on Platonic principles as guides to Christian practice. parent opposition to democracy, combined parent opposition to democracy, combined with his dry and austere manner in the pulpit, earned him at one time the sobriquet of the 'Gloomy Dean.' His writings include: Society in Rome under the Casars (1886), Elon Latin Grammar (with Rawlins, 1889), Christian Upsticism (1899) Faith and Knowledge (1904), Studies of English Mystics (1906), Truth and Falsehood in Religion (1906), Faith (1909), Speculum Anima (1911) Types of Chris-Speculum Anima (1911) Types of Christon Santliness (1915). The Philosophy of Plotinus (1918). Outspoken Essays—(first series, 1919), (second series, 1922), The Victorian Age (1922), Personal Religion and the Life of Decolion (1921), The Platone Tradition (1926), Lay Thoughts of a Decoline (1926). The Chieffen De World Platone Tradition (1926), Lay Thoughts of a Dean (1926), The Church in the World (1927), Christian Ethics and Modern Prob-lems (1930), God and the Astronomers (1933), A Rustic Moralist (1937), A Pacifist in Triuble (1939), The Fall of the Idols (1940), Mysticism in Religion (1947), The End of an Age and other Essays (1918). An excellent selection from his works is Wil and Wisdom of Dean force by the Iones Marchant (1937). Inge, by Sir James Marchant, 1927.

Ingelheim, two small mrkt. tns. of Germany adjoining each other in the Rhineland-Palatinate, formerly republic of Hesse-Darmstadt, about 8 m. W. of Mainz. At

one time they were celebrated for the palace of Charles the Great. Pops. 5100 and 1100.

and salt. Pop. 9000.

Ingelow, Jean (1820-97), Eng. novelist and poetess, b. in Boston, Lincolnshire, She pub. her first poems, A Rhyming Chronicle of Incidents and Feelings (1850), anonymously. Her poems are characterised by their novelty and churm, and her novels also are worthy of attention. Among her works are Poems (1863), which contained 'The High Tide on the Coast of Lincolnshire, 1571,' one of her best; 'A Story of Doom' (1867), 'Deborah's Book and the Lonely Rock' (1867), 'The Grandmother's Shoe' (1867). Among her words are: Moosa the Fairy (1869), anonymously. Her poems are character-Grandmother's Shoe' (1867). Among her novels are: Mopsa the Farry (1869), Off the Skillus (1872). Faled to be Free (1875), Don John (1876). See Some Recoltections of Jean Ingelow and her Early Friends (London), 1901.

Ingenohl, Friedrich von (1857-1933), Ger. admiral, a great favourite of the Kaiser Wilhelm II., whose yacht he once commanded. He was commander-in-chief of the China station previous to his appointment to the Supreme Command of the Ger. High Sea fleet in 1913. He was still in com-mand on the outbreak of the First World War. His policy of raiding with cruisers such as at the Dogger Bank (q.v.) was not approved owing to its costliness, and in consequence he was placed on the retired list, being succeeded by Adm. von Scheer, Ingersoll, Robert Green (1833-99), Amer.

lecturer and lawyer, b. at Dresden, New York, the son of a Congregational minister. He practised law in Illinois, and in 1857 went to Peoria. In 1862 he became a colonel in a cavalry regiment, and not long after was made attorney-general of Illmos. He became known by reason of Himos. He became known by reason of his lectures directed principally against Christianity. Among his writings are: The Gods and other Lectures (1876), Some Mislakes of Worses (1879), Great Spicches (1887). See E. G. Smith, The Life and Tomorseeness of Robert G. Ingersoll, 1904. Ingersoll, in of Oxford co., Ontario, Canada, It stands on the Canadam Network and Canadam Death.

National and Canadian Pacific Railways, and on the Thames R. It manufs, agric, implements and furniture. Cheese, but-ter, and grain are produced in the dist., and there are flour and planing mills. Pop. 5900.

Inghirami, Tommaso (surnamed Fedra from his success as Phadra in Seneca's Hypolytus) (1470-1516), poet, crator, and humanist of an it, noble family. Seven of his Lat, crations were pub, at Rome in 1777, and Erismus says he was called the Cicero of his age.' Julius II. made him keeper of the Vatigan library. He left Mss. of a Commentary on Horace's 'Ars Poelica,' and Abstract of Roman History

Piny In 1806 he proceeded to Rome to redestate and any title or dignity and mined exclusively to the person who prior to 1925, it is entitled on an intesticy to redestate and any title or dignity and herdcoms passing will the estate, (2) the maxim Nemo est here extentis (no one is

property until the death of the ancestor. As a corollary of (1), it is to be observed that a person named in a will of realty is by Eng. law a derisee and not an heir; in Rom. law the term 'heir' applied indis-eriminately to all who, being in the power criminately to all who, being in the power of the head of the family, had a natural claim on his property, irrespective of whether they took under a testament or on intestacy. To exclude effectually his own heirs, the testator had to do so by name in the will. But it was essential to institute an heir of some kind, for a Rom. testament was of no effect unless there was such a person to succeed to the persona of the testator, i.e. to continue his legal existence after death. Later, excluded children were given the right to impugn the will if omitted in it, and recover a certain share of the property. Eng. law the fundamental difference in the canons of descent to real property from the Rom, and systems founded on the civil law is that the rule of primogeniture has prevailed from remote feudal times until the Administration of Estates Act, 1925. The old rules of descent to free-holds of I. were these: (1) Descent is trued from the last 'purchaser' (a technical term meaning the person who last took in any other way than by descent); (2) descent is to the lineal issue in infinitum; (3) males are preferred females : primogeniture determines the male entitled, but females succeed equally as co-parceners (q.r.). (1) Remoter lineal issue 'representing' their own parents (who would if not deceased have suc-(eeded to the property) take per stirpes, i.e. as opposed to taking per capita or in their own right. (a) the nearest ancestor takes on failure of lineal issue. The rules of intestate succession are now uniform for both real and personal property, SUCCESSION, INTESTALL See also GAVEL-KIND, BOROUGH-ENGLISH.

Inhibition, used in a technical sense of

the sentence passed upon a clergyman, by which he is prevented from the exercise of his eccles, functions. It can therefore he used as a weapon for enforcing the laws of the church, also a will to prevent a judge from proceeding further in a case.

in psychology, the word used for a subconscious urge to express the personality in some way which the conscious mind

Inia (Inia geoffrensis), toothed fresh-water dolphin, found in the lakes near the Cordilleras and in some of the upper tribs. of the Amazon, where it is regarded with superstition by the Indians. It is about 8 ft. in length, has a long cylindrical snout with stiff hairs, and only the merest rudi-ment of a dorsal fin. It is generally found in troops of three or four and is hunted on account of the oil it yields. It feeds chiefly on fish.

inisfail, see [NYISFAIL.

Inishkeel, is, of freland, belonging to co. Donegal, and situated in Gwecharra Bay,

with a capacious harbour.

Inishmacsaint, par. of Ircland on the
Erne, parily in co. Donegal and partly in
Fermanagh. It is named from an abbey Fermanach. It is named from an abbey in the times of auct. Rome in the question founded by St. Nenn in the sixth century. literally asked of the people, 'Jubetiane?'

Inishmore, is. of Iroland, situated at the mouth of Galway Bay. It is 9 m. in longth and 21 m. in broadth, possessing two natural harbours on the N. coast.

Initial, first letter of a word, especially of a name. Ornamentally arranged, they are a feature of Irish (see KELLS, BOOK OF), and Carolingian book decoration, often of full page size and rich in colour. In the text of the Incunabula (q.o.) they were usually inserted by hand, later with woodcuts (e.g. Holbein's Danre of Death) or copper engraving, fitted to the typographic style. See also ('APITAL: ADBRIVATIONS.

Initials. In some cases signature by 1. constitutes a good signature in law. Section 12 of the Civil Procedure Act, 1883. provided that in all actions upon written instruments it should be sufficient to designate any of the parties by their initials, but the section is now obsolete. There are decisions to the effect that sig-nature by I. is allowable in the case of memoranda and agreements comprised under the Statute of Frauds (see Fravos, Staturn or). By the Wills Act, 1837, a will or codicil may be validly signed by I. only. Probably there are no documents which in the eye of the law must be signed in full, although it is clearly unwise from the point of view of identification not to do so. A deed certainly requires no signature, the traditional essentials of every deed being no more than scaling and delivery. In Scots law Lalso constitute a good signature of a deed, but the genuineness of the l. must be proved.

Initiative, in legislation it is a common-

place of political science that very few constitutions are really so framed as to ensure the representation of the views of the unjority of the electorate upon any one particular issue. Some deny that a representative chamber like the Eng. House of Commons is returned for the purpose of effect unting the will of the majority upon every single issue, on the ground that legislative authority and ounipotence rest with Parliament and not with the electorate, and it is further asserted that any relation of agency as may subsist between the electorate and its repre-sentatives subsists only so for as the latter can be said to be entrusted with a mandate for carrying out a general party policy. Sir A. Dicey points out that it is inconsistent with the legal notion of Eng. parl, sovereignty to suppose that parl, electors have any legal means of initiating, sanctioning, or repealing the legislation of Parliament, because the opinion of the electorate can only be expressed through Parliament. Not that this view of the functions of the electorate is by any means essential to a representative polity, for in Switzerland all parl, deliberation is regarded as purely preliminary, and by the process of the Obligatory Referendum of legislative proposals, a legislative necessary over after being passed by the Federal Assembly, must on the demand of a certain number of citizens be submitted to the electors for formal approval before it can become law. This, indeed, was done

Some of the Swiss cantonal constitutions go even further than this by the device of the right of I This right makes it incumbent on the legislature to pub proposals advocated by a cert un proportion of the electorate, and cause them to be voted on at the local polling stations. It must be conceded that the I ensures the literal observance of the will of the majority but it is questionable whether it is a sound at luge the actual business of live making political expedient to cost on the people Practised politicisms unist almost of necessity be better able to formulate the general aims of the majority in detailed proposals than the people themselves Moreover, the people he soft to be so blinded by prejudice of a fit passion as to be meapable of weighing up all find can be said for and against a proposed law and ecitually it must hanger indefinitely the work of legislation in every important amendment suggested at investig of a Bill has to be referred to the elector de for approval Sidgwick inspired by Ben tham advances the macrious solution of making a member selection unrully to new thic with a view to deferring the final ratification of the legislative measures of the vert until the election so that in l the intermethe people ay haye an op portunity for cancelling any unpopular legal taxe innoverent lor real dr. r sion of the question of the control of the people over gov see H. Silkwick. He ments of Politics 1891, ch. xxvii.

Injection, act of infreducing visibs a common one of other eff the crivities of the body of the substance is generally comploved as in agneous solution on the reactive effect by due the fection on the reactive fection on the substance of the substance onto the substance onto the substance on the substance on the substance on the substance of the substance

Injector, apparitus for foreme water into a boild urinst the pressure of the steam. M. Henri toffaid invented an I. in 1538 which is now in sen ratuse ste un from the boiler passes into a come il pipe the size of the opening of which can be regulated by an adjutable conc. As the steam rushes out of this it meets the feed water, and is condensed, so are it my a par tial vacuum, which causes the water to rush in with a very great velocity and to pass down mother conical pipe. The corping steam behind helps to drive it As it emerges from the down this pipe narrow end of this comeal pipe it passes into the narrow and of another one as it passes on down this expanding cone, its velocity slackens and the pressure in creases so the water is forced into the boiler through a non return valve. This I. may be worked either by exhaust steam

Injunction, in Eng. law, a remedy given as a rule by a court of equity (qv) to restrain one or more of the parties in an action from doing or allowing their agents or servants to do an act which the court holds to be inequitable in regard to the rights of the other party. The I was one of the modes by which the chanc llor built up his whole quity juri diction (see CHAN CHIOR CHANCIPE, IQUITY). By the By this we you the equity courts could overide the common law whenever the latter was m conflict with the dictates of good con in the form of a prohibition command me the Huntin not to go on with his action it come near on pain of nuprisonment for contempt of court if he disobeved (t) 1 (1) into locators or preliminary, or (b final or perpetual. An interlocators 1. Ink, instern a used for producing records of a creation and similar substances. Tho carb streaments appear to have been prepared by suspending some carb account to the such as social at the secretion of the cuttle fish or spir was used. In the diddle Ages there has to me more use in a composed of a decretion of gall must or their tonian wilding substance, maked will in non-salt. The account of these depended upon the form atom of a blinshous time which on extintion (that is, explained with a consistence of the analymic converted into a ble k substance. The modern is bine ble kink' consists a nitially of the same in the intervals. But a ferrous salt is used, and the development of the black colour only takes place after a horter or longer exposure to the air. In old, it that the writting may be visible before oxidation a lourn matter (at ally some indiged derivitive) is added. This causes the blue

nation and of this coment pipe it passes derivitive) is added. This causes the film into the narrow and of another one so, as it passes on down this expanding cone, its velocity stacking and the pressure in the preparation of smalls, either China or crosses. So the water is forced into the boiler through a non-return valve. This Limay is worked either by exhaust stem advents extract a solution of ferrous sulform the engineer by steam from the boiler.

At first a clear solution of a dark blue tion of an Iron salt becomes dark colour is obtained, but from this there solution of a cobalt silt be used for y gradually separates a black insoluble procipitate. In order to keep this in suspen on which the writing has been in sion gum arabic or some other vicid material is added. The I sooks into the paper and is there oxidised, but the prosence of the gum gives to the writing a shiny appearance. In order to avoid suppone and present the corder to what this certain Is at made by issing index suppone and (prepared by dissolving induso in strong sulphum and) to which is added metally non I crious sulphite is thus formed and when the excess of acid is no tradised by me ins of chall, the clear supernatint liquid obtained on allowing the mixture to stand, yields on mixing with a timin solution a cleu fielly flowing 1. Certual conditions require to be fulfilled before an 1 cm be described is satisfactory. It should be non corrosive, non pot-onous, permanent, not easily crised and non-termentable The last requirement is usually fulfilled by the addition of some antiscritic such as phenol or thymol

Int - These Col nired aqueous solutions of the soluble coul tar Thus solutions of the cosms and colouis. thodan mes give ted is brilliant green ind indigo preparations etc. he used for the maint of rece at 1 blue Is are used respectively butther the firs made from Prussian blu li lved in oxide acid so cilled sold ind silver is the obtained by mixing the finely divided met ds or their substitutes with runt and a solution of a soluble silicite. The initial colons of the ink is usually strengthened by the addition of blic infine dyes but these have not the permanence of the iron compounds But mis for temporary pur poses can be made by simply dissolving

such dves in water

Copying Ints are noted by the addition of electric, gum of dixtrictory concentrated soluble tyning I Addition of the c materials greatly act it is the oxidation of the tannate of non-by-tuning a film over the surface of the writing. This dissolves

when the damp tissue, per is applied and an impression is threely obtained Printer's Ink. usually consists of a variash like material made from resur, soop, and a drying oil in which is suspended a olouring matter. For black a mixture of lamp-black and in ligo (the latter in small amount) 1 used. Reds, latter in small amount) i used. Reds, blues and yellows are obtained by me inof eumine, Prusslan blue, and lead chromate, respectively Other colours may be prepared by suitable mixtures of

Marking Inks nearly always contain some silver salt as a basis. A solution of the salt mixed with gum give in contact with organic matter, such as cotton or linen, a tim which on exposure to light or heat or both gradually become black. The stain is indelible, but in come of time fades to a brownish colour.

Sympathetic Inks are those which be come visible only after suitable treatment. Thus a solution of gails may be used for writing. Thereby is produced a writing which on washing over with a weak solu

solution of a cobalt salt be used for writing no characters are visible until the paper on which the writing has been made is warmed. The chaineters then appear blue, such inks are of no practical use, but figure as of import inco in fiction.

Inlaying, method of ornuncating that surf is by the inserting in one material a substance differing therefrom in coloni or nature. Thus the basis may be of w. In tal or stone and inland or en-crust I material of different wood or of muble tottorseshell precions etc. The art of I is practised in metal etc the ribinestion of furniture and artisfic objects of various kinds. I in wood is sent ally known as managerity (g), in metals it is termed dimiscening (q t) and in murble and precious stones it forms a vinety of 'mosaic' (q t) work The word I is, however generally under stood to be limited to the first of those three. It consists in the fitting together, to form patterns, of differently coloured pieces of wood. In the Stuart period a good deal of I was executed in England upon cabinet, the ts of drawers, etc. In It dy the most beautiful examples of the art are on) incls or chon stalls, and in Germany, musical instruments, chand cabinets are often lavishly inlaid

Inman, Henry (1801-16), Amer attist, at I tica, New York, studied under Jarvis Distinguished principally for his portraits of Amer. and Eng. statesmen and | men of letters.

Inn, riv. in Austria, one of the chief affluents of the Danube. It rises in the Engadine, Switzerland, and flows through the Tyrol and Bavaria, its total course being estimated at about 310 m. In-sbruck is on its banks.

Innate Ideas in the philosophy of Descurtes are the clear axiomatic principles whose certainty cannot be doubted. They are not only certain, but universal, and as they are not the result of empirical oxperience, they may be regarded as the primitive germs of or the irreducible infinium of truth, which nature has planted in the human intellect, and which, obscured in part by errors due to bodily conditions, the mind would find clearly within itself if it were freed from disturbing influences. Hobbes describes this kind of reasoning as merely metaphorical, and considers that there is no criterion for distinguishing this assumed clearness; to which objection Descartes replies that there is a distinction between a natural inclination to believe a thing which may nevertheless be false and a natural light which makes as know a thing to be true; which reasoning to a slice on to be super-added metaphor. Descrites, eschewing all talse reasons, applied his principles to the study of mathematics, and made remarkable progress therein: but the study of mathematics is one which peculiarly blends itself to incchancal application. In the study of the relation of mind to body. Descartes was not prepared to earry out his conception to its final consequences; since to do so would be to deny altogether the influence of the will upon our actions: the limit are of the will upon our actions; the command and in versions can be the formulated a theory that the Albert. Legend fells that if was on this mind can and may interfere in reflex stone that Jacob fell asleep when he actions, but that the mind possesses the dream of the flight of stairs reaching to power or pure thought in its own right. Locke, as a typically Brit, practical philosopher, denies the existence of L. L., and magnetion's stone at Taria.

This killing Fusiliers. The Boyal. Raised. asserts that all our knowledge comes from sense experience, the mind being only tabula rasa. Leibniz opposed this whole conception of inages impressing them-selves upon the blank mind from external objects as the basis of all our knowledge, ' though he agrees with Locke that, in the 1715 Rebellion in Sco-land, and at point of time, sensations precede the relating activities of the mind. Locke the practically ignores the reaction of the mind itself in knowledge; Leibniz decrus campaigns before going to India for the Wille we may admit that all truths come to will be reacted the processing the first World War it while we may admit that all truths come to one knowledge only through experience. to our knowledge only through experience, there may still be certain truths which may properly be called innate. In other words, the vague concept 'experience' demands a closer, more subtle definition than Locke gave it, and this was supplied by later philosophers like Humo and Kant. Locke's criticism of I. I. has, indeed, no force against the theories of Ger. idealism ; for, according to Kant, experience itself would be impossible unless it were possible for the mind to pass indements trans-cending experience. With Kant, perception does not conform to the nature of objects, but the sensible object conforms to the constitution of our faculty of per- faction.

ception. Eng. philosophical thought is essentially utilitarian, and therefore opposed to the theory of a priori and innate truths—an attitude which explains the popularity in England, for a time, of the positivism of Cante or any other system of philosophy which seems to favour pro-gress irrespective of the forces of tradition.

Inniskilling Fusiliers, The Royal. Raised in 1990 from the forces which lefended Ennekillen for Win, III. The best and second battallons were respectively the 27th and 108th regiments of Foot. The regiment tought at the Boyne and Siege of Limerick, Gallipoli, Egypt, and Palestine. After the war it was reduced to one battalion, and linked with the Royal Irish Fusiliers (q.r.) to form one corps.

Innocent, the name of thirteen popes :-Innocent I. (402-117), native of Albano. He upheld firmly the authority of the Rom. see, both in the W. and in the E., and was strenuous in enforcing the celib-

mey of the clerry. He was canonised.

Innocent II. (Gi.gorio Papareschi)
(11.30-13) was elected on the death of
Honorius II. He had, however, to flee from Rome on sev. occasions owing to Anacletus having been elected by a rival Innocent III. (Lolario de Conte) (c.1160-1216) succeeded Celestine III., and under him the power of Rome reached its greatest height. He everysed his papal juris-diction (1198-1216) over the kings of France and Spain, and compelled King John of England to receive Stephen Langton as archbishop of Canterbury. See ton as sectionally of Chiceroury. See A. Luchaue, Innocat III., la papatté et l'empire, 1906; C. H. Piric Gordon, Innocent the Great, 1907; L. E. Binns, Innocent III. (Sinnibaldo I washo) (1242)

54), b at Genou. He was compelled to leave Rome on account of the quarrel which was being waged between himself

and Frederick II.
Innocent V. (1245 77) b at Tarentaise, was pope for five months in 1276, and was a native of Savoy and the suc

cessor of Gregory A.

Innocent I (Etienne tubert, 13)2-62) Frenchman, b. at Monts, in Lamousin, the successor of Clement VI - He brought about a number of reforms in the pipal administration, and did a great deal for its benefit.

Innocent VII (Cosmo der Vigliorati) (1404/06), some writers have given a favourable account of him, but most ogree

that he was guilty of repotsin

Innocut VIII (Grownin Battista
Cibo) (1484-92) b at Genoa in 1432 In

a bill of 1484, he instigated very severe ares against witches in Germany, the principles environed by him being, later, emboded in the Mallens male fr earum (1157)

Innocent IA (Grovanus Antonio Lachinetti) was elected pope in 1591 and died

just after.

Innovent X (Georgian Lattista Pamfili) (1614-55), b. at Rome in 1571 did something towards ictorin, and was entirely

opposed to Jansenism
Innocent XI (Binedetto Odescolchi)
(1670-59), b. at Como in 1611 He was a zealous reformer, and most of his time was taken up with the quarrel against Louis XIV, who laid claim to the right of the king to appoint to benefice. This led to the Declaration of Gallican Liberties

Innocent XII. (1ntono Pignatello) (1691-1700). b. at Naples in 1615, made peace between France and the Papacy Innocent XIII. (Michelangelo der Confi)

(1721-21) was under the sway of spain and

Liance

Innocents' Day. This is the ling name for the festival which is celebrated 25 Dec , in commemoration of the massacre of the children of Bethlehem by Herod. It was probably first celebrated towards the end of the fifth or early part of the sixth century. In the Lit (hurch it is known as the Feast of Holy Innocents, Mass being and in purple vestments, probably because the innocents did not enter heaven till Christ at His Ascension opened it to those who believe. In the Gk. Church, the feast is celebrated on Dec. 29, being known as the Feast of the 11,000 Holy Children. Also known as Childermas.

Inns and Innkeepers. An inn may be defined as a place which supplies lodging,

accommodation, and food for passengers, travellers, and wavinters. It is immaterial whether the place is called an inn, coffee-house, or by any other name, if in fact it is an um. An um is to be dis-tinguished from a tavern, the latter being stratis an alchouse and victualling house combined, but primarily and essentially a place where liquor is sold. The sale of liquor is not the characteristic of an inn, and there are great numbers of places in Britain which are mins although they have no beence to sell intoxicints The propractor of a tavern is under no obligation to supply even a triveller with refresh ment, and indeed no one has a right to majet on being served in either a tavern or alchouse but it is an inductable offence, and also actionable for an unnkceper to refuse to supply accommodation and victual at any hour of the day or night to a traveller who is ready to a 1y and who conducts himself properly—but the innkciper may refuse it he has not room, or if the traveller or intending guest is an objectionable person, such as a thick, prostitute of person suffering from contigious disease. An inukciper is only bound to receive and lodge a guest so long as the suest retains his character as such Merely purchasing temporary refreshretushment of putting up a near schoreces enon th to make a main a ruest M com mon liw the highly of unkeepers was so wide that a girst could recover tor loss or darrige to his property in almost all cases where the mirkeeper was unabio to prove that the loss was due to the guest's det uilt But by the Innkeepers Laability Act, 1865 (Section 1) on amkeeper is not hable to pay more than 450 for loss or mmry to articles or property brought by guest unless the property (1) is a horse or other live animal, or a currage and genr, (2) was stolen, lost, or injured through the wilt il act, default, or neglect either of the makeeper or his servints, (3) was expressly deposited with him for safe cus tody To obtain the benefit of the Act an makeeper must put up in some con-spictions part of the cuti mee half of the inn a copy of Section 1 of the Act guest refuses to pay his bill the innkeeper has a hen on his in gage or other articles brought to the major the guest, whether such anticles are the property of the guest or not. Hence a commercial traveller's stock in trade can be served. If the bill bo not paid in six weeks, the unkceper has, by in Act of 1878, the right, after ad-yertising in a London and local nowspaper hi n tention, at the end of that time to sell the articles and repay any surplus to the defaulting guest. See C. C. Ross, I'm Itelating to Innherpers, 1928, and R. Watson, I Scrapbool of Duns, 1949.

Innsbruck, cap. of the mov. of Tyrol in Austria, It is named from the chief bridge over the Inn, on whose r. b. it hes. The situation is a splendid one, for the broad valley from which the city rises is guarded on all sides by lofty heights. Here the high roads from Bregenz in the Votarlborg and from Germany on to Italy over the Brenner Pass cross one another, a fact which accounts for its strategic import-

The interest of the tn. is mainly archeological. The cenotuph of the Emperor Maximilian 1. (d. 1519), which, with its marble sarcophagus and twenty-eight bronze mourners, is one of the finest illustrations of sixteenth-century sculpture, is in the Franciscan church (1509-93). There is also a univ. (originally founded in 1677), having 195 teachers and 1567 students. It also possesses a good library with 300,000 vols., and the Landhaus o the Diet is here. Pop. 62,000.

Inns of Court. There are four I. of C.,

Inns of Court. There are four I, of C., Gray's, Lincoln's, Middle, and Inner Temple. To become a member of the Eng. bar it is necessary, hesides passing certain examinations in law, to be ad-mitted as a nember of and to keep twelve terms (extending over a period of three years) at an I, of C. The I, of C, are a kind of legal univ. of London, in which the barristers and students correspond respectively to graduates and undergraduates. There were formally a number of small inns, such as New Inn, Staple Inn, and Clifford's Inn, all of these have cuber been bought up or in some other way acquired by the four remaining Loft'. With the dissolution of the ergeants' must disthe dissolution of the rieants' unis disappeared the anctisatus of 'serieants' commemorated in the humorous characters of Sericants Buziuz and Snubbin in the Pickirck Papers. All the existing I, of C, are corporate bodies owning (prior to the First World War) valuable property, and appointing from time to time ben-chess, out of their own members to form out of their own members to form chers. the executive bodies of the societies. Twenty benchers, five from each line, coopted from time to time, form the Council of Legal Education. The beuchers now disbar a barrister for professional or other serious unsconduct. Intending equity and chancery practitioners usually join Lincoln's lim, the two Temple Inns being the best for common law business. Grav's Inn apparently offers the best scope for Inn apparently olicis the best scope for scholarships and students' prizes. A time-honoured feature of the L. of C is the keeping terms, not by residence or attend-ance at lectures, but by 'eating dinners' in the halls, the total number being six of each term; but there are certain exemptions; studentship and first class honours men gaining a remision of two terms, and univ. men need only dine on three nights each term. See also LICAL EDUCATION.

Disastrous damage was done to property in the 1, of C. by Ger, air raids on London (1940-41). Large portions of Gray's 1nu were completely destroyed. The fumous Hall of the Middle Temple and the libraries of both the Middle and Inner Temple were gravely damaged; while large blocks of chambers were com-

close of the Stuart Period, 1924; E. Williams, Early Holborn in the Legal Ouerter of London, 1927; W. Kent, Lost Treasures of London, 1947.

Innusado, in the language of pleading in an action of libel or slander, means a para-graph in a statement of claim which seeks to put on the words complained of a more defamatory meaning than is warranted by natural construction. The defendant may traverse or deny the 1., and yet pay money into court by way of amends. But he must then make it clear that the money is paid in by way of reparation for the words in their natural meaning, and not in that alleged by the plaintiff.

Inoculation, communication of disease accidentally or intentionally to a healthy subject by the introduction of certain products of disease into the body through the skin or the mucous membrane. The chief discuses so transmitted in man are anthrax, hydrophobia, smallpox, and syphilis. Before Jenner introduced vaccination (q.r.), I. of smallpox was practised. The disease as thus transmitted was far less dangerous than the ordinary smallpox, and, further, rendered the inoculated subject much less liable to a future attack. Its disadvantages are obvious, in that it tended to keep the disease alive, and further to increase its spread, but it was my duable to those who had been incomlated, and was of great service prior to Jounce's discovery. In 1840 the practice of I with smal.pox was forbidden by law. Pistem's treatment for hydrophobia and all seriou injections are based on a similar principle to that explained above. Inone, Ismet (b. 1881). Turkish states-

man, original name Ismet, one of many children, of a proy, family of F. Anatolia. After a harsh youth, passed into the Cadet torps Politically suspect, he was virtually exiled as a second lieutenant in Tupoli. Stayed there for eleven years; then served with much distinction in the short disustrous war against It, a gression. Promoted captain and tought in the first Balkan war. As a major of the General Start he reorganised the Dirdanellos deto not which made it possible for Kemal to not the Brit, attack in 1915. In the First World War, served on all fronts, becolong major-general and a pusha, and as under secretary for war being charged with the demobilisation of a beaten and demonalised and discase-ridden army. After the Gk, attack on Smyrna, he answered Kemal's call for resistance by nething his way in the tags of a peasant private to the conceded headquarters of keinal, who appointed him his Chief of wills large blocks of chambers were completely demolished. The Itound Church that I have a period of unrolleved mistall. After a period of unrolleved mistall. After a period of unrolleved mistall, atroyed. Inquisition (Fr. inquisition : Lat. inquisitio, a seeking or searching for). ordinary language, particular inquiry, search stimulated by curlosity or hidden motives. In law (1) a indicial investigation, inquiry, examination, an inquest;
(2) the verdict of a petry jury under a
writ of inquiry. 'An inquisition of office
is the act of a jury summoned by the proper officer to inquire of matters relating to the crown, upon evidence laid before them' (Blackstone, Comment, bk. iv., ch. xxiii.). The institution known as the L. was an ercles, tribunal first outlined at the synod of Toulouse in 1229, and estab, by Pope Gregory IX, after the conquest of the Albigenses in 1233. A committee consisting of sey, respectable laymen and the parish priest was ordered to be set up in every parish to search for and bring heretics before the bishops. Soon afterheretics before the bishops. Soon afterwards inquisitors were specially appointed by the Pope from the Dominican and other orders, but these did not supersede the bishops' courts. Persons accused of heresy were examined privately, and if sufficient evidence was found against them they became liable to eccles, penalties. If they remained impenient the severest eccles, penalty, riz. excommunication, was pronounced against them and they were handed over to the civil authority for capital punishment. The cerles, penal-ties ranged from the enjoining of certain good works (e.g. alm-giving) to imprisonment for life. Informer's names were kept secret; torture was resorted to to extract confession, while the death penalty usually took the form of burning. The I. was set up in Italy, Spain and its depen-dencies, Portugal, and France, but not in England, where hereties were tried by the ordinary tribunals. It flourished chiefly ordinary tribunals. It flourished chiefly in Spain, owing to the numbers of Jews and Mohammedans settled there, who, while outwardly conforming to Christianity to avoid persecution, practised their own religion in secret and plotted extensively against the unity and safety of Christendom. According to Peschel's cal-culations about 2000 persons suffered death between 1181-1501 when Isabella warfare were the occasion, rather than the

In France it was used by Philip le Bel for the suppression of the Knights Templars, but soon fell into disuse. In modern times the 1. in Rome is called the Holy Office, and is composed of cardinals, judges, consultors and other officials, under the presi-dency of the Pope, but its activities are confined to the censorship of books and matters relating to church law and eccles. offences. Death was regarded as the penalty for heresy by Catholics and Protestants alike in the sixteenth century, but the Sp. I, has come to be regarded almost as a synonym for religious bigotry coupled with gross inhumanity.

Insanity, ansoundness of mind. It is hardly possible to provide a satisfactory definition of L., as it includes many widely differing states of body and mind, and excludes many forms of aberration which are associated with more or less transient diseases. When any impry is sustained by the cortex of the brain or when poisonous mut-ters are corried to it by the blood stream, clinical experience tells us that a disturbanceof consciousness or curs. The deliting of the fever patient is due to his brain being temporardy poisoned, and a number of cases of more permanent forms of 1, can be traced to definite lesions of the brain. Such conditions are often accompanied by purely physical symptoms, so that the hypothesis that I depends ultimately upon physical causes is not altogether unjustifiable.

CAUSES OF INSANITY. -Mental defect or disease is associated with some inherited or acquired peenharity of brain constitution. If statistics be of any value at all, the relation of 1, to hereditary nervous weakness is well estab. The descendant of insane parents may be normal and even extraordinarily capable, but there is great likeblood of some indications of want of nervous balance showing themselves, and his general condition may be represented as a susceptibility to invasion by the agents that produce mental instability, just as a child of consumptive parents, though apparently healthy, is assumed to be less likely than others to resist invasion by the tubercle bacillus if he allows the conditions to become favourable for its development. Among other general causes of 1, may be mentioned the in-creasing stress of civilised life. There is creasing stress of civilised life. a tear that I. is increasing rapidly among civilised nations, and although statistics do not show that any real increase has taken place, there undoubtedly is a greater tendency to nervous diseases which demonstrates that the nervous mechanism is being over-wrought in a number of cases. The belief that there is a relation between the stress of modern life and the incidence of mental disorder was apparently confirmed by the great increase of mental disorders during the First World War particularly among soldiers. The general body of expert opinion, however, inclines to the view that the conditions of

cause, of the 'war shock' (traumatic neurosis). The report of the Board of Control for 1930 (pub in 1931) comments on the continued increase in lunacy the number of notified means persons under care in Figland and Water showing, in the say years under icview, an average and more ase of about 2000. But the Board found no justification for the suggestion so commonly made the telepace of modern life conduced to month breakdown though present day conditions of urban life might and probably do, tend to in crease the frequency of some minor per ot alcoholism in the curvation of I is divided. So many cases show a fast of alcoholism, and its effects on the nervous system we so promounced that many claim alcohol to be the commonest cause of I On the other hand the cuise may be confused with the effect, the fick of control which makes the confirmed drunk aid is characteristic symptom of an unsound characteristic symptom of an information to the constitution (on-singuints, or mailing of near relations is addited as another cause. Here again, the problem of the first like problem of the prenal hist is feel from I, there is no perfectly trade of the prenal hist is free from I, there is no perfectly trade of the direction of the elements of the problem of the p sons with thist of mental deficiency such persons are often responsible for much larger families than the everage. The immediate cause of I may be toxic poison ing through detective metabolism of through ictual infection by micro organ metabolism or isms such forms at I as follow cert un isms—such forms of 1 as follow certain () whose with brain framin (b) Psycholic is millioner purper detect (c) is with organic brain disease, e.g. syphilitic infection are und ubtedly due then famous (7) Psycholic with ellionic to the presence of foxic substances in the blood. It has been further suggested that worty work motion (to by their faction metabolism induce changes table 1) term Manu Depressive Psycholic is effect on metabolism induce changes in the term Manu Depressive Psycholic is forced which may ultimately cause a classification with dweet formerly physical condition of the brain involving to the condition of the brain involving to the term of the property of the symptoms of the mental he first the very quescipated seasons of hallumations. Intolutional Mela holio is a term, which in its strictest application is received for a group of cases of both sexes habit of sleep is generally a sign of im itsited for a group of cases of both access provenient. A rapid pulse rate and occurring at the involutional period, who general lack of control of muscles are have never previously suffered from any usually to be found in most types of I. torm of mental illness. Its features are

depression without retardation, anxiety, a feeling of unreality and hypochondriacal and nibilistic delusions.

Paranoia is a chronic form of mental disease which has an insidious onset and is characterised by delusions, which are closely related, unchangeable and bound up together into a system. The term Systematised Delusional Insanity is sometimes given to Paranoia and distinguishes this psychosis from other men-tal diseases in which the delusions are multiple, variable and unsystematised. Delusions may be of grandeur and power or of persecution or jeulousy. When delisions of persecution are present, there is considerable danger of violence as the patient may attack his supposed persecutors or attempt snicide to escape from them. Schrzophrenia is a psychosis which occurs most typically in adolescents and young adults and is characterised by emotional apathy, absorption in phantasy to the exclusion of normal social activities, by delusions and hallu-cinations, and a deterioration in mental efficiency which may termmate in severe dementia. In its typical form it consists in a slow steady deterioration of the entire personality and manifests itself in disorder of feeling, conduct and thought and in an increasing inability to make effective contact with reality. Four varieties have been described: (1) Simple, (2) Hebephrenic, (3) Katatonic, (4) Dementia paranoides. Paraphrenia is a progressive delusional condition, accompanied by hallucinations of various senses and, in due course, by a varying degree of mental deterioration. The condition has been said to lie midway between dementia paranoides and paranoia in the age of onset and the seventy of its symptoms. Heneral Paralysis of the Insune is an inflammatory and degenerative disease of the brain of syphilite causation, which is characterised by progressive mental deterioration and definite physical signs and serological findings. It usually manifests itself from five to twenty years after infection but a few eases have been recorded where the disease made its first appearance thirty or more years after infection. It is commoner in males than in females, develops insidiously and its course is frequently marked by remissions. The carliest signs are usually changes in the patient's personality, (changes in behaviour, character and mood) of which the patient is commonly unaware. There is increasing disorienta-tion, particularly for time and progressive impairment of memory. A feeling of euphoria, coupled with grandiose delu-sions of bixarre type may be present or the patient may exhibit intense depression, even amounting to stupor and inutism. In the depressed type the ideas expressed are frequently absurdly nihilistic and grote-que. In the terminal stage of dementia the patient leads a purely vegetative existence. The disease is world wide and its appailing social significance cannot be overstressed. Syphilis transmitted to the offspring may give rise to invenile general paralysis.

TREATMENT .- Studies of mental disorder carried out in connection with hypnotism led to the attempt to use suggestion, and persistent suggestion still plays a great part in the treatment of mental patients. Progress towards an under-standing of the true character of mental disorder resulted in the realisation that the insane man was a sick man, in need of care and supervision in place of discipline (or as in former times, punishment) and re-straint. A welcome change appears to have taken place in the attitude of the general public towards 'nervous' and mental disease. There is an increased readmess to seek expert advice and treatment carly and the old fear of social stigma appears to be almost climinated. Probably more than any other single factor, the extensive use of psychutry in the three services during the Second World War contributed to this desirable development. For the first time, psychiatry in the Services was fully organised and developed. Special hospitals for the treatment of neurosis and psychosis were estab, both at home and overscas. At home, psychia-trists were attached to the various Military Hospitals, area psychiatrists worked fu-each command, Military Prisons were visited and psychlatric opinion and advice made available at Officer Selection Boards, Intake centres, Courts Martial etc. Oversea-, the work was often carried out in the extreme torward areas. The result was that in the Services large numbers of the Medical profession and an immense crosssection of the general pop, became familiar with the aims, uses, methods, and benchts of psychiatry, and after their return to erviban life they were not slow to take proctical advantage of this knowledge. Further, the experience gained in the organisation of war-psychiatry proved of great value in organising the extension and elaboration of civilian psychiatry which took place after the end of the war. The modern mental hospital provides its inmates with as great a measure of freedom as possible, and with great variety of occupation.

Besides rest and occupational therapy special methods of treatment have recently been introduced, which have yielded valuable results. The methods of treatment now in use include (1) Insulin therapy, (2) Cardinzol therapy, (3) Electric convulsion therapy, (4) Prefrontal lencotomy, (5) Continuous parcosis, and (6) Naro-Analysis. Insulin therapy, which involves the production of a hyporycaemia by means of insulin, has proved especially valuable in schizophrenia, particularly in young patients treated early in the disease. Cardinzol also has yielded good results in certain cases. With electric convulsion therapy the best results have been obtained in depressions, including involutional inclandollis. This treatment, which can be given as an outpatient procedure, is now practised at the psychiatric clinics at most large general inospitals. The operation of prefrontal locuctomy involves the severance of the association paths between the frontal loues and the thalamus. The general aim

of the operation is to modify the dis-ordered behaviour of those psychotic patients whose illuses has been of pro-longed type. Generally speaking the possibility of serious and permittent possibility of strious and perminent damage to the nicutal functions renders it advi able to reserve the method for cases where all other sultable methods have been tried and fuled, where there is no reasonable hore of spont meous recovery and where the juttent is quite incapable of a ctul occur it in or a modest enjoyment of life. Modern practice involve the attempt on the part of the nucleal man to understand his patient, and to han through the discovers of the pur-posise chair ter of he symptoms ob-sessions and delusions the real character of the mucr conflict which they simultane ously express and conced of the psycho-logical teaching of French and his followers There is still a difference of opinion as to whether there is end that break between the neuro es a nerveus disease and the Isycho et ansanty proper or whether the posteriors which are not due to a tual le ion are inerely developments the number According to some mental difference write between the two thank it is stanted for the some that in the call states of dementa. Inscribed Stock, see REGISTERED STOCK. Inscriptions (from Lat. in, 'upon' and scribere, 'to write') is the term given to records cut. engraved, or moulded upon hard material such as stone, metal, or clay. They are found on rocks, on slabs of stone. on temples, tombs, or anet, buildings, on vases, seals or gems, on copper plates, on iron or bronze tablets, on gold, silver, brass, crystals, ivory, and so forth. In the Hible, there are numerous references to writing on stone: the 'tablets,' which Moses received and afterwards re-wrote the Law on Mount Sinai were slabs of stone (Erod., xxxi, 18 and xxxiv. 1), and (in Deut., xxvii. 2-3) Moses was hidden to 'set up great stones and plaster them with plaster' that they might have a surface capable of taking a legible text of the Law; also Joshua 'wrote upon the stones a copy of the Law of Moses' (Josh., vii., 32). Clay was the most common writing material among the anct. Mesopotamian peoples (see under CUNEIFORM WRITING) and was also used in Syria cat Ras Shamrah, the anct. Ugarit, a particular cuneiform alphabet was employed) and in Crete, where many thousands of clay tablets have been uncurthed, as well in some other Near E. countries. Bronze was used by Gks., Etruscans, and Roms, as a material on which to engrave votive I. laws treaties, and other solemn documents. The Chinese earliest extant written documents are either on bronze or on bones. The most noteworthy characteristic of the 'pro-historic' Indus Valley civilisation (q.r.) in the middle of the third milcon (4.c.) in the initial of the third initianism B.C., is the still undeciphered script preserved in about 800 finely cut seals of stone or copper. India, and especially S. India, is particularly rich in inscriptions of all kinds. The importance of the S. Sarritio I am. of the S. Semitic I, can be gauged when of the S. Seintle 1, can be gauged whom we consider that practically all we know of early S. Arabian hist, and that of pre-Islamic N. Arabia, is based upon them. Indeed, these numerous S. and N. Arabian I. are our main source for the study of the once flourishing kingdoms, whose splendour has been immortalised by the Biblical account of Solotoon and the Queen of Sheba. Also the numerous inscribed stelae and stone 'altars,' and the inscribed polychrone clay pottery of the anct. Mayus (Central America), as well as the wooden tablets of Easter I-land in-scribed in a 'mysterious' script may be mentioned.

Until the end of the nineteenth century when people spoke of 'ancient history they usually meant the hist, of anct. dreece and Rome; it was thought that nothing could be known about the earlier times except what is found in the pages of the Bible. In the early nine-

Larve, that is, young Is have only occli. The thorax is note up of three secments cach provided with a pair of jointed less on the lower surface. I wo pairs of compressed dotal sales that is whige, are fastened to the upper surface of the two hinder segments. In some species there is only a stack pair of wings, whilst in others the second is still very undeveloped. The abd one in his no limbs, unless stings, pinve p ints. A compound eye can be abdomen has no limbs, unless stings, pinwhence it ranks with other Tracheta of several and the wapons of official of the organis. Appendix on the mouth is situated at the front and on the lead are of four kinds. First, there are underside an upper lip (labrum) being two antennes springing from the forehead.

and have many nerve-endings which make it probable that they serve as organs of touch, by which impressions are conveyed from one f. to another, and perhaps also as organs of smell. Secondly, there are the mandibles or biting and upper jaws, which in insects with the masticatory type of mouth are simply hard plates adapted for mouth are simply hard plates adapted to crushing and cutting. Below these are the anterior (1st) maxille, or lower jaws, which are provided with jointed palps, that is, sense organs, and which often have quite a complex structure. The posterior (2nd) maxille are the fourth pair of appendages. These also are complex and dippendages. These also are complex and furnished with palps, and are, moreover, usually united at their base to form the labia. The mouth is formed of the mandibles and the two pairs of maxille, and may be of the sucking or chewing type. Thus moths and butterflies have suctorial mouth arrangements, and whilst their mandibles are only slightly developed, their 1st maxille have become probosces by being protracted into a spiral tube. The months of beetles are masticatory. The trutk appendages are the three pars of legs already referred to. Each limb is divided into five parts, namely hip (e.s.) trachauter, thigh (femur), shin (tibia), and foot (tarsus) with claws and pads at the extremity. Sometimes there are tarsal hairs and glands, which enable the I. to grip a smooth surface; the legs of a daddy-longlegs, lank and long, whilst the water boatman can swim with his, and other insects use theirs for making a noise.

Skin and Glands. - The chitinous cuticle or integument, which forms a kind of ensheathing skeleton, often bears bristles, tubercles, scales, or bairs the last of which may be tactile or olfactory. Is, are sub-ject to moultings, since the cuticle itself cannot expand to allow for growth, and cast their whole skins many times before reaching their greatest size. The skin serves as a firm support for the highlydeveloped muscles which work the wings. legs, trunk segments, and organs of the mouth and further control circulation and respiration. Bees, coccus Is., etc., have wax glands near the bottom of the abdomen or on the back; a number of larvæ, especially such as weave cocoons, have spinning glands opening near the mouth; bugs have odoriferous, and wasps and stinging ants poison, glands, and few is. are without salivary glands, which also open near the mouth.

The nerrous system differs, broadly speaking, from that of vertebrutes by having a ventral instead of a dorsal nerve cord. The nerve centres, called 'ganglia,' which are simply masses of nervous matter, lie lengthwise along the lower part of the trunk and are connected together by a double chain of nerves. From each gaug-lion branch nerves are despatched to dif-

of them more highly developed than those of hunan beings. Is, which visit flowers are wonderfully sensitive to fragrance and to colour, and it is largely by smell, it seems, that I. recognise friends and foos. Some entomologists credit them with a sixth and dermatoptic sense, because their skin seems able to appreciate minute difterences of light and shade. Is, hear by means of nerve-endings, called tympanal and chordotonal organs, which lie on various parts of the body surface and greatly surpass human beings in their auditory faculties. Many, like ants and bees, which lead a social life, show signs of extraordinary powers of intelligence and ingenuity in adapting fresh means to compass a particular end. On the other hand, much of what appears to be their most utelligent behaviour is purely instructive, and when this is interfered with, the insect is unable to adapt itself intelligently to the new situation.

The circulatory system centres round the doesal blood-vessel, or heart, which lies lengthwise along the upper surface of the body, just below the clutinous ensing, and which is a tube composed of segments with valves between. Behind, this tube is closed, but in front it is prolonged into a fine channel, the aorth. The blood, which is a colourless, pale green, red, or yellow fluid with amorboid cells, is pumped out from the heart into the various tissues until a muscular contraction of the body forces the blood back into the heart. Lacune, which have no definite walls, take the place of blood-vessels properly so-called. The blood, unlike that of vertebrates, takes no part in the transport of oxygen.

The respiratory system of 1s. is remarkably efficient. Air-conducting tubes, called trachee, are distributed net-wise all over the body, and open to the outer air by means of paired apertures called spiracles, or stigmata. There are usually two pairs or sugmeta. There are the abdomen, but the thorax and ten on the abdomen, but the number varies considerably. The spiracles are often protected by hairs. water 1s. lateral or terminal outgrowths, known as tracheal gills, replace the stigmata; the oxygen dissolved in the water can penetrate through their thin surfaces. The tracher are ingrowths from the outer outcle; they are hard with chitin, and appear silvery and ghstening; the air is probably driven through them by muscular contractions, easily seen in the abdomen of a wasp, and continuing even when this part has been cut off from the rest of the body. By the development of spiral bonds of strengthening material, the traches are prevented from collapsing. while the diffusion of oxygen through the thun parts of the walls into the surrounding tissues can proceed freely.

The alimentary system varies with different species and also to some extent with different diets. The alimentary canal, from the parts of the body, and in the ex- which passes from nont to back usually treme front is a larger pair of ganglia, with sev. loops on the way, may be usually called the 'brain'. From the divided into fore, mid-, and hind-gut. 'brain' the two nerve chains, or cords, Mouth, pharynx, and gullet compose the divide so as to encircle the gullet, after fore-gut; sometime the gullet is swellen which they reunite. As regards their into a kind of crop, the honey-stomach of sense organs it is certain they have some the bee; sometimes it is prolonged into a

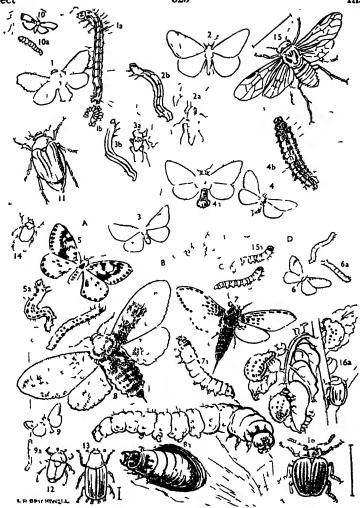

gizzard with grinding plates to promote mastication, and sometimes it has a pouch called the sucking stomach. The fore- and hind-gut are lined with chitin; not so the mid-gut. This is a chyle or digestive and absorptive stomach, and leads into the hind-gut or intestine, which is often coiled and glandular; it is longer in I. which take solid than in those which take liquid food. The intestine absorbs digested food and the soluble waste products leave the body by means of a set of winding threads or tubes, the Malpighian tubules, which usually grow from its upper part. Solid waste products are exercted the ough the anns.

The reproductive system is represented by paired reproductive organs, the products passing out through paired ducts, the rasa deferentia of the male and the oviduets of the female. The sexes are quite distinct and differ in other points of structure as well as in reproductive organs. Thus the female of the butterfly Orggia has no wings, and among Strapsidera (bee-parasites) the female never leaves the grub stage. Males can store up spermatozoa in pockets, and similarly certain females, like the queen bee, can preserve for years the spermatozoa received from the male, so that she can continue to lay fertile eggs long after her last sexual union. She does this by means of an internal seminal storage vesicle, the spermathera. Some temales have a well-developed ovipositor at the end of the abdomen. Sexual selection is practised among Is., a fact which has probably contributed towards more speedy evolution of strength and beauty. Sometimes the males hight for some feminine prize, whilst among bees and other Is, the wooing is quite an elaborate process, the female in this case choosing her mate. Some 1s, are exceptionally fertile, as for instance the silkmoth and queen bee; others, among them certain Aphides, are remarkable for purthenogenesis, or virgin birth, i.e. development of egg- without fertili-ation, which sometimes occurs for a limited period only, and is afterwards followed by normal sexual reproduction. A have of bees usually has only one perfectly mature female, the queen bee; the mass of females who carry on the work have an immature sexual development, and are therfore called 'neuters,' or 'workers.'

Metamorphosis is a phenomenon common to the majority of 1s. However, among Collembola and Thysanura the young, which, as in most is, are hatched from the eggs of the mature female, differ from the adults only in point of size, and even among liee, locusts, cockroaches, and many buys, the only distinction between the infant and parent is the immaturity of the reproductive organs and smaller wings in the infant. These species are therefore and to be 'ametabolic,' that is, not subject to change. Cicadas, Ephemera, and dragon-lies, on the other hand, are classed as 'hemimetabolic,' being subject to portial change. Thus a larva of the cicadas lives on the ground and has anterior limbs suited to burrowing, whilst fully grown cicadas live among grass. The

dragon-fly is winged and aerial, and breathes with open air-tubes, but its larva lives in the water, and has tracheal gills for respiration. But a large number of species, including house-flies, beetles, and butterflies, are 'holo-metabolie' or subject to complete transformation. The eggs are deposited in such large numbers eggs are deposited in such large numbers that they have individually only a very limited food-storage capacity. The result is that each larva is obliged to assume a shape which will allow of its better growth and development, and the form assumed varies a great deal among the different species. The larva of a fly is a maggot which has no distinct head; that of a bee is a grub, whose head is clearly marked; and the caterpillar is the larval butterfly. The normal growth of a larva of this class is as follows: At list, after it has emerged from its shell, it is very ac-tive and greedy for food. The body is segmented and supplied with all the organs except the sexual; there are no wings nor compound eyes. In every larva, more-over, what is known as the 'fat body,' that is, a mass of fatty tissues in the trunkeavity, is peculiarly well-developed. Here, after a busy life of moulting and growing, it accumulates stores of reserve food for use during the coming metamorphosis. Larve for the most part crawl about, and to aid them in movement they may have from two to five pairs of 'pro-legs,' that is, foot-like processes, on the abdomen as well as true legs on the thorax. The period of change is called the pupal or chrysalis stage. Some larve, such as those of the slikmoth, spin cocoons of silk to serve as a shelter during the metamorphosis. The herea now becomes a 'pupa,' which is quiescent and campot absorb tood, but sometimes, as with drugon-flies and grasshoppers, the larva is transformed into a 'nymph,' which cats and continues active. Wings grow, and, what is still more marvellous, there is gradually taking place a complete reconstruction of the internal structure of the former larva. Ameeboid cells are fashioned out of the larval organs, and upon the run of the latter there grow new structures better adapted for the changed life that is to come. Finally, the changed life that is to come. Finally, the pupal husk is broken, and there emerges the 'mago' or perfect 1. The task of reproduction naturally rests with the fully grown f., which sometimes dies after it is completed. The sexual organs of larva and pupe are usually imperfect.

The classification of 1s. is based upon variation in structure, especially upon the various types of wings and mouth arrangements. Some of the most distinctive orders are: (1) The Collembola and Thysanma, together forming the group Apterygota, the wingless insects with incomplete metamorphosis. These orders include the 'springtails,' certain plant lice, the 'birstletalls,' and the 'silver-fish.' (2) 'Neuroptera' (nerve-winged): May-flies, caddis-flies, scorpion-flies, and dragon-flies, white ants, and book-lice all now usually regarded as forming separate orders. These have four glassy and membranous wings, an incomplete metamorphosis, and a mouth of the biting type.

LATION

Inspiration (Lat. inspiratio, from inspirare, to breathe into), term used in theology to denote that Divine influence on the writers of the Bible by means of which their writings became a Divine revelution. All orthodox theologians are correct in recurrent that the benefits are agreed in regarding the Holy Scriptures as the revelation of God in some sense, but there is much difference of opinion as to the method and extent of the Divine in-spiration. The dogmatic formula of the Church on the subject, to be traced through various councils and writers from a very early date, simply states, Thus est auctor liborum sacra scriptura, but this general statement is explained in some detail by the Vatican Council, where it was pronounced that the Scriptural writings are held as sucred and canonical by the Church, not because after being composed by merely human industry they were then approved by her authoricy, and proved by her authoricy, and the unspiration of the floty Ghost, they have God for their Author. The theory of Legenerally known as werded or mechanical was a lid for centures by Protestants. The recovered books, making the stations of Legeneral variety and individuality from the stations of Legeneral variety of the control of the character or manifestations of Legeneral variety of the control of the character or manifestations of Legeneral variety of the character of the character or manifestations of Legeneral variety of the character of the cha approved by her authority, not simply because they contain Revelation without the writers of the sacred books, making them mere instruments upon which the breath of God plays. Their words are to the writers of the sacred books, making to thous of Lose C. Darwin, Origin of them mere instruments upon which the Species, 1859, and Dissert of Man, 1871; breath of God plays. Their words are to by the Romanes, Mental Levilution in the regarded as the very words of God as thin mass, 1883; C. Llovd Morgan, Habit certainty as if a voice had a unionneed them and Instruct, 1896; A. Weismann, Issays from the skies (see Heavitten). Instrument of Government, document which prescribed the powers of Oliver Cromwell when he accepted the office of Protector of the Commonwealth of England (Dec. 16, 1653) It provided for triennial parliaments, to be in session for not less than five months, with 100 mem-bers for England and thuts each for Scotland and Ireland; an army of 30,000 men; freedom of religion for all except Papists and Piclatists; and for an elective Piotector. The first Parliament under the f. of G. sat for only five months, it not being altogether favourable to Cromwell's authority, and the Protector then followed Charles I.'s example and for some time ruled without a Parliament.

Pest, at Toronto, isolated and named the active conditiont insulin, and Collip (1922) purified the criple product. For incideal purposes I is now prepared from the purificas of oxen, and is found to be benchelal only when injected Excess of I aggravates diabetes by causing the liver to discharge giveogen. Abel (1925-28) prepared crystalline I. and determined its properties, and more recently sjógren at i pada has determined its molecular weight to be approximately 35,000, and the shape of its molecule spherical. From these results, and the determination of other physical constants, he concludes that results is a partial belonging to the Instruments, Electrical, indicating and that manin is a protein belonging to the

same group as egg albumin and Bence difficulty. It may happen that a vessel Jones protein. In solution this crystal-carrying a valuable cargo is sunk where it line insulin is stable provided the pu is possible to salve a portion of the goods (hydrogen-ion concentration, q.v.) ranges from 4.5-7. Beyond this range it dissociates into substances of lower molecular constitution, but near the borders of the range of stability, the reaction is reversible. If the solution be too acid or too alkaline permanent dissociation will occur. I. is now used in courses of hypochycaemic therapy in the treatment of mental disorders. See also INSANITY.

Insurance, contract under which one party undertakes for a consideration to indemnify another against certain forms of loss. In the present day the practice of 1, has become so general that practically every contingency which may arise as the result of accident may be covered, but the earliest and most widely practised forms of I. are 'Marino,' which applies to ships and property at sea; 'Fire,' which is the I. against fire of property on land; and 'Life.' This last differs from other Is. in that, although a contract to indemnify against loss by premature death, at the same time it provides a certain benefit. For this reason life business is sometimes referred to as 'assurance,' as distinct from 'insurance,' but there is no rule for this, and the terms 'insurance 'and 'assurance' are synonymous in the profession.

The first 1. business to be practised was Marine, and it is probable that for commercial purposes it originated in Flanders. being introduced into England early in the sixteenth century. Marine business difsixteenin century. Warma business dif-fers in one notable respect from other 1st, in that, although it is done by a number of independent, self-contained companies, a large share is transacted by individuals known as underwriters. These under-writers are members of a society called Lloyd's, the name originating from a certain coffee house in Abchurch Lane, where the original members met. Their affairs are arranged by a committee, and the subscribers include the companies who also transact the business. The society has agents throughout the world who keep in touch with the shipping at all the prin. ports, and render an account of the same, together with particulars of any casualties which may have happened. An I. is divided amongst a group of underwriters, each holding a small proportion of the total amount at risk. Policies are issued to cover ve-sels, their freight and cargo, against all maritime risks, which include risks of navigation, fire and seizure, during a certain period, not exceeding one year, or for a specified voyage. The I. covers the ship or cargo, and includes the cost of the I. upon the whole. Policies may be of heing damaged by fire can be insured, 'time' policies or 'voyange' policies, as the policies or 'voyange' policies, as the property that is capable in the premium charged being based on the specified above, and are ofter valued, in hazard of the risk. For example, private specified above, and are ofther valued, in hazard of the risk. For example, private which case the sun insured is based upon houses, blocks of offices, and property of a a specific bill of lading, or open, when the his nature, where the risk of serious fire is a value of the vessel is estimated as at the slight, are termed non-hazardous, and have earned on the constitution of the very later by the hundred to of the very later by the hundred coordingly usually at about its. 64. have earned on the completion of the voyage and the cargo at its invoice price. The settlement of marine losses is of particular interest, as the question of salvage follow-

insured, and in such a case there are varying methods of effecting a settlement of the claim, and sev. courses open to adop-tion by the underwriters. For instance, they may pay the total loss and recover what they can of the salvage, themselves arranging with a irm to conduct the operations, or they may pay the insured's actual loss, after deducting the value of operations. The destructible nature of the goods insured is, of course, the princlactor, and the cost of the I, is largely affected by this. Denurrage charges and the principles governing them were revised. in 1924 at a congress at Stockholm where a set of regulations arising out of the International General Average Rules of 1890 were redrafted and adopted inter-nationally. In 1924 the Carriage of Goods by Sea Act was passed, which adjusted many anomalies arising out of the legal questions involved in contracts of attreightment between shipowners and Shippers.

Fire Insurance .- - Contract of indemnity in respect of loss or damage to material property by sire. The policy-holder (termed the insured) pays a certain agreed amount (the premium) to the insurer, and is reimbursed his loss out of the fund accomplished that he insurer. cumulated by the insurer. Premiums are generally payable annually, and as a rule fifteen days of grace are allowed for payment of the amount due. Fire I. was first introduced into this country more than 200 years ago, but there is evidence of a type of tire I. at a much earlier date by means of levies on guilds, wards, etc. the carly days companies were formed for the sole purpose of transacting me I, but at the present time most classes of I. are transacted by each. There are more than 100 Brit, companies underwriting fire I. in the United Kingdom, and most of them have extended their activities overseas, where they have an excellent reputation. It is estimated that over 75 per cent of fire premiums paid to But, companies come from overseas, and of this amount more than half is from the U.S.A. The ordinary form of policy issued in respect of trade property covers damage by tire, lightning, explosion of coal gas (except on premises where gas is manufactured or stored), and domestic bollers. The private-house fire policy usually includes thunderbolt, subterranean fire, earthquake fires (not earthquake shock), and fires caused by rioters and strikers.

per cent. On the other hand, factories where inflammable goods are manufactured, buildings of flussy construction, or situated in a neighbourhood presenting ing a loss sometimes presents considerable more than usual fire risk, are deemed

hazardous, and rated according to their ! merits Companies endersom to cal-culate the premium for any one class of trade so that over a period of sears the m come is sufficient to meet the losses and expenses and show a small percentage of profit. The profits of a fire I company are usually about a per cent of the pre mium income

To obtain data on which to calculate premiums offices depend on their loss (x) perience in past years. Because the scope of each office sex serience is not sufficiently general for accurate results to be obtained a number of companies now combine

branch of I work not does it know of the time and money spent by the I companies in testing and approving the extinguishing upleances fire claims, and building miterials Offices have surveyors and experts who may be consulted on such mitters. But fire brigides are now m untuned by cos and co bors in the part the duty was undertaken by the histocompanies. I ich office had its own fremen and appliances and fixed a metal plane of the mark on every house it in smed It bing the duty of a company s men only to extinguish fires in buildings m nel by then employer, the brighe's

domestic servants I. is also included. The valuers are satisfactory to both insurer certain of these risks at a lower rate.

Another form of fire I. protection now being placed before truders and manu-facturers is loss of profits or consequential loss I. The ordinary fire policy Indem-nifies the truder in respect of the material damage to his property, but this does not represent the full amount of his loss by a fire. The loss of profits policy is designed to meet this need, and reimburses him for his lost profits and increased expenditure for a certain stated period (called the period of indemnity) from the date of the loss. The period of indemnity is arranged by the trader when effecting the policy, and represents his estimate of the time necessary to set the business on its feet after a fire. The usual period is from three to twelve nonth, although I. is often arranged for trades which do not overcome the effect of a fire for considerably longer periods. The amount payable by the insurers is normally adjusted on the basis of the decrease in turnover during the period of indemnity, as compared with the similar period in the preceding year. ceding year. The ant recoverable is a proportion of this decrease, and is usually the ratio of profit and standing charges to turnover as shown in the accounts for the last inancial year. Expenditure on increase in cost of working is also recoverable. The I. is adjustable to suit all types of businesses. The rates Percenthe contents of the premises. the coments of the premises. Percentages of fire loss, a form of loss of profits 1., is suited only to the requirements of one or two trades. The policy pays a fixed proportion of the amount recoverable under the ordinary fire policy. In most eases the amount of material damage is no index of the resultant loss of profits, as a comparatively small fire may entirely stop the business until the damage is made good.

Sprinkler leakage L is now offered, as many factories, shops, and public buildings are fitted with automatic sprinkler installations for extinguishing fires. The promiums usually depend on the class of

the property be under-insured at the time of the fire, are seldom met with in policies for private dwellings or small trade risks. It may be unwise to under-insure, for the total liability of the company is limited to the sum insured, and the policy-holder and notices are rarely issued to ress than £100, to the sum insured, and the policy-holder and notices are issued to the collection cannot recover any amount in excess of for the premiums which are due yearly, that figure. The policy is a contract of half-yearly, or quarterly, except under a indomnity, and the amount recoverable is special scheme whereby an automatic the actual value of the articles destroyed is stem of monthly premiums is arranged, at the time of the fire, i.e. the mirkt, value, There is now a wide variety of classes of sor depreciation and wear and tear. The ingin headings—namely, with and without sentimental value of an article cannot be profit. Policies under the former carry covered. Valuable pictures, books, and the right to share in the profit of the profit. of similar articles less a reasonable amount

and insured, provided that frequent revaluations are carried out to meet changes in mrkt. value.

Policy-holders should note that their fire I. company must be advised of any change in circumstances which may affect the l. Notice should be given if the policy is to apply to a new address or the benefit to be vested in another person; if any part of the premises becomes occupied for a purpose different from that in force when the policy was effected: If any addi-tional or alternative method of lighting, heating, or ventuating contemplated; or when any structural templated; or when any structural templated; or when any structural templated; alterations are to be made. The I. com-pany expect and require their policy-holders always to act in good faith with them.

Life I. originally provided, as in the tase of other forms of L, against a contingency, but it has long since been extended to include a payment on a certain happening, such as death. The earliest life L on record is dated 1583, when it is probable that is, were granted to cover only short periods as a protection to creditors. The extension of the business was very gradual at first, but for the last century there has been such rapid growth that in 1870 the Life Assurance Companies Act was passed for the protection of pohey-holders. In 1909 the business was further regulated by another Act. This provides that a company transacting life I. must deposit \$20,000 with the Board of are based on the fire premiums paid for Trade, and must pub, ann. balance sheets and revenue accounts. It is also laid down that there shall be periodic valua-tions, not less frequently than quinquen-mally, of the assets and llabilities of each The 1909 Act forther governs combany. the procedure to be adopted when amalgamation of companies is contemplated, and the rights and pervileges of share-holders and policy-holders are definitely estab. The two main kinds of company are the proprietary and the muteal. With the former, there are share-holders who take a certain percentage of the profits as dividends, but with a mutual company all profits belong to the policy-holders. Two distinct branches of life I, are known promiums usually depend on the cass of two usuar to an action to goods and the number of sprinkler heads. (as 'industrial' (see Typestaty, Isyua Average clauses, which make the policy-(xxx) and 'ordinary,' but many companholder bear a proportion of the loss should be transact only the latter type. In the industrial branch, policies are issued for much smaller sums, and premiums are collected by agents of the company either weekly or monthly. In the ordinary class policies are rarely issued for less than £100, and notices are issued for the collection of the premiums which are due yearly, policy to choose from, but there are two covered. Valuable pictures, books, and the right to share in the profits of the comworks of art are usually insured for an pany, and this benent is usually given in agreed amount, because of the difficulty the form of a bonus added periodically to of ascertaining their inrkt. value. Is, the sum assured, although it can, if prebased on inventories made by licensed ferred, probably be taken in eash. No such

right accrues in the case of without profit policies, the premiums for which are therefore smaller. A life policy in its original form merely provided the sum assured at death, possibly within a certain time. This would now be called a term policy. It has been followed by the whole life policy, securing the sum assured at death whenever it may occur, up to which time the premiums are payable each year.

An equally important class of policy is

the endowment assurance, securing payment at the end of a fixed term or in the event of previous death. With any class of policy it is possible by paying a higher rate of premium, to limit the number of payments to a maximum, and this is frequently done in the case or whole life contracts, in order to prevent having to contime premiums throughout a long life.

A modern addition in life I, is an ann. benefit in the form of a temporary annuity. payable should the life assured die within a certain time from the date of the policy. This is a 'family income' policy, intended to give extra financial assistance before the assured has had time to make adequate provision otherwise. It is not necessary for any policy to be effected on one life alone. The amount required can be made payable on the first or other death of two or more persons, or on the death of one person before another. Such contracts have their uses for business or financial transactions. The premium for whatever policy is selected depends upon the age at poncy is selected depends upon the age at entry into L, and it is usual to quote for the age next birthday. The calculation of premiums is a highly technical work, which devolves on the actuaries of the L companies. They rely upon various statistics in the form of mortality tables. Actuaries .- As each premium is paid, a certain amount is absorbed in expenses, and of the balance, part goes to cover the current risk, while the remainder is held as a reserve to the credit of the policyholder against the time when the claim will arise. Thus when a policy has been in force for sev. years, it begins to be of value, and if the L. is no longer required, it can be urrendered to the company for cash. Alternatively, the company may be willing to lend on the scenrity of the surrender value of the policy. It may also be possible to cease paying premiums and convert the policy into a fully paid one securing a reduced sum assured. The rates of premium quoted by any company are for normal healthy lives, and evidence of good health must be furnished by each proposer for I. At one time it was necessary in all cases to submit to medical examination by a doctor nominated by the company, but within certain limits as to company, but whom certain mine as as age and amount of policy, it is now possible to effect an I. without examination. A person may insure his own life for whatever sum he pleases, but he can insure the life of another only if he has an insurable interest therein. In all cases a proposal form has to be completed, and any fraudu-lent statement thereon would void the contract. Questions as to family hist, and previous illnesses are asked, and if the answers or the result of the medical exam-

At one time life policies contained many At one time me poncies contained many restrictions as to occupation, foreign resi-dence, or travel, but few limitations are today imposed. The main exclusion is that of suicide for a fixed period from the effecting of the 1. The period varies according to the company chosen, but it is generally about a year. It is usual, also, to exclude certain special risks, such as motor racing, flying accidents for those engaged in aviation, active service in time of war, tropical climates when the assured is at the date of the policy known to be proceeding thither, and so on. But many special huzards may be covered by the payment of an extra premium, and for some particular occupation, and climates an extra premium is olways required. Lafe I, has been recognised as an essential provision, and the premiums have been made, within limits, eligible for rebate of income tax. Although formerly the full standard rate of tax was allowed in this respect, the provision has been amended so that now relief can be clanned only at a reduced rate. This is, however, still a valuable privilege who h substantially cheapens the cost of life 1.

Cisualty and Contingency Insurance.—
This class of 1, has seen considerable developments in the past few years. It embraces a wide range of both home and foreign miscellaneous classes of 1, commonly known as accident business, which hielides porsonal accident, workinen's compensation, motor, burglary, all risks, public hability, fidelity guarantee, all classes of engineering insurances, live stock, plate glass, and others. The field thus provided for the activity of accident under-writers is a very wide one.

Personal accident L is the oldest of the above classes of L, and at one time was conined practically to the L of travellers by train, and took the form of the payment of a small sum to cover a single journey. This ensured the payment of a certain amount in the event of accident resulting in the death of the insured during that journey. The present form of accident policy takes much the same form, which is generally paid yearly or half-yearly, is adjusted to cover certain varying sums in the ovent of death or disablement, the result of accident from any cause during the year.

Personal accident I, is not a contract of indemnity. From its inception provision was made, as in life assurance, for definitely stated benefits on the happening of the event insured against, thus in many cases covering either uner or less than the actual loss to the person insured. There are three divs, of the business: (a) accidents only, (b) accidents and specified diseases, (c) accidents and all sicknoss. Rates of premium are based primarily on the occupation of the proposer. The selective achiene is one of the most attractive. This really amounts to an analysis of the benefits and relative premiums of an accident and all-sicknoss policy, it being

left to the proposor to decide, subject to certain guiding principles, which benefits and for what sums he will insure sepa nato revenue accounts have to be pub by I companies for personal accident business in this country and yearly returns must be made with regard to claims

Primanent sickness policies can also be obtained under which the assured has a contract which can at his option, be re newed during the whole of a period which migropic cent approximately his working life and under which he can continue to claim benefits whatever the duration of

entry I imployers hability or working a compen ition I is it is usually called is a direct outcome of legislation. The I-m pen if in L is it is usually called is a pair to change premiums which, direct outcome of legislation. The firm ployer Lithlits Act 1880 rendered to apply the lithlits Act 1880 rendered to the property of t with all recoulty. The Workmen's Compensation Act of 1906 which brought under the score of the Asterical ploy r of labour till further more sed the de-mand to the class of I and sev new offices of formed whilst in addition the on in companies extended their opera-tions to the accident field. Since that date see Acts Live been passed which have elded till further to the employers obligations one the Workmen's Com-pensition Act. 192 with supplementary Acts of 1940 and 144 considered. old in companies extended their eperx Acts of 1940 and 134 consolidated the law regulating compendation to workin but applied to working meany employ ment but persons ex luded from the classworkmen. The benefit for complete disablement was raised to 15 workmen's compensation policies are Workmen's compensation policies are designed to undertake on behalf of the employer his entire liability to his workmen both at common law and under statute. Promiums are based on the total wages paid by the employer, and a certain rate per cent., according to the times of provided the ments to see the first provided the control of the insured car. (5) caravan trailers. For Motor Opeles.—(1) Additional drivers, (2) pillion riding (3) passenger risk (legal liability); (4) personal accidents to insured, other specific persons, any driver of motor cycle, or sidepersons, any driver of motor cycle, or side-car passengers; (5) Continental travel; (6) employer's risk (liability to the public); (7) reliability trials; For Commercial Motor Fchicles.—(1) Loss of use; (2) pas-senger risk (legal liability); (3) spark risk; (4) goods in transit (damage by impact); (5) Continental travel; (6) em-ployer's risk (liability to the public); (7) trailers. All motor policies which include loss of ordanizate the profess risk lease. loss of, or damage to, the motor vehicle exclude wear and tear; even when mech-anical breakages are specially insured at an additional premium, any damage by wear and tear is excluded. Rates of premium for private car comprehensive policies are based mainly on horse power and partly on value, and for private motor cycles mainly on cubic capacity and partly on With regard to commercial motor value. vehicles, broadly speaking one or more of the following factors affect rates of premium for each class of vehicle : -horse power, value of vehicle, scope of cover required, locality of use, nature of use, type of vehicle, weight of vehicle and load, passenger seating capacity, and number of vehicles owned by the insured. Com-panies undertaking motor I, have to deposit £15.000 with the Supreme Court, irrespective of whether or not they carry on any other class of business. A policy of burglary I, is a contract of indemnity only, and secures the insured against the results of a crime, so that in the conduct of the business regard must be had to the criminal law of the country. Subject to any special provision in the policy, the circumstances in which a claim may arise have to be interpreted and deeded by the rules of cruninal law. Having regard to the wide range of the terms, burglary and housebreaking, many others only cover the risks of theft following actual violent or forcible entry into and upon the premises. It is obvious that in the case of valuable portable goods the rate of premium charged is considerably higher than that for more bulky and less valuable articles.

Plate-glass I., covers glass in any property against breakage through any causo, except fire, explosion, riot, and war. In these days plate glass covers all de-scriptions of glass, including plate, sheet, embossed, lettered, shop facus, signs, ornamental street-lamps and glass in shop takes to replace broken glass, instead of making a cash payment. In private making a cash payment. In private houses glass in doors and windows may be insured, the premium depending upon the rental value of the insured premises.

Fidelity guarantee enables an employer to insure against loss through the dishonosty of his employees. It is a common practice on the part of employers to require fidelity guarantee policies from any of their servants holding a position of

Gov. and Court bonds are given by I. companies. They may be said to be required whenever any person is placed in a position of trust in relation to any departis before a Court of Justice. The following are the principal classes of gov. bonds: (a) Trustees and special managers in bankruptcy; (b) Official Receivers in bank-ruptcy; (c) trustees under the Deeds of Arrangement Act, 1911; (d) liquidators under the Companies Act, 1929, engaged in the compulsory liquidation of a limited company; (e) passage brokers. Bonds are given to the Board of Inland Revenue on behalf of Collectors of Taxes and Dis-tributors of Stamps. There are many different kinds of bonds given to H.M. Customs and Excise on behalf of merchants, shippers, traders, and others to secure the revenue against loss by the improper use of articles which are subject to duty

Public Liability 1.--The earliest thirdparty policies were issued in cont. with horse-drawn vehicles, but other cisks were gradually accepted, and are now of indimited variety. In the usual form of third-party 1, the event giving rise to a claim is an accidental injury to the person or property of some stranger, alleged to be due to negligence or nuisance. owner of horse-drawn vehicles can insure against total accidents to his hye stock or damage to vehicles, or against any claims which may be made upon him by the publie through the carelessness of his drivers. 1. again-1 third-party risks is an important part of motor 1, (see above under Cascally and Contingency Insurance). The Road Tradic Act, 1930, introduced compulsory third-party L for the first time. A firm A firm may insure against claims made upon them by the public, through accidents taking place on their premises. The provision dealer may insure against claims made npon hun through ptomaine polsoning, the dentist against claims through detective work, and so on. Another class of I, has appeared as a result of the various Housing Acts dealing with the housing of the working classes. The Act of 1925 provides that houses of a rental up to \$10 in London, and elsewhere up to #26, shall be kept by the landlord in a condition reasonably fit for habitation and policies are fremed to cover this responsibility.

Under the category of Contingency I. special indemnity policies are issued in-demnifying against claims by missing hers or beneficiaries, claims under lost documents, and in respect or defects in fifle.

kugmeering I, includes electrical machinery I., Litt I., Engine I. (steam, oil and gas), and steam-boiler I. Boller I. has only recently been taken up. The policy covers damage to the boller and damage to surrounding property, or injury to persons caused through an explosion. This class surrounding property, or many to persons caused through an explosion. This class of 1., however, provides an additional benefit in the shape of a thorough ann. examination of the boiler and more fre-quent internal inspections. The business is something more than the ordinary I.,

and is consequently a class apart.
Brit. companies effect a large accident. business abroad. Of its total premiums
56 per cent comes from the U.S.A., while position of trust in relation to any depart- a further 20 per cent comes from other ment of the gov., or to any matter which places abroad, leaving 24 per cent from

this country (1938). This is a striking whose proprietary interest was mortgaged tribute to the prestige of Brit. I. houses. might, in certain cases, recover a propor-Recently there has been an increased demand for 1. against disasters due to natural causes, such as hurricanes, and during the last tew years heavy claims have been met respecting damage done by

tornadoes in America,

Agric. I. is undertaken more extensively in America, Canada, and Europe than in the Brit. Isles. In America injury by tornadoes and hurricanes to growing crops causes most damage, and a special branch of I. is effected to cover this contingency, while buil damage comes next in con-sideration. In Canada buil damage is the risk most widely covered and trost risk most widely covered, and trost damage I, is in operation in both countries. though more considerably in the U.S.A., where eighty-eight companies issue such l policies. Livestock I. forms an important |

hope to meet more than a negligible fraction of the claims that would ultimately bo made. No existing L companies would have decant of embarking on such hazardous business. The only solution lay in State action and, early in 1941, the and houses and a loss of life loss of life loss of damage by enemy action. These proposals were later embodied in the War Damage Act, 1941. [Part 1] loss owners of land, building loss of land loss of

the owners of land, buildings, and other immovable property were required to pay ann, premiums for the period 1941-45, by way of contribution towards the sums required to recomp properly owners for loss or damage by enemy action occurring be-tween Sept. 3, 1939, and Aug. 31, 1941 (further legislation was passed for subsequent risk periods). Part 11, of the Act was a gov. scheme for the insurance of private chattels against war damage and came into operation on May 1, 1911. Part I. was, but Part II. was not, com-pulsory. The amount ('contributory value') on which the premium was calculated was usually the net Schedule A assessment (before deduction of personal or special reliefs) in force Sept. 3, 1939. In general cach of the five premiums or instalments of contribution was charged at the rate of Each instalment or 2s. in the pound. ann, premium was due on July I, and was collected from the person who was the duced is below the general surface of the owner of the 'proprietary interest' on the preceding Jan. 1; and 'proprietary in ink to be applied to the paper lies in the terest' meant the freshold or any loase of recesses of varying depth on the cylinders more than seven years. A contributor or metal plates.

might, in certain cases, recover a propor-tion of his net liability for an instalment from the mortgagee.

The term 'private chartels' in the gov. scheme for insuring private chattels, covered the movable belongings of a household (furniture, clothing, valuables, etc.), and also motor cars and cycles, yachts and boats. The state allowed irro compensation for householders as follows: £200, with an extra £100 in the tor every child under 16. Every other adult person, who was not a householder, was allowed free compensation up to £50. Persons who had not insured and relied only on free compensation, might not receive more than £25 on any one article.

Over and above the limits of free compensation a person could obtain additional policies. Livestock I forms an important part of agric. I. in the United Kingdom, though it is usually undertaken in reference to pedigree stock, and is designed principally to cover animal diseases and compulsory destruction of such animals by order of the goy, in the case of foot and mouth disease.

Insurance aga of dir Raid Damage.—Early in the econd World War, associations were formed for the purpose of organizing mutual insurance schemes against damage to property by an raids. Sum, insured (whichever was the greater. No nore than \$50 or 5 per cent of the total sum covered by the policy, whichever was the greater. No nore than \$50 or 5 per cent of the total sum covered by the policy, whichever was the greater. It was soon evident, however, that no thought of the covered on any one article private association or company could Tas applied to having attacks of furming ture, expensive radiograms, and valuables.

ture, expensive radiograms, and valuables, see N. Young, Insurance, 1927; H. Loman, Insu ance Principles and Prac-leys, 1928; J. G. Sinchur, The evils of Industrial Insurance, 1932; J. G. Ander-Industrial Insurance, 1902, son, Birthplace and tieness of Life 18 yearner, 1937; A. Wilson and H. Levy, 1937; H. E.

Intaglio, strictly speaking, a gem on one surface of which a design has been holtowed out so that if this side is stamped upon some material like wax, the design is impressed and stands out in relief. Is. cmong the Assyrians and Babylonians were usually cylindrical in shape, like the chalcedony signet of Darius I. of Persia. the workmanship or which is so justly ad-mired today. The Fgyptians used to cut their scals on the flat basis of the 'scarabens' or sacred beetle—a form which is very common also in Gk. 1s. Gem-entters at first used serpentine, but as their skill mereased they preferred to work in onyx and other harder stones. Is, exist of gods, mythical heroes, instorical people, etc., the best dating usually from one of the arst three centuries B.C.

The term 1 is used to describe printing processes in which the matter to be repro-

integration, mathematical process of summation which makes it possible to had the areas enclosed by curves and the lengths of arcs, the velocities achieved by accelerations, the volumes comprised by areas, etc. From its definition as a sum mation I. may be proved to be the in verse process to differentiation. The sign

for I. is
$$\int_{0}^{\infty} Thus \frac{d}{dx} x^{2} = 2x$$
, whereas
$$\int_{0}^{\infty} 2xdx - x^{2} = See CMCLLS$$

Intellectual Co-operation, International Institute of In 1922 the League of Nations appointed a Committee which should examine international que tions on the subjects of literury scientific, and artistic work with a view to intellectual (USA) The instruction members formed the Board of Directors, which met every two months such subjects as the uni heation of scientific nomencliture, the international organisation of bibliographi cal and scientific information the development of cincin itography the extension of the laws protecting works of art and rights of artists were only a few of the ambitions schemes of the organisation. Its place is now taken by the United Nations Educational Secretic, and cultural Organisation (see UNESCO).

GISCI, MILITALY AND SECTION
Intelligence, Military, and Security
That knowledge is power is a maxim
assiduously followed by ill countries with respect to providing their nulitary leaders with the most complete information avail able regarding all other states, particu-larly those which are potential enemies Details of the military cononic and other prin resources of an enemy give valuable data upon which a plan of operations may be based. In peace, this information can be obtained in many way og the pub-statistics of a country research by persons interested in various aspects of public life or patteniar areas of the enemy's country, spies and general information contained in the Press and journals. In war the difficulty, though greatly increased, are not in-armountable spics and persons of neutral countries are employed. These can supplement information procured by air-reconnaissance by the interception and decoding of enemy wireless messages, examination of captured equipment and documents, interrogation of prisoners desertors, and escaped civilians, and reports from resistance groups in occupied ters.

Intelligence is vital to an army, but it is almost equally important to depitye the enemy of such intelligence as may be valuable to his military leaders. This is the responsibility of the Security branch, and includes consorship. If he cannot be wholly deprived of it then takes intelligence is usually smalled to him which in gence is usually supplied to him which, in certain circumstances, is more effective than letting him have no information at

Intelligence is a responsibility of the central staff at all levels. In the Birt Army the Intelligence dept of the staff is organised in two branches, A sible for collecting, collating and distrib uting information about the enemy and responsible for security. While the bulk of the information used by A' comes from the observation of its own forward troops of all arms the special requirement of b'ean only be served by special troops organised in Field Security sections which are under command of fighting formation and line of-communication commanders Both types of intelligene work are cirried out by the Intelligence Corps. This we embodied is a separate unit in July 1940 under the ultimate command of the Director of Military Intelligence. The naw and the RAL also maintain intelligence depts. RAL domination intelligence depositions of under

Interbourse Securities, stocks and shares which are of an interpational character, i.e those that are bought and sold on the London Stock Exchange, Wall Street, the

Pans Bourse, or any of the various stock former being payable on the principal exchanges of the civiliscd world. The alone, the later on the amount of the principal and interest as and when it falls due. best examples of such securities are governotes to k or shares, like 6k or Brazil bonds (but not Brit (onsols which are held almost exclusively by people in the United Kingdom), greatgev loans, Amer railway bonds, and k Indian securities. The business of negotiating the sake or purchase of 1. S is done by arbitrage dealers, whose mode of conducting operations in 1. S is to purchase or sell on one stock securities. exchange a certain quantity of seemitics and synchronously or practically synchronously to rescillor repurchase (as the case may be) on the stock exchange of another country similar stocks or shares to such an amount as from the price (ascertamble by wire) will suffice to cover not only the incidental expenses of in terest, commission, etc. but also broker age. The great benefit of this arbitrage traffic is the resulting equalisation of and stability in the prices of the great in youty of I to

Interbred Retriever, & RILLIEVER Intercalary Days, or Months, term given to months or days inserted in the cilendar between others to adjust the reckoning of the year int and in at with the solar vent. The word interculary thus means something inserted or placed between, and is used for anything interrupting a series intercostal Neuralgia, see under \$111 \tag{1}

(1) In Scots law like the L m Rom or civil law, and the minnetion (q 1) of 1 ng law, the 1 in Scots law is a decree of order of the court to restrain any act or proceedings alleged to constitute au infringement or threatened infringement of another a rights. Like injunctions for are either interim or final. An I may be granted either by the Court of Session, the should court, of the interior or burgh courts. For illustrations of the matters Course 1 of inistinguity of the material in market and in which an 1, may be obtained se under est on loans by moneylenders is prolythylotion (2) I elemantical Law hibited, not may the contract provide for eaches consume or sentence which prothe integration of 1 being 1 reased by hibited the divine services, either to parti cular persons or particular places, or both Private baptism was allowed during the time of the L, but the Holy kucharist was not, except in ordevide modes, and christian burial was demed in any consecrated place except it wise done without diving offices. These Is though frequently excepted in the Middle Ages upon whole vils., this, provide and even kingdoms have been abolished, so far as Lingland is concerned, since the Reformation. The cffect of the placing of England under an sine country and at the same time—a law I, by Pope Innocent III on March 23 which rests for its validity on the elimina 1208, in retaliation for John's expulsion—tion from profits of compensation for risk of those monks who had consented to the of dishonourable reputation, and every appointment of Stephen Langton as primate, lagraphically described by Hume See Burns Lectesiastical Law

Interest, allowance made for the use of borrowed money or capital The rate pur cent per annum is the I on 100 units for one year. I. is payable periodically, usually half-yearly in commercial transactions, but frequently monthly in the case of loans by registered money londers

cipal and interest as and when it falls due. The exaction of I. was prohibited in Engand as cally as 1197, and the prohibition pested, as elsewhere, upon religious grounds. The old usury laws fixed a maximum rate of I, varying at different times from 10 to 5 per cent, long after everyone had been convinced that the most entire freedom in commercial matters was both the right of the private individual and the benefit of the community. Benth un was the first writer who openly and system steally condemned the usury laws, and since he wrote no legislature has ven tured to do more than 'reopen an un-conscionable brigain and mother ways to regulate the stat is of money lenders by m tence on formalities of registration Lenthan like Mill, scribes the usury laws to religious bigotry, but attaches too much importance to that source \r15 totle's condemnation of usury rested on the issumption that money is in its nature hair n and that I was the productive iddition to in unproductive object, which vew beeine traditional and is quoted in Bitiits works as a popul a fallacy emong ardi t In claborate refutation of the d ami that free access to the money mikt tends to encourage projectors is also me of the most trench with successful cuttisms in the Defence of Usury all restrictions have been long since about a ned by the legislature and the rate of I ict to the discretion of lenders and bor but the courts may interfere on 108(15 equitable grounds to prevent fraud and overs whine, and loans to infants are invalid (see CONTRACT, INTEXT). I nder the Moneylenders Act, 1900 the courts m to reopen moneylending transactions of a harsh and unconsciouable nature and reduce the rate of 1 trider the Moneylenders Act, 1927 compound interest on loans by moneylenders is proreason of any default in the syment of contract may provide that if the borrower makes default whether in respect of prin ciple of interest, the mone ender shall be childed to charge simple I on the sam lue, from the date of the default until the sum is paid, at a rate not exceeding the rue payable in respect of the principal il at from any default

It is an economic commonplace that the tate of 1 is the same in all trades in the sime country and at the same time-a law tion from profits of compensation for tisk of dishonourable reputation, and every thing but pure 1 in capital. But the thing but pure 1 in capital. But the and some trades is tuiring more super intendence than others, there must always be differences in the rate of I. or profits in different trades at the same time, and in those trades or businesses in which the rate is higher than the bank rate—the criterion of the average rate—ome economists contradistinguish such higher I. is either simple or compound: the rate by the name fulls I. It is an accepted

position in economics that as wealth and pop, increase the rate of I. declines, because, among other causes, wealthy and populous communities afford less and less scope for any given quantity of labour and capital, a tendency which is the root principle of the Ricardian theory of rent; and again the increasing export of capital tends to produce a uniform rate for all countries. to produce a uniform rate for all countries, See J. Bentham, Defence of Usury, 1790; 1. Fisher, Theory of Interest, 1930; J. Meade, Itate of Interest in a Progressive State, 1933; K. Wicksell, Interest and Prices, 1936; B. W. Dempsey, Interest and Usury, 1948. See also MONEY-LENDER and USURY.

Interprepage to the product of the Product of the Progressive States and Usury, 1948.

Interference, term which in physical science indicates a phenomenon depending upon the action at one place of two sets of waves or vibrations. A familiar example which can be used to illustrate this is obtained by dropping two stones into a still pond at the same time. Circular ripples will be set up from each stone, and will eventually meet, causing disturbance. It is almost axiomatic that the greatest disturbance will occur when trough meets trough, or crest meets crest. And were the waves set up by the dropping of each stone equal in length, then when crest met trough, or vice versa, the wave motion would be entirely annihilated. It can be seen, therefore, that it becomes a funda-mental principle in the science of light, sound, and electricity in particular. In these cases, however, the waves are usually too small for I. to be detected or observed by the senses, unless there is a continual succession of the two waves, reproducing the phenomenon at the same place for a long while. Thus in light it is necessary, in order to study I, effects, to obtain the two sources from the same ray. For the great complexity of light waves, and the fact that the waves act in all directions at right angles to the direction in which they are propagated, are conditions which prevent I. effects which are visible to the raked eye being obtained from two trains of equal waves, vibrating in mutually perpendicular planes. A simple experiment, demonstrating 1, in light is, however, that known as Grimuldi's, as modified by Young. A simple ray of light, which we shall regard as homogeneous, is introduced into a darkened chamber, through two small apertures which are close together. These two divergent rays will interiere, with the result that on the screen opposite will be shown a series of bright bands separated by dark ones. The central one, which is the brightest, is placed so that all points on it are equidistant from each apertury. on it are equinistant from each apertury, and is formed by the meeting of crest with crest and trough with trough. Theoretically the cross of I. bands is composed of an indefinite number, but the fading away in brightness of those bands in practice is explained by the great difficulty of obtaining pure homogeneous light. See Sound, Newton—Newton's Kings · Soap RUBBLES: SPECTRUM; DIFFRACTION; POLARISATION OF LIGHT; and ELEC-TRICITY - Electro-magnetic Waves Maxwell's Theory.

Interferometer. Optical instrument for producing interference fringes by the superposition of two beams of light originating from the same source, and for measuring the displacements of such fringes caused by a slight increase of path difference between two beams. 1. is the most accurate instrument for the measurement of the wave-lengths of light. Michelson's and Fabry and Perot's Is, are the best known instruments. The principle of the former has been applied since 1920 to the measurement of the augular diameter of some stars that were not near enough to be resolved by the most powerful telescopes then known. Another I. is Rayleigh's which is used for measuring small differences in the refractive judices of gases. See also interfrence and spectrum and Spectroscope. See A.

Schuster, Theory of Optics, 1901.
Interim (Lat., in the meantine), namo given during the Reformation to certain attempts made in Germany to draw up a formula which would serve as a basis of agreement between Catholies and Protestants, until such time as a general council could be held. Three attempts were made to bring this about, resulting in the 'Ratisbon Interim' in 1541; the 'Augs-burg Interim' (q.c.) in 1545; and the 'Leuzzig Interim' in 1548.

Inter-Imperial Relations Report, report of a committee of Prime Munters and heads of delegations to the Imperial Con-ference, presided over by Lord Bultour, and unanimously adopted by the Imperial Conference of 1926. As regards its general principles, the report states that equality of status is the root principle governing inter-Imperial relations so far as concerned Great Britain and the dominions, which are described in the report as 'autonomous communities within the Brit. Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegance to the Crown, and freely assocuted as members of the Brit. Common-wealth of Nations.' The report points out, however, that the principle of equality and smithity appropriate to status does not universally extend to function. See further under DOMISION STATUS. See also WISIMINSTER, STATUTE OF (1931).

Interior Decoration, see under Hotse; and PANTING AND DECORATING.
Interlaken (* between the lakes '), in the

canton of Berne, Switzerland, a health canton of Berne, Switzerland, a health resort much frequented by visitors, with an elevation of about 1863 ft. It is 26 m. S.E. of Bern, between lakes Thun and Brienz, on the R. Aar. It has magnifeent mt. scenery, the Hoheweg commanding a fine view of the Jungfran. Pop. 1000.

Interlineations, in law, additions to or alterations of a written instrument made either before or after the execution of the

either before or after the execution of the instrument. As a rule, I, made after execution having the effect of altering or amending the instrument in a material particular will prevent the enforcement of any rights created under the instrument. and It is otherwise with I. made before execution, provided they were made with the consent of parties whose rights are affected by the instrument. The rule of evidence is that I on the face of 1 deed are, in the absence of evidence to the contrary, presumed to have been made prior to execution, but in a will I are presumed to have been made after the teststor signed his will I which do not affect the rights of puties who are under any hability created by the instrument are immaterial. I made in a will should always be signed and attested, as in the case of the body of the will, ard a similar precution should be observed in right of those made in a deed or other instrument.

Interlocutor, in Scots liw strictly a judgment or judicial order pronounced in the course of usual which does not finally determine the luc (of lyticized to appear to be applied to all judgments or orders of the court, whether they finally dispose of

the case or not

Interlocutory Proceedings Applications or motions before a judge in seter or dist registrir in chambers for some preliminary order decision or judgment in an ection, are called I P An order made in 1 P does not finally nose of the case but, as i rule decides sim a atterine lental to Interim injunctions (see under Injunctions) how ever although not final have the effect of final judgments if on the trial it is estab that a proper case has been made out for an injunction Application in chambers must be made by summons, or by notice of application under the summons for directions (or summons which asks the master to give due tims is to the future conduct of proceedings in such matters as discovery of documents pleadings, etc.) unless made ex parte when no such for mality is required. Applications to the court are made by motion and as a rule at least two cleu days notice of motion must be given unless the court gives leave to the contini

Interlude (I at inter between, Iulus play), a short pleet or musual pace, I or formed between the lets of a play or between the verses of a harm. In drama a short performance given between the puts of a play or in the intervals of a binquet or court puge int. The characters were as rule merely per onlined qualities such as Merey and Youth. This kind of stag production, as well as moralities and my steries succeeded the older mirale plays and in the carly put of the sixteenth century, with the comedies of Niall and the tragedies of sackvill, and Norton kept the dramatics. John Herwood (14 17-1580) wrote Is and introduced a notable characters by making the major sent types and classes of men, such as pedlars and from instead of qualities. The first performance of the new shool created by the I brakethan dramatists. John Herwood (14 17-1580) wrote Is and introduced a notable characters by making the major sent types and classes of men, such as pedlars and from instead of qualities. His print Is were lower the Present 133, 4 Meny Play between the Pardonere and the Free the Curate and Neighbur Pratte, 1533 and The Play called four P's a new and doner, Potecary, and a Padlar, 1943-17

Oil fuels are liquid mixtures of hydrocarbons (compounds of hydrogen and

carbon in various ratios) mostly obtained by fractional distillation of petroleum. The hight oils (gasoline fraction, petrol) of sp gi 0 68-0 78 have a boiling point of 40°-200° C, calorific value 19,000 B Th U 1b They may also be obtained by cracking a chemical process whereby higher boiling fractions are broken into lower boiling compounds. Bonzol is obtained by dis tillation of coul tar and consists mostly of pure benzine Heavy oils have a sp gr 0 79-1 and boiling point above 275° C Coal hydrogenation and coal and coal oil distillation also yield both light and heavy oils, and these processes are likely to be come of great importance in the future besides the calcrift value the anti-kneck' value of a fuel is a most important characteristic. When the compression ratio exceeds a certain limit the fuel detonates on ignition instead of burning with a steadily progressing flame and this

provided with inlet and exhaust valves at the top ond, the opening and closing of which are accurately timed and operated by the engine itself through the camshaft In the gas engine the mixture of gas and in is sucked into the cylinder at nearly atmospheric pre-sure during the induction, the milet valve being own, the exhaust closed. As the piston begins to rise, the inlet is also closed, the mixture being com pressed. When the piston approaches its highest position the mixture is ignited, usually by an electric spark and the ex pansic n of the combination products drives the pisten down Just before it reaches the bottom the exhaust opens and the tising piston weeps the burnt gases out (seavenging). The eyele is then repeated The evele is then repeated Some engines, especially of smaller size (1-5 h p) work on the 2 stroke principle As the piston uses on the compression stoke a fresh charge is drawn into the

N bundary (See also Most)
Only states may be parties to the I of I, but though individuals have no direct necess, a State may take up the clum of its national, and in international htigation this is a familiar kind of case As in the Permanent Court, the submission

willingness to recognise the Courts' jurisdiction as compulsory, in relation to any other State accepting the same obligation, whenever a dispute falls under certain heads, the most important being the interpretation of treaties and questions of inter-national law. Under the old Statute national law. Under the old Statute acceptances of this clause were numerous and where these are still in force they are deemed acceptances under the new Statute subject to such reservations as existed previously. But acceptance of the Optional Clause does not create a truly compulsory jurisdiction; it means merely that a State has agreed that in certain circumstances it will allow itself to be sued without the necessity for concluding a special agreement after an actual dispute has arisen. The question of a truly computsory jurisdiction for the Court remains the most controversial issue of its future (Prof. J. L. Brierly). The new Statute expressly states, what was implicit in the old, that the function of the court is to decide the disputes submitted to it in accordance with international law. Conventional language describes disputes which a court can decide as 'justiciable' and those which it cannot as 'non-justiciable,' mis-leading terminalist 'june any dispute is justiciable if the parties choose to make it so, it being for the court to decide whether or no any particular claim is well founded in law. Generally speaking it is evident that political methods of settlement will always be necessary internationally just as they are nationally, and the liveling their particular and the liveling of the liveling that the liveling of the judicial method can never replace them.

The Court itself has no means of enforcing its judgments; but all the members of the United Nations have bound themselves to comply with its judgments, and Article 94 of the Charter provides that if a party fails to obey a judgment against it the Security Council may 'make recommendations or decide upon measures to be taken to give effect to the judgment.' What sort of measures or sanctions the Council could or might put into force and what would be the precise effect of its

decision ' is left uncertain. International Date or Calendar Line, the line where the change of date occurs, is a modification of the 190th meridian, and is drawn so as to include islands of any one group on the same side of the line, or for political reasons. It is indicted by joining up the following nine points:

International Labour Organisation. The I. L. O. of the League of Nations arose out of the treaty of Versailles. One of the Irst decisions of the Peace Conference of 1919 was the formation of an Industrial Compassion under the chairmanship of Mr. Samuel Gompers, President of the Amer. Federation of Labour. Their deliberations resulted in Part XIII. of the treaty by which the I. L. O. was set up declaring the following general principles:—(1) That labour should be regarded not merely as an article of commerce: (2) The right of a-sociation by the employed as well as by the employers; (3) The payment to the employed of a wage adequate to maintain a reasonable standard of life, (4) The adoption of an eight hour day or fortyeight hour week; (5) A weekly rest of at least twenty-four hours, including Sunday where possible; (6) The about no of child-labour and the imposition of such limitations on the labour of young tersons as shall permit the continuation of their education and assure their proper physical development; (7) The principle that men and women should receive equal remuneratoo for work of equal value; (8) The stundard set by law in each country with respect to the conditions of labour should have due regard to the equitable economic to atment of all workers lawfully resident

International Institute of African Langu- | therein : (9) Each state should make pro-

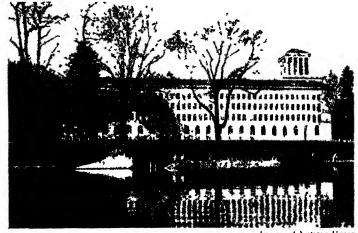

four delegates to the ann Conference, two for the gov., one for the employers, and one for the employed. These delegates are chosen by the gov., with the approval of the predominant organisation of their

respective groups.

The Conference embodies its decisions

The Conference embodies its decisions in three ways a Draft Convention, a Recommendation, or a Resolution; but succe International Law is based on the first two, they are the most important of the three. The first, the Draft Convention, resembles a treaty, and is submitted to the national authority; but it requires for ratification a two-thirds majority and

were adopted between 1919-39. sixty-three countries this teen have not ratified a single convention. Except for the ned a single convention. Except for the Soviet Union, which was a member only for a short time, these countries were of minor industrial importance, but a number of progressive countries have recorded very few ratifications. The U.S.A. have ratified only five, Cunada nine. Australia twelve, Chima thirteen, Cychoslovakla, India, and Switzerland lifteen, and so on the country, have country have attribed more than one. No country has ratified more than one half of the conventions Great Britain ind Spain leading with thirty four more revealing are the statistics showing

its adoption by the organisation A Resolution consists of a statement of general policy and is clearly of but small practical The Executive Board of Management is the governing body of the I L. O and consists of twenty four members, half being gov delegates and equal numbers of employers and workers representatives. The International Labour Office of

Geneva is the Secretariat

The twenty -ninth Session of the International Labour Conference held in Montreal (1916) discussed constitutional changes which it finally adopted, may profoundly influence the effectiveness of the L. L. O. as a working body and as a means of raising world labour standards. A draft agreement was dance in 2.3. Rations World Research with the United Nations The I L. O. in 1946 had fifty-

in any case it must be brought before the the disparity between the number of con-parliament concerned within a year from ventions voted for by goy delegates but ventions voted for by gov delegates but not patingly by the zovs. These show that the gov deligntes of Crechoslovakia have total for forty six conventions which were not afterwards ratified, those of Denmark forty-three which were not rati-fied, Brazil forty two, Canada and Norway forty, Poland thirty seven, France thirty-Sweden thirty four, and Belgium three The figure for the U.S. was tive thirty three Sixteen and for Great Britain thirteen. The obvious implications of these figures were that delegates were obtaining a reputation for a prosper-live attitude by supporting proposals which the gover they represented had no intention of putting into effect, or that they were not giving suincently serious consideration to the practical implications of the adoption of conventions. There is a considerable difference of view between labour stanrealisms. The 1 L. O. in 1745 had into-two members (as against sixty in 1940, dards in the more advanced countries and ltaly, (sermany and Japan having by them withdrawn) but at one time or another in colonial dependencies. Whether it is safty-three countries have been members sounder policy to adopt conventions and altogether sixty-seven conventions which will be of practical value in western countries but which cannot be expected to source ratification by the less advanced nations, or to adopt lower standards and hope to raise world working standards more nearly to the same level, with the concomitant risk that delegates from the advanced countries will lose interest, is not easy to say. Doubtless much would depend on the state of public opinion in the various countries at the particular moment and the extent to which that opinion can find expression. There are differences of opinion as to whether the changes proposed at the last Conference go far enough: the less practical would like to see the enforcement of conventions made compulsory for all member—an ideal which can hardly be reached before the apotheosis of national sovereignty begins to lose some of its force. But it may be reasonable to hope that in some sort they will make got, delegates consider more carefully the practical implications of their votes and help to turn the mit. of words piled up by the I. I. O. into broad and butter for workers overywhere

bread and butter for workers overywhere' (The Times, Sept. 18, 1946).
Attempts had been made by advanced teformers long 1 fore 1919 to organise labour internationary. Robert Owen was one of the first in Great Britain. Ho unsuccessfully addressed a memorial to a Conference of the Holy Alliance at Aixla-Chapelle in 1818. In 1837 Daniel Legrand, a Lothringian employer, addressed all the European Gova, similarly, Later from 1880 to 1890 Albert de Mun of France, Kopp and Winterer in Germany, Helleputte in Beignum, and Prince Lichtenstein in Austria worked to such purpose that in 1893 Pope Leo XIII, issued his famous Rerum Noranum on 'the Condition of the Working Classes.' In 1897 a great International Labour Conference was held at Zurich, and in 1900 an International Association for Labour Legislation was formed in Patis under the chairmanship of M. Millerand; associated with him was M. Albert Thomas who became the first director of the International Labour Office when it was set up in Genera. The I. L. O. pubs. many documents and periodicules, among them being: The International Labour Information (weekly): Bibliography of Industrial Hygiene; International Labour Information (weekly): Bibliography of Industrial Hygiene; International Labour Informational Labour Informational Labour Information (meekly):

International Law, comprehensive term (coined by Bentham) denoting the sun of those rules of conduct which obtain among modern civilised nations, and which regulate their mutual relations and intercourse. The 'persons' or 'parties' known to I. L. are states, and normally such sovereign independent states as are recognised members of the family of nations (on the nature of the artificial conception of state, see Government, State), or that 'aggregate of states which, as the methan of their historical antecedents, have inherited a common civilisation, and are at a similar level of moral and political opinion' (Prof. Holland). The question how far this international or rather internations and that violation of these state code of morality may appropriately

Directory.

be designated 'law' has formed the subject of an extraordinarily prolific literature. One school of jurists follows the ature. One school of jurists follows the narrow but logical Austinian analysis of law, maintaining that no rule can be a law law, maintaining that no rule can be a law positive unless set by a given sovereign to his subjects and sanctioned by force, and that international 'law,' which must not be confused with the jus gentium (q.v. and see also Equity) of the Roma. is no more than a body of principles, adherence to which on the part of individual states or nations is sanctioned by the fear of war. But another school of publicists and jurists, while not for the most part venturing ducedly to confrovert the Austinian ing duectly to controvert the Austinian analysis, asserts that laws are not neces-sarily sanctioned by force so much as by the play of public opinion, and that the want of an actual authority to enforce observance will not deprive of their legal character rules which men habitually and conscientiously obey without any thought of tear inspired by some controlling authority. The mere fact, however, than no modern civilised state would openly declare its unwillingness to be bound by such rules as have now received the seal of international approval at The Hague con-ferences, and that many have submitted to abtration with at least a show of good grace, does not alter the fact that treaties or conventions are frequently violated and on minimity gained only at the price of fear of superior armaments. In Germany, for some years before the Second World War, some vers before the second word war the tier. Gov. broke treaties without scruple, and dering the war showed that they telt bound by no 'laws' other than those of expediency. The true view would seem to be that positive or muniwould seem to be that positive or mani-cipal law and a rule of international modality have points of resemblance, but differ essentially in point of promulgation and enforcement. There is a similarity from the fact that conformity to each does to a great extent rest upon consent freely given from the recognition of an inherent and sound ethical standard. The juris-prodential aspect of I. L. is nearly sum-marised by Prof. Holland as the 'vanishmarried by Frot. Holland as the Wallistang point of jurisprudence, since it lacks any arbiter of disputed questions, save public opinion, beyond and above the disputant parties themselves, and since, in proportion as it tends to become assimilated to true large by the pergeometries of lated to true law by the aggregation of states into a larger society, it ceases to be itself, and is transmuted into the public law of a federal gov.' An ambitious but ill fated attempt to provide international rules with definite sanctions was made in the sanction clauses of the Covenant of the League of Nations (see COVENANT). The covenant provided a wider sphere of I. L. with a coercive power-net as it had not

by the civil or military authorities of any Power within the jurisdiction of which the pirate may be found. Thus the treaty endeavoured to remove from the sanctions of the laws of war the fatal defects which the First World War made so natent. Experience in the Second World War afforded no evidence of any neutral availing itself of this power. While Britain stood alone, the sole defence against the oceanwide and illegal activities of the Ger. U-boats was the Brit. Navy and its Fleet

Agencies or Sources of International Law. These according to Wheaton, are: (1) These according to vincesin, are, (1) Text writers of authority on the approved usage of nations, such as Avala (q,n.), Grotins (q,n.), Puffendorf, Bynkershoek and Vattel; (2) treaties of peace, alliance, and Vattel; (3) treaties of peace, alliance, of peace of pe and commerce: (3) ordinances of parti-cular states prescribing rules for the conduct of their commissioned cruisers and prize tribunals: (4) the adjudication of international tribunals, such as boards of arbitration and courts of prize; (5) written opinions of official jurists given confidentially to their own gove.; and (6) the hist, of the wars, negotiations, treaties of peace, and other transactions relating to the public intercourse of nations. All these sources are invoked by Wheaton as guiding the modern publicist and states-man in the search for a rule so generally recognised as to amount to a rule of I. I.. Paradoxically enough, though there was until recently next to no written I. L., there has for some considerable time existed an encyclopedic bibliography opinions on the principles underlying its now generally recognised usages. But too much importance must not be attached to the opinions of jurists, because, while some rely upon practice and precedent, or the decisions of a court and the act of a gov., others prefer the theoretical speculations of eminent, predecessors. The latter, however, are in a minority in these days of precedents, though it was otherwise in the days when the works of Grotius. Avala, and a few others were almost the sole source of information. Treaties are the most important source, if we include under that term every from of convention, contract, or declaration made between or ratified by different states. The Declara-tion of Paris, 1856, the Geneva conven-tions of 1861 and 1906, the conventions drawn up by the representatives of most of the leading nations at the various Hague peace conferences have by their combined effect led to the evolution of a tolerably comprehensive body of express I. L. purporting to regulate the usages of war, ameliorating the condition of the sick and wounded in war, whether on land (the Geneva Convention) or at sea (Hague Convention, 1899). There sources have, since the First World War, been considerably supplemented by the provisions of the Treaty of Versailles creating the League of Nations, and by various later agreements arising out of the amendment of the Articles on the Covenant. The convention of July 29, 1899; was an especially epoch-making document, for it represented the agreement of no fewer than twenty-

four states to submit certain disputes to a permanent court of arbitration, an innovation which still further assimilates I. L. to tion which still further assillmates 1.1.2. The law proper. Provision was also made for international commissions of inquiry on disputes 'arising from a difference of opinion on facts', although as to those lastmentioned bodies it was further provided that their reports should leave entire freedom of action to the parties concerned. Such an inquiry was held in the case of the Dogger Bank outrage on Brit. fishing vessels at the time of the Russo-Japanese war. In the express recognition of arbitration as the most efficacious and equitable means of composing differences, it is to be noted that, although most European powers bound themselves to submit to the arbitration tribunal for a period of five years, there is an express condition, 'qu'ils ne mettent en cause ni les intérêts vitaux, etats contractants et qu'ils ne touchent pas aux intérêts des tierces puissances. pas any interest use there's pursanters from the Covenant of the League of Nations, where it is limited by considera-tions of augression. This work of con-solidating or codifying the usages of I. L. and creating a tribunal was supplemented by the Declaration of London (q.v.), which created an International Prize Court of Appeal and further regulated the law of contraband and blockade.

The Subjects and General Principles of International Law. - The subjects or persons of I. L. are normally sovereign and independent states. Sovereignty is a fact depending on nothing else than the objective existence of all the ordinary phenomena of political independence; though such external sovereignty may require recognition by other states to enable the new sovereign state to enter the society of nations. The characteristics or elements of international personality may be sum-marised thus: Every society claiming admission to the law of nations must admission to the law of nations must satisfy the following requirements: (1) It must be represented by a gov. which receives a de facto allegiance from its sub-letts; (2) it must be a sovereign inde-pendent state, though it is not necessary that there should be complete independence (see Lord Finlay in Duff Development Co. v. Kelantan Gor. (1921), A.-C. 797; (3) it must exhibit reasonable promise of durability (internal instability was one reason for delay in the recognition of the U.S.S.R. or Soviet Russia; (4) it must possess definite ters.; and (5) it must be recognised as a member of 'the family of nations.' In the theory of I. L. a state under successive is no different from an individual state in a federal evetern, its subjects being in effect those of the suzeram state. A protectorate oc-cupies an anomalous position midway between an independent sovereign state and a state under suzerainty, for it remains independent and owes no allegiance to its protector, although a part of its rights have been surrendered either tem-

porarily or permanently.

As consequence of the First World War certain ters, ceased to be under the

mandatory representation marked a new and progressive principle in I. L. question of the sovereignty of the man-dated ter, raised juristic difficulties; for it might lie in the League of Nations, in the mandatory state, or in the mandated ter. Class 'A' mandated ters., however, ap-Cass A mandace ters, however, appeared to be largely assimilated to protected states; but 'B' (c.g. Tanganyika Territory) and 'C' (c.g. South West Africa) ters, would appear to await appropriate juristic definition. (See Jurther MANDATES; and also IRAQ; PALLSTINE; SYRIA.) Again, the self-governing dominions of the Brit. Empire occupy, in I. L., a position difficult to define. Before the First World War to define. Before the first World War they had truces of individuality or 'international personality,' in that they had their own comage, their own fug in the shape of a modified Brit, ensign, and they had the right to make treaties independently with foreign states on minor matters like tariffs. The effect of the First World War was to emphasise these previously tentative steps towards international personality; for the Dominions secured separate representation at the Peace Conterence in 1919, and comme original members of the League of Nations, with separate representation on the League Assembly; while Canada, in 1921, was given the right to accredit to the U.S.A. a representative who was to be appointed by the king on the advice of the Canadian gov., and whose duties were to deal with questions between the crown and tho U.S.A. affecting Canada. Also Erre more than ten years ago had a Minister Plenipoten-tury to represent Free State interests in Washington. Today the sev. dominions exchange representatives with a number of foreign govs. (As to the relations inter se of the members of the Brit. Commonwealth of Nations, see under Infernal (ONFERENCE); INTER-IMPERIAL RILLATIONS REPORT.)

Some encroachment on sovereignty seems to be implicit in the right of intervention. The question of peaceful intervention has been brought into prominence by the right; possessed by the League of Nations under the Covenant (q.v.) and under treaties containing Minority Clauses. Jurists do not concur on the precise scope of the right of intervention; but the ten-dency of opinion prior to 1938 was to-wards agreement on the basis of the grounds mentioned in Articles 11 and 15 (6) of the Covenant, the net effect being that the Great Powers of Europe would no longer claim under treaties the right to intervene in the affairs of other European states while there existed in the League of Nations a means to that end. But in 1938 and the immediately succeeding years, the totalitarian technique, as developed by Germany and Italy, reversed this tendency completely and not only intervention but invasion-without-ultimatum be-

tion but invision-without-untilitation became so common that the entire structure of I. L. was threatened.

League of Nations.—The League, called into boing on the ratification, in 1920, of the treaty of Versailles, and by the pro-

sovereignty of the defeated states and were mandated to various powers. The mandatory representation marked a new and progressive principle in I. L. The question of the sovereignty of the nam-dated ter, raised juristic difficulties; for it might lie in the League of Nations, in the inamedatory state, or in the mandatory state, or in the mandatod ter.

1. L. recognises the right of any state to place itself under any form of gov. it may choose, and to regulate its domestic concerns as it will. Again, a state may pursue any commercial or iscal policy and maintain what armaments it may choose without thereby infringing any rule of 1. La, and its judicial tribunals may assert exclusive authority over all persons and things within the ambit of their jurisdiction, whether such persons and things are foreign or not. But in a case of conflict of legal principles in regard to the rights of private individuals, the dictates of international commy may be said to have occasioned the habitual application of the appropriate law to each case (see Comtry). This application of foreign law is sometimes called Private I. L.; but strictly the word 'international' is inapplicable, and the rules and principles relative to the subject will not therefore be further referred to in this article.

It is also an underlying principle of I. L. that whether an independent nation be strong or weak does not affect its right to equality of treatment and respect in all matters directly or indirectly concerning its interests. Included in the ter, of a state are the so-called territorial waters extending for 3 m. out, measuring from low-water mark. It follows also from the general freedom of the high seas that monof-war and other public vessels on the high seas are 'essentially and in every point treated as though they were floating parts of their home state. Included in such to tional parts of foreign ter, are the official residences of diplomatic envoys and ambas. A movement for the recognition of tree navigation on international rivs. set in at the beginning of the ninetcenth century and developed in the case of a number of great European rivs. in conventions between the various riparian states concerned. By the supulations of the Congo Conference at Berlin in 1884-85, the Congo and the Niger are tree, and there is a special international commission called the International Congo Commission to regulate navigation on those rivs.

The detail of 1. L. relates to belligerence, or the rights and duties of states in time of war, neutrality, and the process of the pacific settlement of international disputes by arbitration. In regard to belligerency 1. L. lays down rules for the commencement of hostilities, and for determining 'enemy character,' whother of goods, ships, or persons (see ENEMY); it prescribes the permissible modes of warfare, and provides for the proper treatment of prisoners of war and wounded belligerents, though, in this connection, the policy of 'frightfulness' habitually adopted by the Gers, has involved in its application the abrogation of these rules (see also DEPORTATIONS, SUBMARINE WAR-

FARE, AERIAL WARFARE). Further, it lava down restrictions on the conversion of merchant into war vessels on the high seas, interprets the effect of conquest upon liabilities, and the general operation of treaties, and regularises the practice of pacific blockade. The rights and duties of neutral powers find expression in the rules as to contraband (see DECLARATION OF LONDON), the supply of arms by neutral states, the right of asylum, passage through neutral ter., blockade, and the visit and search of neutral merchantmen. As to what acts on the parts of its subjects a neutral gov. is bound to restrain and what ac's its subjects may do at their peril, the Alabama case showed that there was no clear principle before the award of 1907 as to whether a gov. might acquiesce in the proparation and sale of an armed vessel; the analogy to the principle upon which a gov, incurs no legal responsibility which a gov. incurs no legal responsibility for the supply of guns being very close. Now neutral govs, must use due diligence to prevent the arming or equipment of such vessels within their jurisdiction.

International Law and War Crimes.—

International Law and War Crimes.—

The critics of the Nuremberg judgment of 1946 allege that there is no precedent for establishing the crimes with which the prisoners were tried and imposing the punishment. But the crumes and atrocities committed by the Axis Powers were boyond anything in hist, in regard to both their range and their enormity. They were international in character and therefore to be judged according to the rules of I. L. The killings charged at Nuremberg were killings which the Tribunal held could not be justified under I. L., that is the laws or customs of war. The killing of the laws or customs of war. The killing of hostages, the murder of prisoners of war, the extermination of Jews and others, the slaughter of millions in concentration camps (q.v.) and in occupied countries by manifold means, were all accomplished in flat breach of the Hague and Geneva Conventions. which had been soleninly agreed by all the assembled nations, including the Axis Powers, for the ameliorisation as far as possible of the horrors of war. None of the prisoners at the Nuremberg trial received the death sentence unless he was found guilty of murder, that is on the counts of war crimes (see CRIMES, WAR) or round guilty of murder, that is on the counts of war crimes (see CRIMES, WAR) or crimes against humanity, and the modern laws and enstoms of war—the validity of which cannot be doubted for they date back to Grotius and even earlier. What was to some extent novel was that the heads of the Hitler inner Council were individually indicted and punished for initiating and waging a war of aggression. But those who aver that there is no law against aggressive war ignore the existence of I. L. Since 1919 at least the nations have deliberately sought to outlaw war. Their final pronouncement was the pact of Paris, the Kellogg-Briand Pact of 1928, a most solemn treaty made by sixty-six nations which agreed to renounce war as an instrument of national policy, and the aggressors in the Second World War were among these nations. The Pact was a declaration of I. L. by practically the

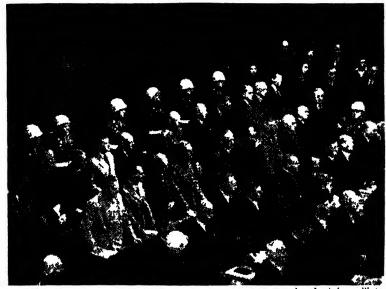

whole of the civilised nations and the Gers. were guilty of a breach of that treaty and of I. L. by initiating and waging war. Hitler and his followers were therefore individually principals in the common plan of breaking that international law and, as the Tribunal said, the crime against peace was the most atroclous crime of all; for it let loose the whole mass crimes of slaughter, terrorism, and cruelty. That was the common plan of crime which the Nuremberg Tribunal condemned and for which they punished the individuals re-sponsible. I. L. for international crines must be found in conventions or treaties like the pact of Paris, which the nations entered into in order to define the I. L. on the point. It was expressly intended to put the matter beyond controversy. The novel and arresting thing is that these declarations were at length put into use. There is thus no ground for describing the decisions of the Nuremberg trial is a post facto law. The trial is a landmark in I. L. It estab. the right of the world to inquire into the acts of military men and into the acts of govs., statesmen, and politicians charged with bringing about a war and with concerted and calculated breaches of treaty and of faith and of the laws of war. Interpleader When a person finds hunsell in the position of being sucd for the very of money or goods in his posses in in which he claims no interest but to whi h some third person besides the plain till live a clum he is not compelled either to mear the cost of defending the plain till s action or run the risk of an action it the instance of the other claimant by hunding over the property to the plaintiff. His proper course is to take out an I summons under Order LVII (rules of Supremo Court), on the hearing of which the action against him is summarily stopped and the two claimants are made parties to an 1.
1590e This is called a stakeholder's I, and is to be distinguished from a sheriff's The latter case arises when a third per son claims goods which have been solved

by a sheriff under an execution (q, v) for a judgment debt The sheriff's course is to serve an I summons on both the claimant and the executive creditor, and in the case coming on before the master, an issue will

be directed for trial, unless the amount in dispute is under £50, when he will himself summarily dispose of it. Where the master directs an issue, the claimant must of the trial; if he declines the master will make an order for sale (if goods) or payment (if money) to satisfy the judgment creditor's claim. See Cababé, Interpleader.

Interpolation, mathematical process of filling in values intermediate between those given in a set of tables, c.y. the find-ing of log 2765173 from logarithm tables which give only log 2765400 and log 2765500. In most simple cases like the example given, it is sufficiently accurate to use the method known as the method of Thus the tables give: proportional parts.

log 2765100 log 2765500 6 - 1117550 6 - 1417737 .. a difference of 100 is equivalent to 0.0000157 : a difference of 1 is equivalent to 0.0000157

.. a difference of 73 is equivalent to 0.000000157×73 = 0.0000115 to seven places

: log 2765475 - 0:44:7695

A very accurate result may sometimes be obtained from a graph by plotting out the series of tabulated values and then joining up the points by means of a curve as smooth and continuous as possible. This method is especially suitable in many physical examples where the resulting graph takes the form of a well-known curve, and also gives as good a result as we can hope to get in such cases as the estimation of the pop. of a country at some date intermediate between two centuries (see Graphical Methods of Repre-SUNTATION). As a rule, so long as the successive differences vary very slowly, a simple method is good enough, but where simple method is good enough, but where for they are generally directed to the the differences after rapidly (as for exceptioner). The party interrogating is enaughe the differences for 1' as the tangent titled to ask 'anything that can be fairly of an angle approaching 90°) another said to be material to enable non either to

Interpretation Act. Act passed in 1889 repealing and re-enacting Brougham's Act of 1850 for shortening the language used in Acts of Parliament. As to Acts passed after 1500 in the massed line words denoting the mas-culino shall include the feminine, the singular the plural, and that statutory references to the sovereign or crown in Acts of any date shall be construed to refer to the sovereign for the time being in the absence of an apparent contrary intention; and also that where any Act repeals and re-enacts with or without modifications, any provisions of a former Act, references in any other Act to the repealed provisions shall be construed as references to the re-enacted provisions. According to Webster the Brit, dominions by the I. A. of 1889 are forbidden to call themselves colonies.

Interrex (Lat. inter, between, and rex, king), official of anct. Rome, appointed by

the senators on the death of a king to hold the supreme authority in the state during an interregnum, i.e. a vacancy of the throne, or suspension of the usual gov. In anct. Rome an I, was appointed to hold office between the death of a king and the omes between the death of a king and the election of his successor. He held power for five days, and had to belong to the patician party. The first I. appointed named a successor, and sometimes the nonmatton continued to a third and even a fourth. Thus the fiction of personal selection was kept up, held to be essential to the proper transference of the religious power of king or consul.

Interrogatories. In interlocutory proecedings (q.v.) in an action at law, either plaintiff or defendant may apply, as soon a the latter has delivered his statement of defence, to a master in chambers for leave detaice, to a master in chambers for leave to administer I. to his opponent. Before being allowed to deliver I., a sum propor-tioned to the length of the I., but in no case under £5, must be paid into the security for costs account by the party delivering the I. The other party must answer the I. within ten days or such other period as may be allowed. The I. before delivery are submitted to the master, who may disallow all or any lu his discretion. Only such I. will be permitted as appear Only such I, will be permitted as appear to the master necessary for disposing fauly of the case or for saving costs. The object of L is to obtain admission- from the other party with a view to proving one's own case and to ascertain as far as possible the case of the other party. But it is not, at least in theory, permitted to a higant to institute a 'roving commission' of inquiry so as to work up a case out of his diversary's forced admissions or to defend a just cause by a similar process. iclate strictly to the matters or facts in issue (see under EVIDENCE), but, unlike pleadings, are not confined to the material facts upon which the parties intend to rely, method must be resorted to which myolves maintain his own case, or to destroy the more advanced mathematical work from the theory of finite differences.

But he cannot have the names of his opponent's witnesses, nor, indeed, is he entitled to find out on what evidence his opponent proposes to rely to prove his side of the case. used in Acts of Parliament. As to Acts stang this is expressed in the prohibition passed after 1850 the Interpretation Act of dishing? I. There are sev. forms of provides that words denoting the massobjecting to answer L. but generally objections must be by affidavit. The customary objections are on the ground of irrelevancy, that the I. are dshing, that the matter is privileged, and that the contents of a document are asked.

Inter-State Commerce Commission, see

COUNTRICK COURS. Is the name for the distance in pitch between two or more musical sounds. The smallest Is, used in practical music are semitones which, in a keyboard (but not in a string) instrument, have always the same distance in patch between them, and it is the number of tones contained in the I. between two notes of different pitch which determines the 'size' of the I. Is, are primarily divided

into two classes, consonant and dissonant, about 3 ft from the termination of the but the lines of demarcation between the illeum a small pouch (Mechel's divertitive have been very differently fixed. The culum) is occasionally found, and is probtwo nave ocen very differently fixed. The talks considered the unison, octave, fifth, and fourth more perfect than the other Is, in mcdieval treatises is were divided into perfect, medium, and imperfect the unison belonging to the first class, the fourth and fifth to the second, and the thysical the thysical the these or the second. and the third and sixth to the last div into perfect and imperfect is followed by many writers at the present day The simplest classification is one used in Ger many and is on the following system are reckoned upwards inclusively and by number of sames of notes which they contain they are in their normal state when reckoned from the first note of the major scale considered, for the time as the 'tone' Is one semitome less' than 'major' are minor' and one semitone more' than 'major' ire augmented more' than 'major are augmented while is one semitone less than 'minor See INVESTOR are 'diminished'

Intestacy denotes the decen e of a person without having inide a will, or where though a will his been mide it has been either revoked or annulled for irregularity A person so dving is said to have died in testate, and such real property as he may have died posses ed of descends ultimately to his heir in law and his personalty to the next of kin un let the statutes of distribu-tion See Succession Infrance See also Distribution, Statutes of and

INHI RITANCI

Intestina, or Entozoa name formerly given to an order composed of worms which live in the intestines of other animals it included nearly all Metazon as distinguished from Protozoa but has now no technical signification

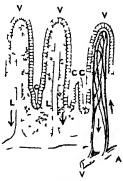

Intestines The I term the portion of the alimentary canal between the stomach

and the anus (q r)

The Small I is a shillty narrowing
tube from 22 to 2; it long and com
mences at the pylorus (n l of the stom
ach and after many convolutions tr
minates in the large I I to copies the
lower and middle part of the abdomen (qr) and is surrounded by the large I. The small I is arbitrarily divided into three portions, viz the duodenum. the about 10 in long and from 14 to 2 in in diametr, 1 the shortest and widest part of the small I it resembles a large C shaped curve its concavity on braving the bead of the innerses. It is not small in the concavity of the small in the concavity of the same of the concavity of the same of the concavity of the same of head of the pancieus It is only partly covered by the pentoncum The middle descending portion of the duodenum receives the common bile duct and pan create du f he jejunum thout 8 to 9 ft in length and 1 in in duncter oc cuples the upper and left part of the ab domen below the subcost at plane It joins the duodonal section on the left side of the vertebral column, and is continued or the verteral column, and is continued into the itum which is about 12 to 14 ft in length and 11 in in diameter. This portion occupies the lower and right part of the abdomen and is highly convoluted. Both the joinum and ileum are attached no length and 1½ in in diameter. This portion occupies the lower and right part of the abdomen and is highly convoluted Both the jejunum and fleum are attached is about i in, below that of the ileum. So far as is known, this appendix is peculiar peritoneum (the mesentery). At a point to man, certain of the higher apes, and to

ileum a small pouch (Mechel's diverti-culum) is occasionally found, and is prob-ably connected with the persistence of a part of the vitelline duct of carly fortal

Large Intestine —This portion of the alimentary canal is > to 6 ft long and ex tends from the leum to the anus It is divided into three parts viz the execum (with the vermiform appendix) the colon, and the rectum Its diameter varies from 21 in in the cocum to 11 in in the lower part of the colon diminishing gradually throughout its length with the exception

of the well marked dilatation of the rectim referred to liter the accum is a blind st occupying the right that fossa immediately behind the unterlor wall of the abdoinen and extending some 2 or 3 in, below the the accusal junction. Normally this junction contains the ileo cretal or deo cohe valve, though cases of the absence of this valve have occurred and no inconvenience has been recorded during life The excum is covered by the peri-toneum in front, below, and at the sides. From its posterior and left surface the yermiform appendix protrudes and usually the wombat; but in some animals a presence of minute closely-set protuber-peculiar formation of the distal part of the lances termed villi. Two kinds of small ceeding may represent a condition of the appendix. Its susceptibility to discase has been dealt with the execut is a cone and the appendix is its apox; it is bent appendix is its apox; it is bent appendix is its apox; upon itself to form a 6, and this form may persist throughout life. The colon is sub-divided into four parts: (a) The ascending colon, a portion of the canal about 8 in. long. It is situated in the right lumbar region and ascends vertically to the under surface of the liver. (b) The transverse colon describes a bow-shaped curve, the arch of the colon, and passes across from the right hypochondrium to the left. It is invested by the general peritoneum, which forms a separate fold for it (the transverse meso-colou). (c) The descending colon is continuous with the previous portion by a sudden bend, the splenic flexure, where is situated a remarkable fold of the peritoneum (costo-colic ligament). It dest toneum (costo-colic ligament). It des-conds vertically for about 6 in. to the left iliac fosse, and is usually empty and con-tracted, while the rest of the colon is filled with gas. The peritoneum forms a covering to it only at the front and sides. (d) The sigmoid it were is the narrowest part of the colon. Treves and T. Jonnesco have pointed out the inapplicability of the term 'sigmoid flexure,' and it is now usual to subdivide this portion into the iliac colon and the pelvic colon. The rectum, the lowest portion of the large I., extends to the anne. It belies its name in the human subject as it has a marked concavity forward corresponding to that of the sacrum and coceyx. It is some 8 in. in length and ends in a dilatation (rectal ampulla) which is in contact with the back of the prostate in the male and of the vagina in the female. The peritoneum covers only a portion of the rectum, being reflected down and forming a pouch between the bladder and the rectum in the male, or between the uterus and rectum (pouch of Douglas) in the female.

Structure and Glands of the Intestines. The I. are composed of an external serous or peritoneal coat and three others : muscular, submucous, and mucous. The muscular coat consists of two layers of fibres, a longitudinal and a thicker inner circular set. The progressive contraction of the fibres of the muscular coat produces the peristultic movement by which the contents of the L are forced onwards. The sub-inucous coat of strong loose areolar tissue is connected more firmly with the mucous coat than with the muscular coat. The mucous cost is thick and vascular and consists of: (1) An epithelial layer forming the intestinal glands; (2) a layer of retiform tissue which supports the blood vessels and lacteals, and (3) a thin layer of unstriped muscle (muscularis mucose). In the duodenum and jelmnum the mucous membrane is thrown into a series of closely placed transverse pleats (valvule conniventes). The largest are about 2½ in. long and ½ in. wide at the broadest part and they materially increase the absorbent surface to which the food is exposed. The The mucous coat is thick and vascular and ing the intestinal glands; (2) a layer of rediform tissue which supports the blood worked in the vessels and lacteals, and (3) a thin layer of unstriped muscle (muscularis mucosea). In the duodenum and jejunum the mucous membrane is thrown into a series of closely placed transverse pleats (valvule conniventes). The largest are about 21 in, long and 1 in, wide at the broadest part and they materially increase the absorbent surface to which the food is exposed. The surface to the small I. is velvety, due to the Wagner's operas also begin with an

ances termed villi. Two kinds of small secreting glands are found in the I., viz., the crypts of Lieberkühn and Brunner's glands, the latter being peculiar to the duodenum. Throughout the whole length of the intestinal tract are minute masses of lymphoid tissue (solitary glands). They are especially numerous in the current and are esperanty numerous in the carein and appendix; in the fleum they are collected into large oval patches known as agminated glands or Peyer's patches, the long axes of which, i in. to 4 in. long, are arranged length-ways in that part of the tube need district from the reconstruction. tube most distant from the mesentery

Vessels and Nerres.—All parts of the Larc supplied with a very complete system of blood and lymphatic vessels (lacteals) minutely sub-divided. The nerves of the minutely sub-divided. The nerves of the L are chiefly derived from the superior mesenteric plexus and at first they and their subdivs, cling very closely to the larger arterial vessles; finally they reach the 1, in very numerous branches to be distributed and redistributed in the muscular and sub-mmous coats. See R. Smith, Acute Intestinal Obstruction, 1948.

Intimidation, see THREATS.

Intonation, in music, the opening phrase of any plain-song melody. The term is usually applied to the first two or three notes of a Gregorian psalin-tone, generally sung by one or more selected choristers, or by the officiating priest. Its use is, as a rule, confined to the first verse of the pulin or canticle, though occasionally in the Vagnificat, Benedictus, and Venite the opening phrase of each successive verse is sung in this way to give a greater solem-

Intoning, custom of rendering prayers in the form of a musical recitative, similar to chanting, the greater part of the prayer being recited on one note. It can, however, be varied by the introduction of cerever, be varied by the introduction of certain simple inflections. In eathedrals and larger churches, I greatly simplifies audible utterance. The practice of 1, is undoubtedly of anct. date, and obtains among the great imajority of oarbarous nations, as well as in the Us., Rom., Anglican, and Lutheran churches.

Como. There are ironworks, and manufs.

of silk, cotton, and felt. Pop. 7000.
Introduction (It. ultraductione), musical term signifying the preliminary to a following movement. Strictly speaking, it s the piece of music with which an opera opens, and is preceded by the overture, but many composers make it take a more

introduction, and a short one is often prefaced to the second and third acts as well.

Introit, part of a psalm, with antiphon and gloria sung in the Rom. Catholic Church at the beginning of the Mass, as soon as the priest begins the introductory prayers. Other passages of Scripture are sometimes used. The introduction of Is, is ascribed to either Celestine (123) or to Gregory the Great (590). Some of the Is. in the present missal are taken from un-inspired writers.

Intromission, in Scots law, the assuming possession of the property of another either on legal grounds or without authority. I. I. the latter case is contradis-tinguished as vicious. One of the com-monest forms of legal I. is that of an adjudger, or creditor, who has obtained an adjudication by process of diligence against his debtor for the payment out of the rents of his debt and interest. See hell's Comment.

Intrusive Dyke Rocks, see under Ignitotis

ROCKS.

Intuition, in philosophy, a term signifying the mental faculty of spontaneous knowledge of the truth as opposed to its discovery by any ratiocinative process. The concept and word are taken from the terninology of medieval scholasticism. In particular, I. in scholastic theology meant a knowledge of God in the beatific vision. The term 'intuitional,' as used later in the science of othics, is of the first importance in that it denotes a school of thought diametrically opposed to the utilitarian. The intuitionists define the principles and method upon which are to be determined right rules of conduct by reference to a supposed moral sense, or, in other words, duty is to be measured by certain fundamental axioms or intuitively known principles of moral reasoning. The utilitarians, on the other hand, adopt no such subjective standard of good conduct, but estimate the moral value of an act by reference to an objective standard of reference to an objective standard of human duties, whether utility, general happiness (universalistic hedonism), or individual happiness (egoistic hedonism). The authority of the conscence or moral sense as opposed to what may generically be termed the social affections was first advanced, among Eng. philosophers, in a distinct form by Butler in his Dissertation on Virtue, 1739, and carried further by Reid in the Essays on the Active Powers of the Human Mind, 1788. Reid insists on the essential difference between self-love. or regard for one's own good, and sense of duty, or conscience, where Butler seems to have leaned to a belief in their identity in a future life. Whewell in Elements of Morality, 1815 endeavours to formulate a list of intuitive principles exclusive of all regard for happiness and referable to the sole governing principle of conduct, the moral reason. These Is. are compendlously defined as the principles of benevo-lence, justice and truth, purity and order. The introduction into the system of the term 'reasou,' which, as we have seen, is directly antithetical to the primary notion directly antithetical to the primary notion inight, that the lives and property of the of I., connotes merely the supremacy of inhabs, being necessarily at the disposal of reason over purely non-rational impulses the occupant, the inhabs, acknowledged his

or instincts (q.v.) Kant's use of the word Anschauung (literally 'beholding') is Anschauung (literally beholding) is practically equivalent to perception, and he gives as instances of true forms of beholding, time and space. But, regarded subjectively, Kant names such Is. trans-cendental (unknowable), though objectively they are empirically knowable. See A. J. Balfour, Defence of Philosophic doubt, 1920; N. O. Lossky, I. intuition, ta matière et la vie, 1928; K. W. Wild, Intuition, 1938.

Inundations, see FLOODS AND INUNDA-

TIONS.

Intussusception, or Invagination, condition in which one part of the intestine passes into the adjoining portion, tele-scopically, just as the fluger of a glove may on taking it off the hand. The contained portion is nipped and strangled, with the result that all the dangers of hernia (q.v.), but in a much more acute form, are preeent. It is a frequently fatal cause of obstruction of the bowels in children, but is not very common in adults. Surgical treatment is usually imperative. In the early stages a copious enema of oil may restore the normal condition, but the use of purgatives can only make the condition WOrse.

starch-like Inulin $(O_{72}H_{121}O_2)$ stance which is found in dahlia and like tubers, where it forms a reserve food supply. It is coloured yellow by iodine, and is quantitively hydrolysed to the sugar fractose by dilute acids.

Invar, steel alloy, containing 35 per cent of makel and some manganese. Used for

or maker and some manganess. Used for measuring rods and pendulum bars. Invasion. In the theories of the rights conferred by international law (q.t.) on myaders it is necessary to distinguish be-tween military occupation and conquest. Occupation may imply no more than the placing of ter, under the authority of a hostile army by way, as it has been ex-pressed, of sequestration, without any intention of appropriating it. Conquest on the other hand, means acquistion. the such distinction was drawn until the middle of the eighteenth century, with the result that the inhabs, of a ter, in the possession of a foreign army were bound not only to swear allegiance to the invader. but to assist him in all respects as if he were the legitimate sovereign. After the After the Seven Years war juristical writings, notably those of Vattel, began to advance the doctrine that a sovereign does not lose his territorial rights in war until a formal cession at the close of the war by treaty. The prevalent modern theory appears to be that the occupying army merely takes temporary possession for certain purposes, while the sovereignty of the original owner continues for all other purposes. But until recently the practice of belligeren govs. duffered from the theory which presupposes that since the invader is invested with no more than a substituted or quasisovereignty, the national character of the people and soil remain unchanged. The practice is a corollary of the mere rule of sovereignty in consideration of his forgoing the extreme rights vouchsafed by superior force. The question of what acts an occupying army may legitimately do depends on circumstances. The general principle is that everything is prohibited which is not calculated to contribute to success in the military operation con-

cerned.

The articles of the Declaration Brussels prohibit (1) any compulsion of the pop, of occupied ter, to furnish information about the army of the other belliproperty, but without prejudice to the property, but without prejudice to the property, but without prejudice to the right to confiscate by way of punishment or under stress of military necessity; and (4) pillage: and enion (a) the respect of family honours and rights, individual lives and private property, together with religious convictions and liberty, and (b) the general duty of taking all steps to rethe general duty of taking all steps to restab, and ensure, as far as possible, public order and safety, while respecting, unless absolutely prevented, the laws in force in the country (for full information on these points, see Lord Birkenhead's Italy The rights of conquest are, of course, and h wider. Birkenhead defines conquest as the normanent. head defines conquest as the permanent absorption of all or part of the ter, of a defeated enemy, but lays it down that a title by conquest is only complete if the conqueror has the material strength to make his conquest good and has exhibited the intention of appropriation. The effect of the Nuremberg Trial, which followed the Second World War is to give a new juristic conception of I, when all the circumstances estab. that it constitutes the initiating and waging a war of aggression. If this be proved, the invader has no rights at all in international law but, on the contrary, both individuals and bodies responsible for launching such an I. may be tried on the capital charge. See CRIMES, WAR; INTERNATIONAL LAW— International Law and War Crimes; NUREMBERG TRIAL.

Invention, see Patents.
Inventions Board, see under Fisher or KILVERSTONE.

Inventory and Inventory Duty. in regard to the administration of the estates of deceased persons is a list or schedule in which are enumerated all the articles comprising the personal property of the deceased. It also denotes a de-tailed descriptive list of the assets of a bankrupt, and the property comprised in the schedule to a bill of sale on personal effects. The duty of making an I. of a doceased's effects falls upon the executor doceased's effects tails upon the executor (rep. 1500), or administrator, who should make it in Inverkeithing, part, and municipal bor, the presence of at least two of the ereditors of Scotland in Fife co., on the firth of of the deceased or next of kin, or any two forth, 10 m. from Edinburgh. It forms credible persons, and it should describe one of the Dunferuline dist, part, bors, the articles seriatin, with the value at which each has been appraised, especially yard, and there are mills, tanneries, and brickweeks. Pop. 3100. as it may afterwards be admitted as evidence to show what is due to the beneevidence to show what is due to the bene-ficiaries or creditors. But to be admiss-ble as evidence it should on completion be signed and sworn before a commissioner defeat of Arryll by Montroso in 1645.

for oaths. It may be noted that any person interested in the estate may call upon the executor or administrator to exhibit an I., and to render an account of his administration. In Scots law the term I., besides the above applications, is used to denote the schedule made by an heir of the heritable estate of his ancestor with the object of limiting his liability for his ancestor's debts to the amount of the value of the estate so inventoried.

Ionian School of Philosophy, which ft. during the sixth and lifth centuries B.c. was chiefly interested in the primordial constitutive principle of the universe. The first of them was Thales, his chief suc-cossors being Amerimander and Anaxi-The earlier philosophers sought menes. to explain the material universe in terms of matter and force, finding material substance in everything that exists. About the time of Herachtus a new thought sprang up. Anaxagoras asserted that everything existed from the beginning in an infinite number of infinitesimal atoms which were the seeds of all things which have since been produced. Diogenes of Apollonia claborated on the universal homogeneity of nature, the universal substance of all things being air. The later Ionians, Archelaus and Hippo, reverted to the earlier thought of Thules.

lowa, N.-central state of the U.S.A., popularly known as the 'Hawkeye State,' covering an area of 56,280 sq. m., 55,986 being land surface. Bounded on the N. by Minnesota; on the S. by Missouri; on the E. by Wisconsin and Illinois; and on the E. by Wisconsin and Illinois; and on the W. by Nebraska and S. Dakota. The surface is undulating, nearly four-fifths comprising rich prairies, forming good pasturage. The soil is generally fertile, the chief crops being Indian our, hay, oats, wheat, barley, and potators i linsed and sorghum are of importance commerall sub-chalts. Among the fruits are apples, About charters, grapes, plums, and strawberries; hought bectroot is cultarated for sugar. The d that state is the richest in arable land in the Umon, and about one-eighth is composed of natural forest—oak, walnut, hickory, pine, cedur, elin, maple, and cotton-wood. In the E. portion of the state minerals abound, including coal, lead, zinc, iron, lancstone, gypsum, clay, sandstone, and gravel. The leading industry is meatpacking; while dary produce, including butter, cheese, and condensed milk, is of great value. Flour-milling and the manuf. or farm implements are important, and wool is a valuable commodity. All the toys, are direct or indirect tribs, of the tonic Dialect, was one of the four tost, are direct or indirect tribs, of the varieties of (4k, language, It was printy Missouri or Missispin, but only a few are cipally spoken in the Ionian colonies of mavigable; there are sev, small lakes in Asia Minor, but was not uncommon in the state. The climate is one of great exsome of the is, of the legean Sea. Out of tremes of heat and cold, generally with a the old Ionic arose the language of epic dry winter and a wet summer. There are poetry. Herodotty distinguished four no very great cities. The negro popy varieties of the New Ionic, in one of which torms a very small percentage and the

foreign-born peoples are mainly of Ger. or 1 Scandinavian origin. Iowa was formerly populated by Indians, but in 1788 the Fr. came to Dubuque to work the lead mines there; they later claimed the state, which was purchased in 1803, settled by a white pop. in 1832, and organised as Iowa Ter. in 1838. It was admitted to the Union as a state in 1846. It is divided into ninety-nine cos., and the cap. is Des Moines, 159,800, other important tas. are: Sioux 159,800, other important this, are: Sloux City, 83,000; Davenport, 66,000; Cedar Rapids, 62,000; Waterloo, 52,000; Dubuque, 41,000; Council Bluffs, 42,000; Ottumwa, 32,000; Mason City, 27,000; Clinton, 27,000; Burlington, 26,000; Fort 1/odge, 23,000; Marshaltown, 20,000. The pop. in 1940 was 2,538,266 (negro 16,694). The Governor and the object of these are above for a town of the chief officers are chosen for a term of two years; legislature consists of a Senate and a House of Representatives. I. sends 2 senators and 8 representatives to Congress. senators and 8 representatives to congress. The College of Agriculture at Ames is the finest of its kind in the U.S. It has over 5000 students. There are over 9800 m. of railway line. See J. Brigham, lova, 1915; I. B. Richman, loway to lowa, 1931; Federal Writer's Project, lova: 1 Assistant the Humber State. 1938; C. Cole. Truide to the Haukeye State, 1935; C. Cole, Iowa Through the Years, 1910; W. J. Petersen, A Reference Guide to Iowa His*tory*, 1912.

Joya City, cap. of Johnson co., Iowa, U.S.A., on the Iowa R., 23 m. from Cedar Rapids. It is the seat of the Iowa State Univ. It has foundries and machine shops. It is a rich farming and stock-breeding dist. Pop. 15,000.

lowa River, rises in Hancock co. in the state of Iowa, and flows in a S.E. direction entering the Mississippi in Louisa co. It is navigable to Iowa City and is about

350 m. in length.

Iowa, State University of, co-educational institution founded in 1817, but not opened until 1855, when the gov. moved from Iowa City, and the old cantol became the Univ. headquarters. Many new buildings were added; the lowe R. flowing at the foot of the campus provides aquatic sports for the students. There are about 6000 students, and the teaching staff is over 500.

Ipecacuanha, emetic substance obtained from the roots of sev. S. Amer. plants. The true I. is a species of Rubiacese known by the various generic names of Cepharlis, Psychotria, and Urogoga, and occurs in damp forests of Brazil. It is a small herbaccous plant with a prostrate stem and an annulated root. In incdicine it acts as an emetic and stomachic, aids respiration, and increases perspiration.
The white I. is a violaceous plant, known botanically as fondium lipeacuanha; the basteri I. is a species of Asclepia-dacear bearing the name Asclepias curassavice. The active principle of true I. is an alkaloid known as emetine, now used in the treatment of anneline discentery. Dover's powder is I. and opium.

Juno sent two serpents to kill Hercules, who strangled them. (2) Was a son of Phylacus and Olymene, whose cattle were famous for their size.

Iphicrates (c. 420-318 B.C.), celebrated Athenian general, the son of a shoemaker. He changed the dress and arms of the Athenian soldiers, and introduced the pellaste (a maragra), or targeteers. These light troops were originally com-posed of Thracian mercenaries. He posed of Thracian mercenaries. Ho fought in the Corinthian War, and defeated the Spartaus in 392. After 371 he assisted his futher-in-law, Cotys, king of Thrace, in war against Athens, but was subsequently pardoned, and took joint command of the Social War.

Iphigenia, according to Gk. tradition, the daughter of Agammemnon and Clythe daughter of Agamemuon had provoked the goddess Artemis (Dana) by killing her favourite hart. When the Gis, were going to the Trojan war Attemis produced a calm, so that the ficet in Aulis was de-tained from sailing. The soothsayer Calchas advised Agamemnon to sacrifice I. in order to appease the goddess, and Agamemnon ultimately consented. cording to one legend she died on the altar; but, according to another. Artems put a hart or a goat in her place at the last moment, and carried her off to Tauris. There I, became priestess in the temple of Artems, and saved her brother Orestes with his friend Pylades from being sacri-field to the goddess by fleeing with them to Greece, carrying away the statue of Artenus from the temple. I. was worshipped in Athens and in Sparta, and it is probable that she was really the goddess under another name. See A. Verrall in Europedes the Rationalist, 1899: F. Ernst, Iphygenia and Andere Essays, 1933.

Ipomea, genus of Convolvularce, consists of about 400 species of herbaceous and shrubby plants growing wild in warm and tropical countries; many are cultivated in milder climates for their showy flowers. I. Balalas is the sweet potato; I. purpurea, the morning-glory; I. pur-ga, the jalap; I. pandurala, the wild

potatovine.

Ipsambul, or Abu-Simbel, ruins in Nubia, Upper Egypt, on the R. Nile. There are two rock temples, which were built by Ramesos the Great, in the sides of steep cliffs. They contain numerous statues and sculptures. See Ecypter statues and sculptures. See EGYPT.

Ipsus, in anct, geography, was a tn. of Phrygia, in Asia Minor, where in 301 B.c., Antigonus was defeated and killed.

Ipswich, municipal, co., and parl, bor, and the co. tn. of Suffolk, England, at the head of the Orwell estuary, 69 m. N. E. of London. I. was once a tn. of narrow anct. streets, jettled lath-and-plaster buildings, and storied inns; but is now a tn. of other parks of the control of the contr tn. of old and new, where Elizabethan oak mingles with fabrications in steel and conan alkaloid known as emetine, now used in the treatment of another dysentery.

Dover's powder' is I. and opium.

Ipsk (Pekia, Peč, or Petch), see Pec.

Iphieles: (1) Son of Amphitryon and Alemene, and twin brother of Hercules.

While the two bables were in a cradle, throughout, with fine oak-panelled rooms and richly decorated cellings; Christ-church Mansion, built between 1548-50 by Edmond Withipoll, with extensive rebuilding in the seventeenth and eighteenth centuries; it is now maintained by the Corporation as a muscum of domestic antiquities, period furniture, and pictures, respectively. Fair, Chicago, Other well-known I, inns some by Gainshorough and Constable: are: the Crown and Anchor' of compress-Corporation as a museum of domestic antiquities, period furniture, and pictures, some by Gainsborough and Constable; Wolsey's Gateway (1528) in College Street, the only fragment remaining of Wolsey's ambitious plan to found a college in I. as a nursery for his Cardinal College at Oxford, with the aid of revenues de-rived from the suppression of monasteries; in 1530 work on his great College of St. Mary came to an abrupt end and the buildings were razed to the ground. The centre of the tn. and of its communal life is the Cornhill. Here are the tn. hall, general post other, and the banks. The tn. hall occupies the site of the old Moot Hall and the general post office that of the Shambles or but bers' mart. The Moot Hall was a ramshackle building with an outside stairway to the upper storey and with the stocks in front and the Market Cross on its right. Some of the streets leading into the Cornhill are narrow, but others have been leved. The main lened. The main thoroughtare comes into the Cornhill and out again and runs by White Horse Hotel. Many of the finest slops are in the Butter Market near the tn. hall. In High Street to the N. is the Corporation Museum which originated in a museum opened (1817) by a society founded for the encouragement of the study of natural last, amongst the working classes. It now includes depts. of general and local natural hist., archaeology, and ethnology.

There are sev. ine churches, mostly Perpendicular in style: St. Margaret's, built in the early inteenth century with supple stone and fint panelled S. porch, embattled clerestory, and oak Tudor hanmer beam roof; St. Peter's, near the site of Wolsey's Ill-lated college, in Decorated style; Ilke St. Margaret's this church suffered much from the reonoclast. Will low-ing; both also suffered exterior damage from air raids; considerable renovation and extension were carried out renovation and extension were carried out in St. Peter's in 1878 under Sir Gilbert Scott; St. Nicholas, with a fourteenth-century nave and aisles of particular interest architecturally. Other churches are St. Mary-le-Tower, the Corporation church in the churchyard of which King John's charter was received in 1199 by the John's charter was reversed in 1950 by the balliffs and burgesse; the church was almost entirely rebuilt in 1860-70 and all that remains of the sixteenth-century structure is the nave piers and arches: St. Mary-at-the-Quay, built or rebuilt about the middle of the fifteenth century;

are: the 'Crown and Anchor' of compara-tively recent date; the 'Coach and Horses' first built as a private residence and only first built as a private residence the cen-becoming an inn in the eighteenth century; the sixteenth-century 'Black Hore'; the Golden Lion in Cornhill; the 'Old Bell,' 'Half Moon,' 'Golden Flecce '-in the yard of which bull-baiting was a popular pastime, and the 'Neptune,' nl-o once a private residence and noted for its carved ceilings and oak-panelled resurved collings and oak-panelled rooms. The first public library of I. was built in 1887. The present Central Library in Northgate Street was built in 1921. It is a noted depository for Suffolk records and has a growing collection of these original converses of social bit. There these original sources of social hist. There are also four branch libraries. There are 9 secondary schools situated in the various dists, of the in., 4 each for boys and girls and the Northgute Grammar Schools, For further education there is a school of technology, the School of Arts and Crafts, the school of Commerce, and Christchurch Exeming College. I. School, which has a continuous hist, from 1477 or even earlier, now ranks as an independent public chool Formerly estab in Blackfrian monastic precincts and elsewhere, the chool moved to its present site in 1851; the foundation stone was hid by the Prince Consort. The general hospitals of I. are the E. Suffolk and I. Hospital and the Bor. General Hospital. 1. has six public parks in addition to many recrea-tion grounds (182 ac.): Christchurch Park and arboretums, a richly wooded park of 70 ac., purchased by the Corporation in 1891, and containing the Christchurch Mansion Museum; Chantry Park and Mansion (124 ac.) presented in 1927 by Sir Arthur Churchman, Bart. (Lord Woodbridge) and opened by Princess Mary in 1925; Bourne Park (76 ac.) also presented in 1927 and opened by Prince Henry (Duke of Gloucester); (Apreswyk Park (15 ac.) opened in 1910; Holy Wells Park and Mansion (61 ac.) also given by Lord Woodbridge and opened in 1936; and Mexandra Park (11 ac.) opened in 1904.
Industries.—The industries of I. in-

clude large engineering and agric, impleclude large engineering and agric, impre-ment works (especially ploughs, tractors, harrows, threshing machines, and lawn-mowers); tobacco: fortdisers; yeast; clothing; artificial sile underwear; boot and shoo manufs: railway plant; and shoe manufs.; railway plant; tanneries; printing works; breweries; railway and flour mills. Among the industrial products are; electrical products—motors and dynamos; industrial products by my constitution of the constraints. about the middle of the fifteenth century; this church, too, was severely damaged by bombs; St. Lawrence, a lefty church in the Perpendicular style built of finit and brick with an embattled tower and 5 medieval bells. Of the L inus which, though they have undergone many architectural changes, have yet stood beneath their same signs for over 4 centuries, the most famous is the "Great White Horse." the transmission on the same site factory plant; steel-framed buildings;

heating radiators and bollers: malicable | 2 members to Parliament, until 1918 when iron and gunmetal fittings and gunmetal | the number was reduced to one. In 1518 and cast iron valves for the heating, oil and sanitary engineering trades: brass and copper base alloys; metallurgical plant for the manuf. of bearings, etc.; cigarettes; letterpress and lithographic printing and stationery; sawing and planing machines; plywood, wall boards and plastics; domestic engineering articles; refrigerating plant; sacks, bags and tarpaulins; garden seats and other garden furniture.

Dock and airport.—Vessels drawing 19 ft. can enter the dock (area 26 ac.) at I. and ships up to 7000 tons can berth at Chir Quay. Following on the passing of the first I. Dock Act, 1837, work on a new dock began in 1839 and, by 1813 I. had the largest wet dock in Great Britain. 1852 the dock commissioners became a corporate body with much increased powers. In 1881 a larger entrance lock was opened and in 1904, 800 ft. of new quay was built. In 1923-2; came a new deep water quay (1800 ft.) on the E. side of the Orwell. The docks and quays are equipped with modern electric cranes and all rail facilities. The airport (opened in 1930) of I. on the E. outskirts of the tn. is one of the flust municipal airports in

the country.

 Anct. relies indicate that I History. was the site of a Brit. settlement 2000 years ago or before the Rom. occupation. Throughout the Saxon period, I. or Gyppeswyk as it is called in the Anglo-Saxon Chronicle, began a steady develop-ment which at length attracted the attention of Dan, marauders. The Danes were defeated at sea off the mouth of the Orwell in 880 by King Alfred; but in 991 and 1000 they invaded and set tire to the tn. and levied a fine of £10,000 upon the inhabs. But these raids do not appear inhabs. But these raids do not appear to have had any lasting effect on the tn., whose port rapidly outgrew those of the rival townships on the E. coast. At the time of the Domesdav Survey I. had as many as 9 churches. In 1199 I. received its first charter, granted by King John (see above) which gave to the inhabs. liberties and privileges they had never previously enjoyed and exempted them from many taxes. By 1280 the traffic through the port was of sufficient vol. to justify the appointment of a collector of justify the appointment of a collector of plastify the appointment of a contector customs. I. was in fact a flourishing port when Hull was still an insignificant vil., and Liverpool merely a swamp. It was at I. that Robert de Beaumont, earl of Leicester, landed with a force of Flemish mercenaries to attack the King's armice near Bury St. Edmunds in 1173. In 1338, the tn. sent 12 ships, in addition to men and supplies, to join the carl of Leicester's fleet before the Battle of Sluys. It was to Edward III. that the tn. owed the introduction of an industry that brought it new prosperity; for he brought over to England 70 families of Walloons, who were weavers and wool-workers, and the woollen industry grow rapidly in Suffolk generally. In 1146 occurred the election of the tn.'s first representatives in Parlialen industry grow rapidly in Suffolk generally. In 146 occurred the election of the tn.'s first representatives in Parliament; from 1446 I. continued to send the Maranon, a branch of the Upper

Henry VIII. granted to the corporation jurisdiction over the Orwell estuary as fur as what is now the port of Harwich. The course of the seventeenth century saw the migration of the woollen industry northward and westward, and by 1650 the trade of I. had declined by one third, but as a set-off the tn. had begun to participate in the profitable coal importing trade be-tween Newcastle and London. More skilled foreign artisans came to I. in the reign of Charles during the religious persecutions of the Huguenots. Shipbuilding became a major industry of the port in the seventeenth century and many E. Indiamen, as well as warships, were launched from its yards. It was still being carried on as late as the middle of the nineteenth century. But the size of the ocean-going ships increased beyond the capacity of the I. yards, so that the in-dustry declined and ultimately disa-appeared. Among the formous names associated with I. that of Wolsey (b. in St. Nicholas Street 1171) is pre-eminent.
Horatio, Lord Nelson, was High Steward
of the bor, from 1800 to 1805. Adm.
Lord Vernon was the tn.'s parl, representative in 1741, 1717, and 1754. Viscount Kitchener of Khartoum and of
Aspall (suffolk) was High Steward, 1909—
16. Thomas, Laushopowerb, and John 16. Thomas Gainsborough and Constable both spent part of their lives in I. Francis Bacon was sev. times member of Parliament for I. Yet other names of Parliament for I. Yet other names are those of Sir Christopher Hatton, after whom Hatton Court is named; Thomas Clarkson, after whom is named Clarkson Street; Thomas Cavendish, the navigator, after whom Cavendish Street is named; David Garrick, who began histage career in I., Jean Ingelow, Rider Haggard, Bernard Barton, the Suffolk poet, and the Rev. Richard Cobbold, author of The History of Margaret Calchpole, 1845. Pop. (estimated, 1917) 101,000. 101,000.

Iquique, city and scaport in Chile, cap. of the prov. of Tarapaca, 820 m. N. of Valparaiso, on the Pacific coast. Owes its commercial importance chiefly to the export of nitrate of soda and borax. Until 1830, when the export of nitrate began, a company a proper of the company I. was only a small fishing vil. of little importance. It is now connected by rail importance. with the inland tn. of Tarapaca and various mining centres and is well pro-vided with trainways, electric light, tele-phones, etc. It was founded in the sixteenth century, upon a peninsula between the Colorado and Cavancha headlands. Twice, in 1868 and 1875, the tn. was nearly destroyed by an carthquake and tidal wave, and in the war between Chile and Pern it was ceded to the former by treaty in 1883. Water is brought to the city from Pica, 60 m. away, a vil. settled by Sp. soldiers in the sixteenth century. Large deposits of guano are found on the coast. The climate is rainless. Pop.

Amazon, 2300 m. from the mouth, and 1268 from Lima. It is a Peruvian flotilla naval base. There is a wireless station and a regular air service. Pop estimated at 20,000.

lquitos, tribe of S. American aborigines, in the region between Peru and Ecuador,

on the N. part of the Upper Amazon. Irak-Ajemi, central prov. of Persia, almost corresponding to the anet. Media. Its surface consists very largely of elevated table-lands, but there are numerous fertile valleys, rich in cereals and fruits, but only partially cultivated. The E. part is occupied by the great salt desert of Dasht-i-Kavir, or Khorassan. 1. com-prises the modern dists, of Kurdistan, Ardelan, Luristan, Ispahan, and Kashan. The prov. contains the prin. ths. of Persia, including Teheran, the cap., and Ispahan. The industries consist in the weaving of carpets, most of which are exported to Europe, and the manuf, of glass and porcelain. Area, 138,190 sq. m. Pop. (estimated) 3,000,000.

Iran, or Eran, originally the name of the great plateau bounded on the N. by the Caspian Sea and Turanian Desert, on the S. by the Persian Gulf and Indian Ocean, on the E. by the line and on the W. by Kurdistan and the Tigris. The name, which is now the official designation of the Persian kingdom, is derived from Aryana, 'the country of the Aryans.' Strabo declared that the name and language extended to the Persians, Medes, Sogdians, and Bactrians, as well as to the inhabs. of the S.E. of I. See Persett.

Irapuato, tn. of Mexico in the state of Guanajuato. It is an important railway junction, and is situated on the rulway between Mexico and Guadalajara. Pop. 29,700.

Iraq (Mesopotamia, 'the land between the rivers '). A kingdom in the Middle E., extending from Kurdistan on the N. and N.E. to the Persan Gulf on the S. and S.E., and from Persia on the E. to Syria and the Arabian Desert on the W., the position being between 374° and 484° E. long., and from 374° to 30° N. lat. The country has an area of 160,600 sq. m. and includes the former Turkish vilayets of Mosul, Bagdad, and Basta.

Mosul, Bagdad, and Basta.
The pop. according to the census of 1945 was 4,611,350. The pop. of the chef liwas is: Bagdad, 1,009,098; Mosul, 553,188; Basra, 400,078; Diwanich, 331,909; Muntafig, 281,617, Arbil, 273,197; Diyala, 269,752; Hilla, 263,837; Kirklek, 262, 209; Amara, 183,944; Kut, 180,145; Sukemani, 175,812; Dulain, 157,616, and Karbala 175,812; 140,356. Dulaim, 157,616, and Karbala, Of a total pop. of 3,560,500 in cto wore 313,600 Moslems; Phristians; 90,900 Jews; and 1935, there were 101,300 Christians; there were 41,100 of other religious.

Physical Features.—I. may be divided into three main divs.: the Plain, the Uplands, and the Highlands. The Plain consists of the delta of the Turis and Euphrates, and extends roughly from the Persian Guif to a line joining Falujah with Khanaqin. The soil is alluvial, and there is no stone. The rivs. run along ground a few ft. higher than the rest of the Plain, Sulalmaniyah and Ranla.

which is consequently liable to be flooded when the rive, are high. This happens each spring when the snows in Kurdistan and Armenia melt, local rain having but small effect on the rivs. The rise of the shiah effect on the rivs. The rise of the Tigris at Bagdad is sometimes as much as 23 ft., and that of the Euphrates as much as 14 ft., at Falujah. At no point is the Plain higher than 150 ft. above sea level. The ann. rainfall on the Plain Newsyng 5 in any and cultivation deaverages 6 in. only, and cultivation de-pends almost entirely on irrigation. There are three chief forms of irrigation: (i.) perenmal, in which form the land is planned and the canals from the riv. to the land to be irrigated are designed in such manner that the water in the riv. will always 'command' the land, or, in other words, flow on to the land; (ii.) from mundation canals, in which form irrigation canals are excavated from the rivs, to the land in such manner that the water, during spring, will command the land, and so give enough water for summer crops—a very unscientific form of crigation; and (ili.) lift irrigation, in which form water is lifted by pump and engine or other mechanical means from the riv. or canals up on to the bank, whence it flows down a small water channel on to lands closely adjoining the enamed on to make cosely autoning the riv. This last form of irrigation has become more popular recently with the cheapening of oil through the development of oil in 1. The chief irrigation works are in the Hindryth Burrage, the Dagharrah Barrage, the Beda Regulator, and the Dialah Weir at Table Mountain. There is a rich date-palm area around There is a rich date-palm area around fasta, and the date trade there is large, 75 per cent of the world's consumption being produced in this area. The Uplands div. forms the area between the Plam and the Highlands, and consists, in the S.W. portion, of an uncultivable gypsum desert, but in the N. and N.E. of rolling oblins with good soil and with a rolling plains with good soil and with a runtiall thrice as heavy as that in the Plain. Mosul, Kirkuk, and Moil, the chief this, are situated on rich soft between 700 and 1200 ft. above the seal vel, the tain being heavy enough tor growing winter cereals extensively. Tho best time to tour these areas is in Apol and May, when the country is very beautiful. There is no irrigation to speak of, though around Arbil and Kirkuk it is carried on in a small way by the anct, system of 'Karez,' a system known in the Middle E, and Alghanistan for centuries. This mode of irrigation is by a series of wells connected by tunnels, the tunnels being skilfully directed, and so inclined as to bring the witer to the surface at the desired spot. The Highlands lie N.F. of a line drawn from Falsh Khabour to Khanaqin, and are crossed by a number of ranges of mts. rising at some points to 14,000 ft. There are many beautiful valleys and plains among those mis., and the valleys are full of flowers. Ramfall is heavy in winter, and may continue till May. The mis. are covered in snow throughout the winter. Fruit is grown in the N., tobacco in the S. Highlands, especially in the dists. of Iragi Tribes — Outside the citic the pop of I is almost entirely tribal, ie divided into communities of Lindred families under their own chiefs or sheikhall it is easy to observe in I the virious stages of tribal development from the nomad of the desert to the riverain cultivator, and in the transit from desert to the (where that has taken place) the tribes have lost little of their tribal characteristics and customs. In the Plan there are Bedouin or Biduin tribes nomadic pastors of canels, sheep and horses others are seminomadic or semi-settled and mush tribes. The three chief I down tribes of I are the shaining between the Figure and Luphrit's in the N-the Dhiffir in the said elsewhere the Arach Blood fouds still prevail and the tribes have their own unwritten codes and inchods of punishing offenders or settling quarters, and the I gov, in its administration in dwelling in black tents remain ent of the time of Abraham while the in a manual passage of the tribe is the citic in the continual he and his family may live in a house.

Constitution and I Immistration — By a

treats of alliance (1330) between Great Butain and I King Laisul ibn Hussain (the first king of I) (ic it Britiin under took to give I su halvice and assistance as might be required without prejudice to Iraqian sovercignty to support the armed forces and tin in es etc of I, and to use its good offices to secure the admission of I to membership of the Leugue of Nations as soon as possible I was admitted to the League of Nations in 1932 I o effect uate this treaty, there was a Brit adviser to each Minister of the Iriquin (abinet, and also a number of Brit officials in each ministry, all being responsible to the I Gov Legislative power is vested in Parliament with the king of I and the Parliament consists of the senate and the The Senate has Chamber of Deputies twenty members or eller statesmen nominated by the king of I and the Lower House 113 deputies elected on the basis of one deputy to every 20 000 male subjects. I is divided into fourteen main administrative divs or liwis each liwibeing administered by a Mutusment being administered by a Mutusairif who is responsible to the Ministry of the Interior but is also the igent and repre Luh sentative of the other ministries administred by a 'Quin Maqquin,' indeath administred by a 'Quin Maqquin,' indeath addhais administered by a 'Yudir' lib Iraq Army—The defence of I during the years following the 1 rest World

The Iraq Army — The defence of I during the years following the I'rst World War was mainly in the hands of the It A I , and see Birt squadrons were stationed in the country. But after 19 2 the R A I command was transferred to Hinadieh, where it is stationed solely to sateguard Brit. inferents. In 1939 the Iraqlan army contained two divs (twenty eight infantry battalions three cavairy regiments, ix batteries of mt. artillery, etc.). The air force comprised two army air cooperation squadrons, one bomber transport squadron, and one fighter squadron.

The total strength of the army and air force was then 28 000 officers and men Compulsory military service for all men between mineteen and twenty five had come into force in 1936. The bulk of the 1 lik and file we shigh taile smen of \$1\$ to but kinds and Inicon ins we enlisted in considerable numbers together with Assiting Chalde in Christian and others also a police force of 10 100 men, half on foot and half mounted. Intiquities —A valuable collection of
intiquities is housed in the I Museum,
which was erected by the celebrated
certified Lowthian Bell (q v), who organised and for many years directed the Antiquities Dept. of the Museum. The color-

in 1928, and there are, besides, antiquities, appointed High Commissioner with power from the carliest period down to 1700 B.C., the whole illustrative of the continuous hist. of I. These antiquities include painted pottery from Kish (q,v.) and elsewhere; inlaid friezes from Ur and Kish; gold, silver, and copper vessels and weapons from Ur; statues from Adah and weapons from Ur; statues from Adah and weapons from Ur; statues from Adah and other places; ivory combs, toilet boxes, pins, etc. from various sites; terra-cottas and numerous other objects of a fascinat-ing character. At Eridu in S. Iraq, a few miles S. of Ur excavations have revealed a temple dating, perhaps, from about 1000 BC., and a cemetery said to be at least 6000 years old. It is divided into brick compartments pointing S.E. and each of these contained implements ovidently intended for the future life. Other finds nearby included the remains of ten temples at different levels. The lowest of these levels also contained a temple of the fourth millennium B.C., and the highest a Sumerian tower dating from about 2200 в.с.

For the results of archaeological excavation, see BABYLONIA :- Recent discoveries :

History of Iraq since 1914,—In 1914, atter Turkey had declared war on the Allies, a Brt. force was landed at Basra to protect Brit. interests in the Persian gult. The force was not originally included a declared to the Turkey and t tended to drive out the Turks, but, attack being often the most effective means of defence, the force advanced up the Tigris. defence, the force busineed up the Archi-Flushed with their initial success, they advanced too far, and eventually capi-tulated at Kut-al-Amara (see Meso-POTIMIAN FRONT; TOWNSHEND, SIR CHARLES). Reinforcements were then obtained and pushed forward in 1917 under Sir Stanley Mande (4.v.) to recapture Kut, which place, after heavy fighting was occupied by the Brit., who then rapidly pursued the routed Turks. They entered Bogdad on March 11, 1917. Gen. Maude then issued a proclamation to the people telling them that the Brit. had come to liberate them from the Turks: that the Brit, wished the people of I, to regain their past prosperity. Hence in 1921 the Brit, Gov. implemented these 1921 the Brit. Gov. inflictmented these promises, and after election by the people, King Fassal acceded to the throne of L. on Aug. 23, 1921. This was not, however, accomplished without opposition and blood-hed. Annost a welter of conflicting interests—Britain's enemies playing off Indian against Arab—Great Britain announced her acceptance of the mandate for I. under the League of Nations. Meanwhile the Arab Gov. at Damascus had while the Arab Gov. at Dannascus masseneron-ended on the Euphrates boundary, with the result that the tribes N. of Bagdad and around Mosul broke out into revoit. This precipitated a general Arab rising in the Mosul region (1920). Reinforcements arrived, however, and order was ancediby restored in that part of the was speedily restored in that part of the country. The Arab tribes in the middle Euphrates region and around Hillah and

to create a Council of State under an Arab to create a Council of States under the Armore president and an elective assembly, the whole of Central 1, rose in arms, and a body of young troops of the Manchester regiment, numbering about 300, were massacred, and numerous Brit. officials were after marginal or of the property of th were either murdered or made prisoner Troops were rushed from India, many of the leaders of the revolt were deported, and order was gradually re-stored, agutation by the Iraq's being further discouraged by the fact that the Fr. had in the meantime occupied Syria, and so ended the regime there of King Faisal. Sir Percy Cox, having assumed office, myted the Naqib of Bagdad, one of the foremost Arab dignitaries, to form a Provisional Council of State. Soon afterwards it was learned that Fasal was journeying to L. as a candidate for the crown, and after a referendum on the rival claims of himself and Ibn Saud, Faisal was duly problamed elected King. Faisal then called upon the Nagib to form a Cabuet, or rather to continue the administration with the members of his Council. It now seemed to the outside world that 'Great Britain could by down the builden she had hardly yet shouldered ' But, as subsequent events showed, the transformation was as yet merely on paper, and all the work of educating the country into the ethics of western in-stitutions was to come. The years 1921 stitutions was to come. The years 1921 22 were marked by further disturbances, notably on the Kurdish border, in the S.W. of L., and, once again, in the Mosul prov. These disturbances were to a large with which country the Allies were still theoretically in a state of war, and, moreover, Butain had shewn pro-Gk. sym-pathies in the Graeco-Turkish war, 1921-22. Brigandage was rampant, and the desert tribes, particularly the Shammar, were creating further difficulty by seeking of the Saud, the Sultan of Najd. The Shammar were the hereditary foes of Saud, and the latter's forces followed them into I, and attacked the I, camel cops and shepherd tribes not far from the radway between Bagdad and Basra. All this trouble coincided with an agitation by Farsal and his prime minister for the complete abrogation of the But, mandate us being inconsistent with Iraq's sovereign independence. At this time I, wanted a tienty in place of the mundate, whereas Britain was aiming at a treaty within the mandate; so that the difference was purely technical, but the position was complitechnical, but the position was compli-cated by an Arab agitation against oven a treaty relationship. Faisal, however, urged on by this agitation, refused to sign the treaty, with the result that Sir Perry Cox assumed sole authority, and by vigor-ous measures against agitators restored order. This accomplished, a treaty was at length substituted for the mandatory relationship attuners as between Great relationship, although, as between Great Britain and the League of Nations, the mandatory obligation necessarily still sub-sisted. Great Britain undertook to secure Bagdad, including the most turbulent in the country, then agitated against the mandatory obligation necessarily still substit. mandate, and, after the announcement that Sir Percy Cox would be I.'s admission to the League in certain

events, the principle of this policy being the ability of I to defend herself. Even if the I. Nationalists had some cause for if the latest and some cause for raising a charge of breach of fatth against Great Britain in regard to I.'s early admission to the League, the whole situation was obscured by the Turkish menace to Mosul, which prov. the Turks flatly refused to cede, trusting to the sympathy of France. Negotiations between Great Britain and Turkey having failed, an International Commission was appointed by the League to adjudicate on the Mosul boundary. The outcome of these deliberboundary. The outcome of these deliberations was that Mosul was given to Iraq, and in Jan. 1926 a new treaty was accordingly signod between Great Britain and I. extending the period of the previously existing treaty from four to twenty-five years after the ratification of peace with Turkey (see LAUSANNE, TREATY OF), i.e. from Aug. 6, 1921, for twenty-five years, or until such time as I. might be admitted to League membership. In 1932, howto League membership. In 1932, how-ever, the mandatory regime came to an end with L's entry into League memberend with 1.8 entry into League membership. Klug Falsal d. in 1933 and was succeeded by his son Chan, who d in April, 1939, as the result of a motoring accident, and w.s. in his turn, succeeded by his mant son, Falsal II. (b. 1935). I. now reverted to its habitual 1935). 1. now reverted to its habitual regime of intrigue and violence. Already the more enlightened parties of Gen. Nuries-Said Pasha and Yasin Pasha, the Nationalist, had been ousted by the machinations of Hikmel Suleiman and Bakir Sidki, chief of staff, in 1936; but Sidki was assessmated by a soldier in 1938 and his colleague Hikmet resigned in favour of Nori Pasha who now returned favour of Nuri Pasha, who now returned from extle. I., under Nuri, sided with Britain in the Second World War and broke off diplomatic relations with Ger many in accordance with the terms of the alliance. But a dangerous revolt was prepared by Rashid Ali in 1911 in communition

with the Gor. gov.

Revolt in Iraq. - A coup d'état, danger ous in its possible repercussions on Brit ous in its possible repercussions on our interests in the Middlo E., was carried out on April 3, 1941 in Iraq by a group of military leaders, their civilian alines being Sayid Rashid cl Galloni, prime infister, and Haj Anun, the ex-Muft of Palestine, who had led the anti-Brit, revolt in Palestine. tine sev. years previously (see Pausettie) and had fied to Bernt and thence to Iraq. After 1936, when Gen. Bacir Sidky set up a dictatorship, ushered in by Sidky set up a dictatorship, ushered in by the murder of Janur Pasha (q.r.) and terminated by his own usas-sination, military interference became chronic in the political affairs of Iraq. Rashid All tried to give the movement a pan-Arab flavour, but there is no evidence that he had much support in his own or in the neighbouring Arab countries. The lead-

d'état which was fomented by Ger. influence and promises of military aid, was timed to coincide with Germany's attack on Libya and in the Balkans, and, no doubt, to enable Ger. agents to secure con-trol of the Iraqi olificides. For long Germany had been exploiting whatever might be to her advantage in Iraq, and her efforts in this direction were guided, as long pre-viously as 1936, by Herr Grobba, the able,

A YOUNG KURD OF BAGDAD

if unscrupulous, Ger. minister in Bagdad. But apart from Ger. influence and the hostility of the ex-Muffi, the Brit. Goy. had long experienced difficulties with the iraqi Army, which had no particular con-nection with Germany, first over con-scription and then over armanicuts, Germany naturally exploited Iraqi dis-aftection on the armaments question which when the war broke out was still a tumbling block between Britain and Iraq. ther agents gradually succeeded in suborn-ing the services of the four chief army mg the services of the four chief army commanders, who became known as the 'Golden Square.' The most remarkable of these was Salah-ed-Din, commander of the W. Army, who, like the ex-Mufti of Palesime, had once served in the Turk-ien army. But it was Rashid Ali who give his name and political influence to the rebellion, a may who came of one to the rebellion, a man who came of one of the oldest and noblest families of Islam, being a descendant of the eleventh cen-tury saint, Abdul Qudir al Gailani, whose memory is still revered in these regions. Rashid himself was an obscure scion among many sons of a wealthy father and among many sons or a weatons in the Turkish had spent the previous was in the Turkish had service. He art entered the Iraqi cabinet in 1926 as minister of the interior. neighbouring Arab countries. The lead-ers of the movement chose a moment when the Brit. Gov. had their hands full in the Balkans and in Africa and when the Regent, Emir Abdul Ilah, was absent from the cap. By treaty arrangements with Iraq, Britain had acquired bases in the country through which to defend her communications E. and W., and the coup over the It. legation in Bagdad. The fact that Iraq never broke off relations with Italy as she had done with Germany enabled propaganda to be continued by It. and Ger. agents with It. passports, Berlin being the directing force. Rashid's actions were not impired by anglophobia. but were rather the outcome of a gradual drift into hopelessness over any pro-Arab solution of the Pale-tine question (see BALFOUR DECLARATION; PALESTINE) and fear of a Ger. victory in the war Gen. Wavell's great victory in the battle of the W. Desert (see abore) had no effect on the Arab mind in Iraq, the It. as a military race counting for nothing in their military race counting for nothing in their eyes. Thus the rapprochement between Rashid Alı and the Gers. new began seriously to 10 copardize Anglo-Iraq relations. The premier's party, averse from a breach with their traditional ally, Britain, left him, and early in 1911 Rashid, casting about for new friends, joined forces with the Golden Square and tried to force the regent to autount num joined forces with the Golden Square and tried to force the regent to appoint puppets to the cabinet (Jan. 1941). The regent, however, escaped to Diwaniyah where the Army commander was loyal. This earlier crisis achieved little and Rashid Ali went out of office, being succeeded by Gen. Taha el Hashimi. The new prime minister's efforts to dislodge the Golden Square, however, proved ahor tive and while the four remained nothing could be done to dissipate the baneful incould be done to dissipate the baneful influence of the It. legation. In April the Golden Square, aided by Ger. funds, took matters into their own hands and, marching by night into Bagdad, selzed all the key positions. Taha rosigned and the regent again fled, while the young king, Faisal II., was kept a close personer. Amidst these events for Kinahan Corner allies to row Burt on the contract of the contract wallis, the new Brit. ambas, arrived in I and skilfully made use of the rebel gov's superficial attitude of conciliatoriness to effect a peaceful landing of Brit. troops at Basra. But the arrival of still more trans ports soon afterwards precipitated the coup of April 3. The liaqi military leaders, relying on the Ger. military aid which never reached them, now decided to get in the first blow. Without warning they made a second night march across the made a second night march across the Tigris and Euphrates to the Brit. air base in the W and took up positions on the low escarpments at Habbanis ah. Thence they attacked the R.A.F. aerodrome. The R.A.F. at once accepted the challenge and very soon their repeated raids on the military aerodromes of Moascar Rashid and on the Bagdad aliport had resulted in the destruction of most of the Iraqi air force and planes. Rashid All's brief Ger-propped regime tumbled as Brit. troops came within 5 m. of the cap and he blin self fled to Iran with his chief supporters His revolt, in fact, had been premature Meanwhile the regent had returned and exhorted the people to join in the fight against the 'Nazi hirelings who had plunged their country into war. The campaign was short-lived. A Brit. mo-bile column, having overcome the Iraqi positions at Habbaniyah, marched on Bagdad, Khan Buqta fell on May 28

The fact ions with then completely collapsed. I. doclared many ented by It. ittle active participation. Sympathy with the Arabs over the Palestine question was a gradual pro-Arab pro-

syii, and Lebanon, in the invasion of Palestine

Irawadi, or Irrawaddy, chief riv. of Burna, is formed by the confluence of the two arms of the Malikha and Meh kha, wak h rise in the N.E. of \squam, near the libtatan frontier, a short distance above Bh amo. It follows generally a course from \to 3, a total distance of 1500 in., and falls into the bay of Bongal, between the bis, of Mattapan and Cape Nogras, through a wide delta with nearly a dozen mouths. The delta is a fertile rice-growing dist, but only two of the mouths, the Bisse in and the Rangoon, are navigable for big boats. The chief tribs, are the Chindwin and the Shwell, and the chief tris, on its banks are Bassein, Rangoon, Prome, Ava, Mandalay, and Bhamo. The riv is the great highway for commercial traffic, and drains an area of about 1 15,000 sq. m. of very fertile land. See also Burma, Second World War, Campalons I.

Irbit, tn. in the Sverdlovsk Region of the R.S.F.S.R. at the junction of the Irbit and Nitsa, 110 m. N.E. of Ekaterinburg. It

is connected by steamboat lines with the prin. tns. of the Obi Valley, and has a large ann. fatr in Feb., considered the most important, in Asiatic Russia, and attended

by a number of European and Asiatic merchants. Pop. about 20,000. Ireland, John (b. 1879), Eng. composer, b. at Howden, Cheshire, son of Alexander 1. He was educated at Leeds Grammar School and at the Royal College of Music, studying under Stanford. Began with concerted chamber music and songs. Two violin sonatas followed, and these estab. his reputation at once. His best-known subsequent works are a pignoforte sonata, Mai-Dun, a symphonic rhapsody (1921), and a mano concorto. Has also written a number of songs, one of the best being the setting of Mascfield's Sca Fever, and shorter works for the pianoforte. Other works include the song impression Maragold; the Land of Lost Content, being song

gold; the Land of Lost Content, being song settings to A Shropshre Lad. His work is characterised by its austerity, lyrical beauty and sincerity. See study by R. Hill in A. L. Bacharach's Eritish Music of our Time, 1940.

Ireland, William Henry (1777-1835), forger, inherited the interest of his father, Samuel Ireland not in the works of Shakespeare; but in him it took the form of inventing documents concerning the poet, and imitating his handwriting and signature. The forgeries were so well executed that they deceived, not only Samuel I., but such men as Dr. Parr, Sir Isaac Heard, and Dr. Warton. In-Sir Isaac Heard, and Dr. Warton. couraged by his success I. wrote two plays, Vorligera and Rowna and Henry II., which he ascribed to Shakespeare. The former was produced by Sheridan at Driny Lane in March 1796. Malone exposed the frand, which the perpetrator acknow-ledged in his Authentic Account, 1796. This was expanded (1805) into his Con-

fessions. fessions.

Ireland, is. lying to the W. of Great
Britain. It is separated from Great
Britain on the E. by the N. Channel
(134 m. wide) and the Irish Sea (130 m.),
and on the S. by St. George's Channel (47
to 69 m.). It is encircled on the N., the
W., and the S. by the Atlantic Ocean. In
shape the is. is an irregular rhombold, the
Greatest diagonal from N.E. to S.W. greatest diagonal, from N.E. to S.W., being 302 m. in length. The total area is 32,605 sq. m. 1. is divided into two states,

32,003 et in.

N. Ireland and the Republic of I. (Eiro), the former being part of the United Kingdom.

Climate.—The climate of I. resembles that of Great Britain, but is more equable. It is influenced by the Gulf Stream and by the S.W. winds. The prevailing winds off the ocean cause a greater amount of rainfall, and the rain is more evenly dis-tributed over I. than over Great Britain. In the latter country the mts. in the W. present a burrier to the S.W. winds; but I. has no mt. ridge lying N. and S., which fact accounts for the more equal rainfall. The constant rain promotes luxuriant vegetation, which has given I. its name of 'Emerald Isle.' The nean temp. in Jan. is seldom below 40°, while in July the extreme mean temp. are 58° in the N. and 60° inland.

Area and Population.—According to the census of 1946, the following are the areas and pop. of the provs., cos., and co. bors. of the Republic. The names of the caps, appear in parenthesis :-

igneulture—The soil of I is rich and cm nontly suited to tillage, but political trulles have retarded agric development. Then unber of small holdings allotted has been nordinately large and the average size of each extremely small. Moreover, the excessive moisture of the atmosphere in th. S and W region is dotrimental to the cultivation of ecreal crops. In 1899 as lept of agriculture was estab whose dures include the provision of agric instruction, as well as administrative work with regard to the improvement of lives to k. Much of the land formerly used for tillage has been withdrawn gradually during the fifty years 1880 1930 for pasturage. The cause has been attributed infectly to the emigration of the power classes resulting in a dearth of labour, but in more recent years there has been strong effort to increase the area under tillage. The chief green crops grown are potatoes, turnips, carrots, mangel wurzel, beet, cabbage, etc. the cereal crops in clude barley, onts, and wheat, and flax is grown in large quantities in Ulster. With

the increase of pasturage, there has been a much larger return of live stock with a

smaller output of agric. produce.

Agric. policy in kire has fluctuated in the past seventeen years. Until 1932 when the de Valera Gov. took office, the policy was to specialise in the production of live-stock and live-stock products. The area under corn crops declined from a maximum of 1,456,000 ac, in 1918 to 760,000 in 1932. But the output of storeh tons of corn, root and green crops, and hay fell only from 2,761,000 tons in 1918 to 2,410,000 in 1931. Meanwhile the area under grass had increased as the area under the plough diminished. In 1932 the official policy was to speed the plough at all costs and encourage, by a system of guaranteed prices and import restrictions, the growing of food crops for domestic consumption, especially wheat and beet. But total agric, output, after a temporary spurt, began to show a down-ward trend and in 1938 was only 98 per cent of its volume in 1929. In the late 1930's the gov. found that its effort to promote a tillage economy, based on a declining animal husbandry, was disintegrating Eirc's national economy as a whole and destroy of the natural fertility of the soil. But the outbreak of the Second World War made it impossible to apply the lessons learnt. Eire was com-pelled by external circumstences to plouch up an increasing acreage of pasture land in order to obtain a grain supply, the total of which failed to increase in equal proportion and was always inadequate. million ac. of pasture land were sacrificed in the process. Inevitably the output of milk and cattle suffered. In 1929-1930 Eire exported 51.4 per cent of total agric. output, consisting almost entirely of live stock and live stock products. In 1942-43 the percentage exported was only 23.5 per cent. In 1912 a committee was appointed to report on the measures best calculated to provide for the agric. Industry at the end of the emergency period. The majority report of the committee, pub. in 1945, recommended a policy of key farming, a blend of plough specific and there is now substantial agreement bethere is now substitutian agreement between the gov. and opposition parties on this policy. Meanwhile the new grass policy is rapidly increasing the output of grass, fresh and preserved, and it seems likely that there will not be enough eattle nety that there will not be unugar extractional method of preserving grass for winter keep, sliage making is rapidly gaining ground. Mechanisation in Eire is making progress. Until 1939 Irish agriculture was comparatively little mechanised and was comparatively little mechanised and the state of the sta until 1932 hardly at all. In 1939 there were 2067 tractors available; in 1948 there were 9781 tractors, and the number is rapidly growing. A number of cream-ories in the S. of I. have bought farms which they run on a commercial basis. They equip them in the most modern way and the machines they own can be hired out to members as well as used on the common farm.

with great success, and during recent years there has been a marked improvement in the purity of the breeds raised. The lisheries form an important industry of the Irish people. In kire in 1946, 3 steam vessels, 576 motor, 761 sail, and 2120 row boats were employed in the trade. The total crews amounted to 10,162 men and boys in 1945. Mackerel, bake berring sale cod lobsters and hake, herring, solo, cod, lobsters, and ovalers are among the fish caught and sold. There is, too, a good deal of rod- and linetishing in the rivs., and salmon and trout are cought in large quantities.

About twenty-one species of mammals that occur in Great Britain are unknown in I. The mole, weasel, and pole-rat are unknown, and the only kind of reptile found is the lizard. The blue-hare is indigenous, and frogs and toads are very common. It is probable that I. was isolated before the complete European launa was able to enter it from the E The flora of the S. region includes some Pre-nean types that are not found in

Great Britain.

The nineral produce of I. is small when compared with that of Great Britain Cosl is mined near Lough Allen and at Cost is, in co. Tyrone. Black marble is quarred in counties Galway and Kilkenny and a counties Galway and Kilkenny and a counties Galway and Kilkenny and red marble near Cork. Salt is made, being raised from the Triassic beds near carrickfergus, and barges, pyrites, and lead ore are also produced. Other university are limestone, which is chiefly found in co. Roscommon, iron ore, sand, clay, bauxite, and green Connemara murble.

Manufactures flourish chiefly in the N.E. of Ulster. The most important seat of the linen industry is Belfast, where it was introduced by Strafford in 1633 That tu. also employs about 40,000 men in engineering and shipbuilding. in engineering and shipbuilding. The was mobiled industry, which at one time was in a very flourishing condition, was later hampered by restrictions imposed by the little Parliament. Other industries are brewing and distilling, embroidering, hand Inc. work, and other home industries. The chief exports are all kinds of agric. pro-

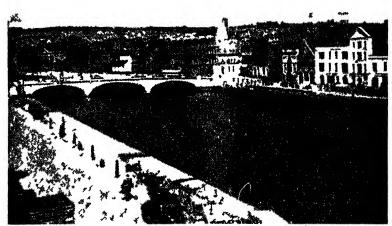

duce, live stock, fish, and linen.

Communications.—The first railway
was opened in 1831, and ran between
Dublin and Kingstown, a distance of 6 m. There are 741 m. of rulway in N. I. and 28.4 m. In the Republe. The canals are ters important for commercial purposes. The chief are the Grand and Royal, 208 and 96 m. long respectively, which afford communication between Dublin and the shannon; and the Ulster Canal which connects Lough Nearl, with the Shannon. There are 180 m. of canals in N. I. and in the Republic 650 m, of inland waterways. the Republic 650 m, or minim waterways, here are mail steamship services between Dublin and Holyhead; Belfast and Hey-sham, Fleetwood, Liverpool, and Ardro-an; Larne and Stammaer; Rosslare also Waterford) and Fishguard. Many Amer. imers call at Cobb (Queenstown) for Cork d the machines they own can be hired on the S., and others at Belfast, London-to members as well as used on the derry or Moville on the N. The coasting mmon farm.

I ducation —In N I there are 1727 elementary schools, 75 secondary schools, to technical schools, and one university, Queens University, Belfast In hire there are 5212 elementary schools (elementary education is free and 12 given in the national schools and, since 1922 the Irish language has been included as an essintial part of the curriculum for all national schools)

There are 329 recognitions and the curriculum for all national schools.

The following private (atholic colleges at Maynooth, Blackrock, so licensed Weston () inhife, Carlow, etc. Climbiffe, Carlow, etc.

History -The earliest hist of I is not unnaturally wrapped up in myth and legend We have little cyldence in any authors of note regarding I, and factors which contribute greatly to the hist of other nations are lacking here, hence we are compelled by the little we have to rely upon the probabilities suggested by research Fyidence of the inhabitation of the fittence of the innamestion of the Neolithic peoples indicates that even after the Celtic settlement of I great rumipers of the carlier inhab survived, and intermarriage between the Celtic and pre Celtic tribes took place to an even greater extent than was oustomary in the land actified by Celta. The first national schools, increase are 323 recog even greater excell than was customary nised and state inspected secondary in other lands sctiled by Celts The first schools, all receiving grants from the State, and open to inspection by the Fdu during the sixth century 8 c, and about the prin this. The Univ of Dublin Celtic settlement of Brythones. Ptolemy, during the sixth century BC, and about three centuries later we find a further

who gives us our earliest knowledge of I., states the names of at least sixteen tribes. These names bear a striking resemblance to the tribal names of the Celts in Britain, e.g. we find the name Brigantes in both countries. The div. of the country into provs.—Ulster, Munster (E. and W.). Leinster, and Connaught—seems to have been made by the earliest Coltic settlers.

By the beginning of the Christian era we may say that I. was populated by Celts (Goidels and Brythones), together with a sprinkling of the Neolithic people and some Picts, who probably came from Scotland, and who occupied but a small portion of the country. Such is the explanation that hist, gives of the early settlement of I. The Irish, however, account for it in a very different way—a series of legendary stories, in which mythical characters, who have become almost historical, play an important part. According to legend, the first invaders came under Partolan, occupied the is, for 300 years, and were then killed off by a great plague. They were followed by the Nemodians, who came from Scythla and had a great struggle with the Fomorians. The Fomorians were ultimately successful and the Nomedians were driven out and went away to Greece. From hence, after various adventures they returned to 1., this time being given the name of Firbolgs, and this tribe settled in I. and have been held to be represented there down to the sixteenth century. The next set of invaders were the tribes of the God Dann, who finally overthrew both the Firbolgs and the Formorlans The tribes of the God Danu are supposed to have come originally from Greece but to have been driven up to Scandinavia, and from thence to have invaded I.; they held supreme command of I. down to the time of the arrival of the Milesians. The Milesians are supposed to Milesians. The Milesians are supposed to have come originally from Scythla, to have sojourned in Egypt, and to have finally invaded I. and conquered it. This myth is historically the most important since the Milesians are held by historians of the sixteenth century to have given the line of the high kings to I. down to the twelfth century. Names are given to the early kings and records of their deeds were kept, but of these we may take little or no notice until the appearance at the end of the fourth and beginning of the fifth cen-turies of Niall of the Nine Hostages. He is held to have finally set up the central kingdom of Tara, and to have led expeditions of the Irish overseas. It has not yet been fully recognised to what an extent I, and Wales were connected during this oarly period, and it must be pointed out here that the expeditions of Niall of the Nine Table State Connected that the expeditions of Niall of the Nine Table State Connected that the expeditions of Niall of the Nine Table State Connected that the state of the Nine Table State Connected that the state of the Nine Table State Connected that the State Co Hostages synchronise with the departure of the Rous, and the raids of the Picts and Scots into Britain. Certain it is that colonies of the Irish were formed in Wales and in W. Wales (Devon and Cornwall), and it is to this period in Irish hist, that we can best trace the foundation of these colonies.

historian and abbot of Clonmacnoise in the eleventh century, as heralding the dawn of Irish hist. It may be said, generally, that Irish hist. is reliable as to genealogies and the broad features of the prin. events from the Christian era and that it is fairly reliable, from a remote period, as a guide to such outstanding events as the foundation of Emania and the victory of Labraidhe (Lowry), grandson of Laoghaire over the usurper Cofley at Dinn Riogh on the Barrow. It is, however, not until the time of Patrick that there are definite political subdives that there are definite political sub-divs. in I as distinct from the mere supremacy of certain families in various parts of the country. A short time prior to the Chris-tian era the most powerful kings in I. were those who ruled in Emania. Thus to Tunthal is attributed the foundation of the kingdom of Meath and the great dynasty of Tara, which governed the clans of the open plain from the sea to the Shannon and later appointed branches to rule over those of more than half of Ireland. There were two other dynastics the origin of which is assigned to the second century: the Leinster and Mun-ster, whose kings were rivals of Conn, famous grandson of Tuathal; and the three leading dynastics supplied the independent rulers of all parts of I. except Ulaidh (Ulster) for centuries and struggled with each other for the supremacy of the country. Tara reached its zenith in the country. Tara reached its zenith in the regn of Cormac MacAirt, a grandson of Conn, who is one of the prin. figures in the copious literature on the exploits of the Fianna or 'Fennans'. The kings of Tara had attained such power in the fourth century that they were then waging war in Britain and oven sending military expeditions to the Continent. The Rom. dominion was on the wane and the Gaels came over to make common cause with the enslaved Britons and Picts against the the custaven bruoms and Piets against the flows. One of the most famous leaders of these expeditions was Niell, king of Tarn, whom we have mentioned above, who was eventually slain on the banks of the Loire (A.D. 405). During Niall's reign his two half-bruthers Braan and Flachra estab. themselves in the palace of Crunchan in Resconnent, and thences ('ruachan (in Roscommon) and thenceforth the kings of the W. kingdom were chosen exclusively from their descendants. Other new kingdoms were founded in the N.W. near the site of the modern Derry. The state of Oriel was also founded at this time It had been wre-ted shortly before the Christian era from the Clanna Rury, the most powerful kings in I. Their sway extended from Ulaidh and in early times spread over nearly all the N. and as far S. as Taillte in Meath; but following the seven years' war between Connor and Maeve of Connacht, in alliance with Fergus of the Red Branch, the power of the Clanna Rury steadily declined.

Immodiately before the introduction of christanity we find the permanent estab. of four kingdoms ruled over by the posterity of Conn — Tara, Oirghialla, Aileach, The foundation of Emania, c. 300 s.c., and Cruachan. The normal head of this seat of the kings of the line of Ir in the N. confederacy is the chief king in kire, is regarded by Tigherneach, the famous styled High King, a purely nominal title

but implying a superiority which was not Centuries before the Christian era, they recognised by the dynasties of Ulaidh, are said to have estab, a Fels or central Laighin, or Caiseal (Ulster, Leinster, and parliament which assembled triennially at recognised by the dynasties of Ulaidh, Laighin, or Caiseal (Ulster, Leinster, and Cashel). These seven independent States into which the is, was divided at this time remained—albeit modified under changing conditions—the spheres of political in-fluence in I. until the whole Gaelic fabric was destroyed at the battle of Kinsule in 1603; but to trace the fortunes of these seven dynastics is the purpose of any hist of Gaelic Ireland. Their supremacy in their own kingdoms remained permanent and the rivairies which often convulsed them were between competitors of their own families. It is possible that Christi-anity conduced to this political stability. The traditional Five Provinces (Ulaidh, Connacht, Laighin, and the two Mumha) are popularly supposed to be represented by the modern four provs.; but the repreby the modern four provs.; but the representation is not wholly accurate. The first div. into four provs. was eccles, when the Synod of Kells (1152) grouped the Church around the arch-dioceses of Armagh, Cashel, Tuam, and Dublin. The creation of prov. 'presidents' in the sixteenth century by the Tudors gave them definite recognition in nolitical effuris definite recognition in political affairs. The accepted index to the internal political constitution of these Irish states is the 'Book of Rights' (Leabhar na g-Ceart) traditionally ascribed to St. Benignus, disciple and successor of St. Patrick.

The religion of early I. cannot be easily traced. The inhab, appear to have had many gods, in fact, to a certain degree, to have been pantheistic; there is evidence also to show that they were fire worshippers, and we know that right up to the fifteenth century the sacred fire at Kildare was kept burning. The most tangible side of the belief of the early Irish, however, is their undoubting faith in the existence of fairies. The tribes of the God Danu are held, after the invasion the God Danu are neid, after the invasion by the Milesians, to have disappeared into the hills and to have reappeared as fairles. We have also lists of the names of the Irish gods, but these gods seem to have been very shadowy beings concerning whom little is known. The priests or druids of the country play an important part as teachers, prophets, and wizards. Their powers were great, and it was supposed that they were able to nesform posed that they were able to perform miracles. One side of the belief of the Irish must not be overlocked here, since it survived for some very considerable time during the Christian period, and that is the idea that after death certain changes could be made by the dead person, and that he could appear new see wolf and that he could appear now as a wolf, now as a fish, and again as a bird. Only certain people were held to have this power, but in one case at least it was held that all the inhab, of Ossorv could change themselves into wolves at will.

Irish historians aver that the country had reached a high state of civilisation at the coming of St. Patrick. The Irish Milesians are described as a martial and cultured people who, in an age when most of Europe was still in an uncivilised state, held their Ollembs, poets and historians, in equal reverence with their royal chiefs.

the Ard Righ's or High King's court on the Hill of Tara. Thither came the Files or poets, the Seanchuldhes or chroniclers, the Ollumbs or teachers, the Brehons or judges, the druids or priests (considered by some to have been rather magicians and teachers than priests), and the chief-tains and kings of the various tribes, to approve or amend the old laws, make new laws, dispense justice, and to record their annals. The laws made in anot. I., known to-day as the Brehon laws were, for that remote period, so wonderfully just, wise, and equitable, as to win the admiration of modern law students. Again, the beautifully wrought brooches and other ornaments of the I. of pagan days, still extant and preserved in Irish museums, reveal their progress in art and

refinement in dress.
Some of the Irish are said to have been Christians when St. Patrick arrived in 432, but it is a fallacy to suppose that the country had been partly converted before then. Christianity had already been the official religion of the Rom. Empire for a century, the Irish and Roms, had for a long time been in close contact, both commercially and in warfare, there was a con-stant influx of Brit, slaves and continuous stant influx of Brit, slaves and continuous intercourse between the Brit. and the Irish: from all of which it is reasonable to suppose that Christianity was known and practised among the Irish before the coming of St. Patrick. Some of the Irish saints, such as Ailbe of Emly, Declan of Ardmore and others, are said to have been Christians when St. Patrick came, and to have submitted to Aim. But the number of Christians in I. then must have been small, and there was no organised Christian church before the time of St. Patrick. The relations between I. and Britain were very intimate. A Brit. Christian Church had certainly been founded long before this date. The growth of Pelagianism in Britain had, before the end of the lifth century, made before the end of the fifth century, made It be essary for Rome to send missionaries to stamp out the heresy, and one of these missionaries, Palladius, was certainly sent missionaries, Palladius, was certainly sent to I. Christianity, however, whilst probably well known in the S., had made little progress In the N. and W., hence it was to these parts that Patrick gave his own personal attention. He himself, born in Britain, had been englayed and had spent seven years of early manhood amongst the Irish, hence he was familiar with their He took with him at least two followers who spent their time in the S., spreading the gospel and organising the churches. Patrick took for himself those parts which had been touched but little by the Christian time time to the churches. had been bouched but little by the Christian faith. His success was great, but has probably been overrated; in any case he found great opposition, and he allowed numberless practices which did not actually run counter to the doctrines of Christianity, but which had been accepted by the Irish in pre-Christian days. The system of scalety made it exempted the system of society made it essential that

he should convert the heads of the tribes before the faith was accepted by the tribespeople, and he succeeded in establishing a system by which native Irishmen became pricets and in turn converted their brethren. Schools and churches were erected, and the see of Armagh estab. I, in this way became definitely connected with the W. Church. Bishops were consecrated, the land divided into diocess which probably coincided with tribal divs, and the Church definitely estab. throughout the land. The Church was, however, during the centuries which followed, to adopt a very different system from that set up by Patrick. The Irish Church has to a very great extent be in regarded as a monastic church, but this was certainly not the system set up by St. Patrick. The Church was founded on practically a personal basis, religious colonnes originating from one centre be amo and remained daughter settlements of the parent body. The head of a religious foundation was the possessor both of spiritual and temporal rights, and frequently it came to pass that the headship of a religious foundation

rne nead of a religious foundation was the possessor both of spiritual and temporal rights, and frequently it came to pass that the headship of a religious foundation passed entirely into lay hands.

The monastic system was early introduced into 1., e hours if was not until Christianity had gained a firm hold on the country that the form neally associated. country that the form usually associated with I. appeared. The earlier type seems to have been somewhat loose and to have led to much disorder. Further, the Irish hishops did not have any territorial jurisdiction and the consequence was that the number of bishops was very large. Each tuath, or tribe, had, however, a bishop who was recognised as an official momber of the tribe and who had a considerable amount of influence and power. Judged by the standards of W. Europe the Church in I. was morally somewhat lax, but this was probably due as much to the struggle between the old and new religions as to anything else. Finian was the founder of anything eise. Finian was the rounder of the famous monastery at Clonard which was the beginning of the foundation of that series of monasteries which made I. the centre of learning for W. Europe. Scholars flocked to these monasteries, which were amply encampments of students, i.e. a series of mud huts built by the students themselves. Here they lived and provided themselves with food by their own labour and received also by their own labour, and received also their learning in the open air. These monastic settlements were conducted on monastic settlements were conducted on lines very nuch more severe than the earlier had been. The monks were shut off entirely from the latry, and the sexes were separated. This monastic move-ment seems also to have been accompanied by much missionary enterprise. Mis-sionaries of the Celtic Church went everysionaries of the Celtic Church went everywhere—Columba to Iona, Aldau to Northumbria, Columbanus to W. Europe. In the Orkneys the Celtic Church was estab, and Iceland, when discovered by the Vikings, was found to have been visited previously by missionaries of the Celtic Church. The Saxon kingdoms in the N. and centre of England owed their converted to the huissionaries from Iona. St. sion to Irish missionaries from Iona. St. Aldan became the first bishop of North-

umbria and was succeeded in Lindisfarne by two other Irish monks. The Irish missionaries had brought learning as well as religion, and Northumbria became the cradle of Anglo-Saxon literature. The greatest of the Irish missionaries to Europe was St. Columbanus, a native of Leinster, who laboured for twenty years in Burgundy. Numerous sermons, letters and poems written by him are extant and testify not only to his wide range of knowledge, but also to the high state of learning in the Irish schools where he acquired it. The Irish missionaries soon found them-The Irish missionaries soon found themselves in opposition to those of Rome. The Rom. tonsure had probably been introduced into I. by St. Patrick, but the Irish had certainly gone back to the old drudic tonsure, whilst on the matter of calculating Easter they had remained true to the Jewish method The following were the more celebrated saints of I. and the schools with which meet of them were were the more celebrated saints of I. and the schools with which most of them were connected: St. Benignus, a native of Meeth, favourite disciple of St. Patrick and his successor as Archbishop of Arfamous convent in I., at Kildare; St. Charan, of Meeth, who founded the monastery and school of Clonmaonoise on the Shannon, in which many important Irish annals were compiled; St. Brendan, who founded the monastery of Clonfert; St. Finian, of Moville, who founded the school Finian, of Moville, who founded the school of Moville (near Newtownards); St. Combgall a native of Ulaidh, who founded in that dist. the monastery of Bangor, whose fame rivalled that of Clonard and in which many of the Irish nissionaries were educated; and St. Carthach, of W. Mun-ster, who founded the famous school at Lismore. The few prominent names men-tioned here represent but a small part of the work for Christianity performed in the work for Christianity performed in Europe by Irish zeal. Most of it was done by unknown monks in the many monas-teries scattered over W. and Central Europe. These were continually being recruited by monks from I., who for ages continued the labours of St. Col unbanus and St. Gall. Irish influence on the Continent was the result of no transient effort, but was due to a great movement which endured for six centuries, from the which endured for six centuries, from the

sixth to the twelfth.

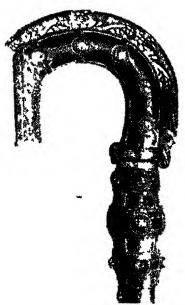

From the fourth to the eighth century the political hist, of I. is a long story of relentiess and practically uninterrupted tribal warfare. The descendants of Niall of the Nine Hostages remained ardri of I. down to the beginning of the eleventh century, but were seldem powerful enough to be able to maintain peace in the country. The Church was not strong enough to perform the work of the ardri, and moreover, the personal character of Church gov. made the Church often a party to the quarrels of the tribes. The descendants of Niall of the Nine Hostages were divided into two great branches, the S. Hy Niall and the N. Hy Niall. At the beginning of the sixth century the Scots from Dairlada made their settlement in Argylishire, and ultimately. after strenuous struggles, obtained the crown of a more or less united Scotland (see Scotland)

the same century Tara coased to be the residence of the ardri, many legends being connected with the desertion of this centre. The records tell us only of constant wars, constant successions, and short reigns The country was in a state of anarchy. One event alone needs to be mentioned, the attempt to rule Dalriada (Argvilshire) as a subject kingdom of the ardri of I, this attempt, however, was given up. The position of the ardri was unenviable. He could command no real allegiance save that of his own immediate tribe. The army of I. consisted of the tribes commanded by their own chiefs. The chiefs owned silegiance to the ardri, but allegiance of such a shadowy type that it counted for nothing. Such was the state of I. when the Vikings began a series of raids which developed into a settlement.

The first invasion of the Norsemen occurred towards the end of the eighth century

The Norwegians were the first century The Norwegians were the first to come, and, aided later by the Danes, made settlements on the E. coast Irish writers distinguish between the natives of the two countries the earlier who came from Norway, are called Fronn gaill ('White Foreigners') and 'Lochlanns', the Dub gaill ('Black Strangers') or 'Danars' came later from Denuark The distinction between them is how ever the distinction between them 19, however, not clearly marked and they are often con-fused. In popular language the invaders are collectively known as the Dancs, while the Noise, or Vikings, or Ostmen The domination of I by the invadors for over a conting was not altogether a misfortune, since it brought that country into closer since it brought that country into closer contact with the countries of the Continent and with W civilisation. Many of the Irish tribes fought in the armies of the Danes who invaded England Foreign trade, especially with Scandinavia, flour land After the middle of the tenth century there rose to fame in Ireland the great Party Lewron a Libests purpose the great Brian Boruma, a Dalcals prince who defeated the Danes and forced them into the position of a subject race bitter struggles with the reigning dynasty Brian managed in 1002 to become ardri himself, and during the twelve remaining years of his life he ruled a penceful and prosperous I He strengthened justice, prosperous I He strengthened justice, he made good laws, and he built schools But he had still to face the hostility of the Danes and the fealousies of the Irish chieftains. In 1011 was fought the famous chieftain. In 1011 was fought the famous battle of Clontarf, which again broke the power of the Danes, but in which Brian himself was killed. His death was a serious blow to monarchy in I and led in the century or more following his death to the weakening of the central power and internetine strife. The hist of I from the battle of Clontarf to the Anglo Norman invasion is the record of contart to the Anglo Norman invasion is the record of contart and contarts. tinual strife, between the O'Briens of Munster, the O'Neills of Ulster, and the

was one which perplexed the Eng. primates during the Norman period. Neither were the relations between the Irish Church and Rome intimate, although in the inster of Easter and the tonsure the Irish thurch had conformed to the usages of Rome. Dublin was regarded as an Fing diocese under Canterbury, and from this beginning the Eng primates had hoped to bring the whole is, into their fold. The synod of Kells of 1152 divided I. finally into dioceses, did much to abolish the anarchic state of Church gov., and made Armagh the sect of the primacy.

the battle of Clontarf to the Anglo
Norman invasion is the record of con
tinual strife, between the O'Briens of
Minster, the O'Neills of Ulster, and the
O'Connors of Connaught for the ardrishp
of Ireland The relations with England
during this period were not intimate,
but were nevertheless, usually fairly
cordial. The question of the Church in I.

religion there. carrying out of two reforms in particular : the first of these was the organisation of definite dioceses. This work of reform and organisation, begun 40 years pre-viously by Gilbert, bishop of the Norse of Limerick, and Celsus, bishop of Armagh, and carried on by Mulachy, was com-pleted at the Synod of Kells. A National Church arose, and the unity of the Church in I. was clearly estab. under one recognised head but with full recognition too for the various constituent elements. The other great reform to which Malachy devoted himself was the revival of the monastories. Most of the early monastic institutions in I. were independent bodies, the Columban monasteries being the sole instance of an affiliated Order. The strict discipline of these rules had been relaxed and Malachy resolved to restore it. The Canons Regular and the Cistercians, who practised the severe discipline estab by the Irish missionaries in Europe, were em ployed by Malachy to restore the old monastic spirit in I. and for that purpose he brought communities from the Continent and sent Irish students to be trained in European monasteries. The Irish had, between the four.) and twelfth centuries, advanced but little to far as their social conditions were concerned. A species of feudalism had grown up, but the tribal system and the Brelon law remained in existence. When Henry II, succeeded to the Eng. throne he had already planned the conquest of I. Pope Adrian IV. had given his sanction to the idea, and had desired the conquest as a means of bringing the Irish Church into closer contact with Rome. In 1166 Dermot Macmurragh, exiled from I. because of his tyranny, and exiled from 1. occause of the tyranny, and also because of the hatrod he had roused by carrying off the wife of the chieftain of Brefin, arrived in Aquitainc and asked for help from Henry II. The king was at that time too much occupied with other affairs to attend to Irish matters himself, but he gave Dernot permission to raise forces from amongst his Lords of the Marches, Dermot applied to Richard de Clare, earl of Pembroke (usually called Stronghow), and by promising him the hand of his daughter and the ultimate possession of his kingdom, induced that earl, whose for-tunes were not at their highest level, to help him. Strongbow did not cross over until 1170, but Fitz-Stephen and Fitz-Maurice crossed with a small company of men in 1169, and began the Anglo-Norman conquest of I.

It is impossible to follow here the for-It is impossible to follow here the for-tunes of the first adventurers; suffice it to say that by their superior skill and their united efforts they restored Dermot and paved the way for the overlordship of Henry II. which that king estab. when he visited I. in 1172. The kings of I. were forced to acknowledge Henry as their overlord, the country was placed under the administration of a Norman governor, the barrons who had fought in I were the barons who had fought in I. were

He set before himself the their old Brehon law, and the Anglotwo reforms in particular Normans were left to maintain themselves in their dominions as best they could. The hist, of L for some time after this date is the record of continuous strife between the Norman barons attempting to extend their power and the Irish attempting to retain their customs, laws, and civilisa-tion. The conquered ter. was known as tion. The conquered ter. was known as the Pale, and the whole of I. was ruled nominally by a Norman governor. John was made Lord of I. in 1185, but soon made himself hated, as he was later in England. The real rulers of the land were the De Lacys, who had been granted huge ters, by Henry II., and who, by subinfeudating their land, introduced those great Norman families who have played such an important part in the bist. of I. lburing John's reign, however, Eng. power Such an important part in the nist. of 1. During John's reign, however. Eng. power increased, as it did also under Richard Stronghow and during the reign of Henry III. The reign of Edward I. saw the power of the colonists still on the increase to such an extent that they were able to help I dward in his wars with Scotland; but although in Connaught and in Uister the power of the Eng. was still increasing. nevertheless the Celtic tribes were not yet utterly beaten. During the reign of Edward II. Edward Bruce tried to conquer the is, and to drive the Eng. out, but quer the is, and to drive the Eng. out, but after sev. fulile victories he was finally overcome and slain at the battle of Dundalk. The reign of Edward II.L witnessed the passing of the Statute of Kilkenny, which forbade the inter-marriage of the Eng and the Irish; it also saw the creation of the earldoms of Desmond and Ormonde, added to that of Kildare, Richard II. led two expeditions to I., with both of which he did little good; the Celtic reaction was strong and was strengthened reaction was strong and was strengthened by the Anglo-Irish baronage. One of the main results of Richard's second Irish expedition was that it allowed time for the house of Lancaster to usurp his throne. The period of Lancastrian rule was one of extreme misery for I. Henry IV. could do little, Henry V. was too buslix occupied do in the, Henry V. was too busit occupied elsewhere to turn his attention to I., whilst Henry VI.'s regents did very little indeed. Richard of York was made governor of I. in 1449 for ten years. He ingratiated himself with all parties and became extremely popular. Edward IV.'s reign was remarkable for nothing save its landespass and the fact that Tritott each lawlessness and the fact that Tiptoft, earl of Worcester, became governor of the is. and was responsible for much bloodshed. During the reign of Henry VII. was passed the famous Poyning's law, which gave control of the Irish legislature to the Eng. council, and was responsible for much contention at a later date. The earl of kildare esponsed the cause of Lambert smuol in 1487, but certain of the Irish, and in particular the tn. of Waterford, were strong supporters of the Tudors. Henry VIII, did not turn his attention to I until fairly late in his reign. By this time the Anglo-Irish families were Irish in granted Irish lands, and the Irish Church almost every respect. They no longer was brought by the synod of Cashel Into acknowledged any law save that of the complete union with the Church of Rome. It is the king The Irish were, however, allowed to retain struck with a heavy hand, the power of

the house of Kildare was broken, and the the house of Kildare was proken, and the country was slowly rescued from the hands of the foudal lotds. Henry himself adopted the title of king of L, and the Irish were gradually brought to look to the power of the crown for the redress of their grievances. The native chieftains of their grievances. The native chieftains were also granted titles from the crown and were encouraged to come to count as often as possible. The reign of Edward VI. saw the beginning of the attempt to introduce Protestantism into I. The attempt was a failure, although it was supported by those in authority. The surcere Catholicism of the people was only too evident, and Mary had no dealeulty in restoring the old faith, but the monastic lands which had been suzel were not given back, and in fact Protestants from England found in Dublin during Mary s short reign a place of reture from persecution.

We may revert here to a consideration of the hist, of the progress of the Reformation in I. in the Tudor period. Henry VIII.'s doctrine of his excles, supremacy received little support in 1, where there was no desire for religious innovations. In 1535 Henry appointed a commission to initiate the enforcement in 1. of the Re-Browne, an Eng. Augustinian friar, who had been chosen archielled of Dublin by the king and consecrated for that office by Oranmer, archbishop of Cauterbury, withort any authority from the Pope. But the new archbishop secured only the sup port of the bishop of Meath, and he quarrelled violently with the deputy viceroy, Lord Leonard Grey. In 1536 a parliament, assembled in Dublin, was required to pass 'the Act of the Supreme Head' providing severe penalties for those who obstinately refused to a knowledge who obstinately refused to acknowledge the king to be head of the whole church in I. By another Act, 'first fruits' of eccles offices were to be paid, not to the pope, but to the king. Henry's next step was to undertake the dissolution of the Irish monasteries and convents. There were in I. about 600 religious houses, including seventy convents. By the end of 1553 almost all those in Leinster, most of those in Munster, and some in Connaught and been suppressed. In Ulster and in remote parts of Connaught and Munster, however, monasteries continued to exist however, monasteries continued to exist till the early seventeenth contury. The pretext advanced for the suppression was that they were the abodes of idolatry and superstition, whereas, in fact, the religious houses of I. had performed a number of indispensable social services for the people, including education and hospitals. The dissolution was accompanied, in cases, by violence and bloodshed and many religious suffered imprisonment and even death for their refusal to adhere to the doctrine of the royal supremacy. In 1639 another commission was set up to find and destroy rolles and to transfer images and valuable ornaments, such as golden chaltoes, to the king's use. Browne then tried to evangelise the more distant parts of his archdiocese, and in the result the Irish privy council asserted that 8 bishops and

2 archbishops came before them in Clon-2 arcanisapps came before them in Clon-mel to take the required oath. But of bishops of papal creation, only 5 'con-formed' and these were deposed for heresy by the Pope. Of the lower clorgy few within the Pale took the supremacy oath and scarcely any outside it. wardly I. might conform to the reformed doctrines, but at this period it was the practice in the country to enter into ongagements without any intention of carrying them out When Mary d Elizabeth, a champion

of the Retormation, but one devoid of religious /oul, intended that the State Church of England should vereis sway over I too. In 1566 she directed the Irish Parliament to pass two important Acts the Act of Supremacy, declaring her supreme governor, both in eccles and spiritual and in temperal matters, and denving Papal jurisdiction, and the Act of Uniformity requiring the use of a Reformed Prayer Book at public worship But this religious less lation was far from being strictly enforced anywhere in I and in a great part of the country it was in possible to enforce it. Even where the authority of the Eng gov was effective the queen was careful not to provoke hostility or even tabellion by two great But this moderation was not Heverity severity. But this moderation was not due either to humanity or to we akness on her part. Throughout her reign she directed her Irish policy to the political subjugation of I and its reduction to uniformity with England not only in religion, but also in speech and social customs. Resistance to this policy led to persecution of the Catholies. The realisation, at length, in I that the Reformed doctrines were closely linked with the unposition of foreign rule proved. in the imposition of foreign rule proved, in deed, to be a cohesive influence among the people, who hitherto, far from reveal ing that love of country as a whole which to day is styled Nationalism, had fought and died mainly in the interests of clan conflict But now, under the good of foreign rule, a broader patriotism grew up through the stimulus of the threat to Catholicism Elizabeth found, therefore, in I for her religious policy many realous adversaries, while her supporters num-bened only the few, whose private interests in the than zeal for the polity, induced then to conform. The bishops and priests who refused the Oath of Supremacy were generally deprived of their sees and livings and superseded by Englishmon or Irishmen of more plant dispositions. But the wretched stipends of the sees and livings were not likely to attract men who could hope for eccles preferment in their own country. In consequence the churches were neglected and suffered to fall into rules, and in many places no pero-chal duty was done. In the parts of the country, however, where the authority of the ling gov. was as yet only nominal, conditions were better, especially before the Desmond insurrection had devastated the S. and the O'Nelli wars ruined the

prosperity of Ulster.
With the accession of Queen Elizabeth the State Church was restored in I., but the most noteworthy events in Irish hist. during this period are the O'Neill and later the Geraldine rebellions. Shane O'Neill had been elected chieftain by his O'Neill nad been elected chiertain by mistribe and claimed the earlier of Tyrons, which had passed to a hastard brother, Brian O'Neill. The Eng. supported the claim of Brian, but Shane was able to keep up a continual contest with the crown

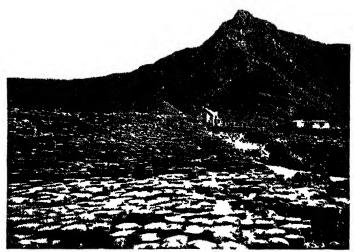

untit finally, in 1567, he was killed.

The crushing of the Shane O'Neill rebellion was followed in I. by a great religious revival. The counter Reforma-Catholicism on the Continent, worked with tremendous rapidity in I., influenced and helped to a very great extent by Jesuit priests. The immediate outcome of this religious revival was the Geraldine rebelilons. The second of these led by earl Dismond, was only put down after four years' continual struggle. The Irish were helped during this period (1579-83) by the Spaniards and the Its., and were crushed finally with great cruelty. The rebellion had been practically confined to Munster, which was finally subdued by huge con-ilscations and Eng. settlements; amongst the settlers were the poet Spenser and the adventurer Raleg' The final rebellion adventurer Rais. The final receilion during Queen Mirab.th's reign broke out in 1595 under O'Neill, earl of Tyrone. Essex, sent to quell it, made terms with leader and returned home; but Mountjoy, by means of a saries of fortresses from which he ravaged and laid waste the land, which he ravaged and had waste the land, thatly conquered it (1603). Tyrone admitted defeat, and was allowed to keep his lands and title. The wars in I. had of a necessity been barbarous once, both because the Eng. unjustifiably regarded the frish as savages and also because I. was struggling for all that England hold in greatest hate—Catholicism and the friend-ship of Spain. The atrectics of the time, equally ferocious on both sides, cannot be palliated, but are perhaps more easily understood. The system of plantations was developed during the reign of James I. The lands of the earls of Tyrone and Tyronnel were confiscated, and Ulster was settled chiefly with Pre-hyterians, although lands were also granted to the city of London. The administration of Strafford is the most important event of the early part of Charles I.'s reign. He promoted industry, law, and order; he restored the country to something approaching prosperity, but his order was the order of repression, his discipline the discipline of the iron hand. His worst and most unjust work was the attempt to 'settle' Connaught, but before he could carry out that work he was recalled to help Charles in England (1640). The great Irish rebellion broke out in 1641, inspired both by hatred of the rule of Strafford and with the first of what would have no under help Charles in England (1640). The groat capitulation of Limerick had, in addition to his in the service of the rule of Strafford and by the fear of what would happen under Puritan rule. Undoubtedly thousands of Protestants perished, although in a number of cases the figures have been grossly parliament did not recognise this latter exaggerated. The situation was complicated by the outbreak of civil war in England, and the Irish sent some help to the king, who was continually intriguing any ownership of property. The gov, of with them. In 1649 the execution of the

king released the parl. troops for service in I., where the young king, Charles II., had been immediately recognised. The methods of Cromwell and Ireton were thorough, and the Irish were crushed altogether. The garrisons of Wexford and Drogheda were massacred, and every priest that the Puritans found was indispriest that the Puritans found was indis-criminately slaughtered. The Cronwell-ian settlement followed, and huge tracts of land were confiscated. The only ments of Cromwellian rule were the res-foration of order and the prosperity which followed a peace of desolation. The Catholic roligion was, however, sternly repressed. The Restoration involved the settling of another great land question. The Cromwellian settlement was to a great extent unset, the original owners were extent upset, the original owners were restored, and the Cromwellian settlers given compensation in Connaught. The thon Catholic religion was also given a certain amount of toleration, and for the greater part of the reign Ormonde ruled I. for the Eng. king. The country was on the whole peaceful, but the trade restrictions imposed were rapidly alienating the Irish people still further, and were the grane of considerable traphs at a later cause of considerable trouble at a later period.

The revolution of 1688 was the immediate such for the outbreak of hostilities bethe skill for the outsides in meetings in twen the Catholics and Protestants of the N. of f. Londonderry and Enniskillen were immediately besieged, and the Protestants found themsevies hard set to hold their own. Londonderry remained uncaptured, whilst the besieged in Ennis-killen broke at and won a victory at Newtown Butler. The siege of London derry is memorable for the valour of its mable, who held out for nearly four months, repelling every attack and sufferme extreme privation and, at the end, stark famine (having eaten all the horses, cars, dogs, rats, nice, tallow, and starch in the tn.) when some Eng. ships broke through the obstructions of the riv. and so thread the siege and saved the in. Much of the credit for this intorio defence was due to a clergyman named George Walker, who had raised a regiment in the Protest. who had raised a regiment in the Protestant cause. In 1690 was fought the battle ant cause. In 1690 was fought the battle of the Boyne, after which lames II. left the country and returned to France. Wm. 111. also returned to England, and the Irah rebellion was crushed by John Churchill, duke of Marlborough, assisted by Ginkell, one of Win's Dutch generals. Cook and Kinsale fell Aghrim was won, and finally Spraffeld after a magnificent. and smally Sarsfield, after a magnificent defence, surrendered Limerick, and returned to France with his followers to tound the famous 11th brigades. The capitulation of Limerick had, in addition oligarchy The great landowners were blessing of the age The United Irishmen never in the country and their representatives treated the Irish peasantry with which he could not fulfil—Catholic eman the utmost cruelty Parliament was in the hands of the great Protestant families and the Church under the control of absentee and usually irrelations bishops. The Irish people were downtrodden, their trade repressed and their land taken from them. Thousands of them emigrated and

cipation—and finally the state of 1 became anarchic the United Irishmen were sternly represed and disarmed Ulster underwent a brutal persecution at the hands of an armed force but was finally disarmed. In 1796 the Fr invasion under Hoche had fulled at Bantry Bay In 1798 the flower of the link nation served the the frish rebellion broke out. It agreest enemies of Fagland since England to extentit was a national rising. The leaders tused to use their services. Towards the held out for Catholic eman ipation and

I rush hadu ivs

THL GIANT 9 CAUSEWAY, CO ANTRIVI

end of the century, however, Catholic | parl reform, and the peasantry were fight repression was lightened, and sov con | ing for separation from Great Britain repression was lightened, and soy concessions in the matter of ownership of land were allowed them These reforms were the immediate outcome of the Amer War of Independence I had to be better treated or there was the Jossibility of her also breaking away The prin result of this wer however, was the granting of an independent parliament. The light troops had perforce been withdrawn from
I. for service in America Ir invasion
seemed imminent The Irish Protestant and Catholic alike, formed a volunteer force to resist invasion I hen gradually they discovered their own power led by Henry Grattan and practically under the threat of rebellion they obtained the repeal

The buttles of New Ross and Vinegar Hill were the only two engagements of import ance and both were defeats for the rebuls The Ir landing was a failure, since it came too lute and Pitt saw that only union could end such anarchy But union was distrusted and disliked. It was only at enormous expense and after much bribery by means of honours that it was brought about Grattan ever a patriot, spoke strongly against it In 1800, however, the Act of Union was passed and in 1801 it be came law | the Irish were to be represent ed in parliament by twenty eight Irish peers and four bishops elected for life by the whole of the Irish pecrage One hun of Poyning's law after trade restrictions had been withdrawn (1782)

The next important event was the French Revolution, which Catholic and Protestant alike hailed as the greatest

Britain, and was to keep her judicial and executive systems. Pitt intended the Act of Union to be accompanied by a measure of Catholic emancipation, but the king (George III.) pleaded his coronation oath and refused to hear of it. Finally, rather than break a pledge, understood if not definitely given, Pitt resigned (1801). Rom. Catholics were unable to sit in the House of Commons until 1829, when the Rom. Catholic Emancipation Act was passed permitting them to do so. O'Connell was the great Irish leader of this time. In 1846 the potato crop failed, and famine made conditions terrible in I. About this time I. also began to feel Amer. competition in the corn market. Great Britain adopted Free Trade, and I., with the loss of protection for her wheat, soon found it impossible to compete with America. Measures were introduced attempting to alleviate the suffering of the smallholders, who, in many cases, were evicted by the impoverished land owners, and thousands of Iri-hmen emigrated to the U.S.A. and Canada. From 1864 to 1911, I. may be seen to change from a land of tillage to one of pasturage. The political inrest was aggravated during these years by the land question. Gladstone brought forward in Parls ment two Home Rule Bills, one in 1986 and the other in 1893, but both were rejected. The work of the but both were rejected. The work of the Irish leader Parnell (q.v.) in consolidating the Irish Home Rule party deserves notice during this period. Again, sev. years later, the Liberal party under Asquith inlater, the Liberal party under Asquith introduced a Bill for Home Rule for L, and in 1914 this Bill received the Royal Assent. But owing to the Great War the operation of the Act was suspended (see Home Rule). During the First World War many Irishmen volunteered and fought for Great Britain, and John Redmond, the Irish leader, used all his influence to assist the Brit. cause. But trouble between the two countries was still brewing. In 1916 there was a rising in Dublin, and after the war and the in Dublin, and after the war and the death of John Redmond matters grew worse. Secret societies and societies which were perfectly open in their proceedings strove more and more to separate ceedings strove more and more to separate
I. from Great Britain. In 1919 an Irish
Republic was set up with its own parliament, the first Dail. In 1920 guerilla warfare began in I between I. and Great
Britain, and a system of reprisals resulted, which was ended by a truce in 1921. In that year a N. I Parliament was set up in Ulster and later in the year a treaty between Great Britain and I. was signed. In 1922 the Irish Free State was formerly inaugurated. For subsequent bist., sec KIRE: and see also GREAT BRITAIN and

IRELAND, NORTHERN.

Irish Lilerature.—I., more than any other country in W. Europe, possesses a vast mass of poetry and saga, existing in MS., much of which has not yet been catalogued, but this is no doubt only a fragment of the whole of anct. Irish literature. The poet Senchan Torpelst, in the Book of Leinster, a.D. 1130, laments that the Cattle Raid of Cooley and the Great Skin Book had been taken to the E., and in many other of these anct. MSS., are similar

references to books that have disappeared. Prior to the writing of MSS., there existed in I. the bardic schools of poetry and, at a later date, the Christian colleges. We find in the many lives of the saints references to these Christian colleges, but little is known of the bardic schools. It is supis known of the bardic schools. posed that they were formed round a chosen bardle poet, who was followed from place to place by his disciples. The earliest extant MSS, written in Old Irish date from the eighth century, and are mostly glosses and explanations of book used in Itish church schools. Other Gaelic works in order of antiquity are the Hook of Armagh, poems contained in the Milan and the St. Gall codices, and the Martyrology of Angus the Culdee. Later, from the twelfth to the sixteenth contury, follow the books of the Middle Irish period, which includes the Book of Leinser and the Book of Ulster containing the Callle Raid of Cooley. The Middle Irish books, however, were compiled from poemy and, sagas of a much carller date. As Irish literature developed, it con-centrated on the writing of romances, and, unlike other Celtic literature, no and, unlike other Celtic literature, no drama was produced. Stories of cattle raids, batrles, courtships, voyages, visions, destructions of places by sword and tempest are the subjects of epic and romance in prose and poetry, which formed the repertoire of the ollamh or chief bard. To learn his craft took the bard from nine to twelve years. The introduction of Christianity had little influence on the early romances, which may be divided into the following mythological cycles: the Cycle of Tuatha De Danana and the Pre-Milesians, the Red Branch Cycle, and the Cycles of Finn Nac Cumball, Ossian, and Oscar. These romances date from before the eighth century. Following the Norse invasions of the ninth and tenth centuries, literature and art were blotted out, but in the eleventh and twelfth centuries there was a revival in art and learning. It was during this time that the Middle Irish books were ompiled, but, owing to Norman interference, the thirteenth century was comparatively barren. The most important poet of this period was the bard Donoch i Mor O'Daly (d 1211), but there are few poets men-tioned who belong to this time, and not many poems are extant. During the four-teenth century poetry again flourished, the most important poets being Tadg Mor O'Higinn (d. 1315) and John Mor O'Dugan (d 1372). From this time date the compilations of annals and family records, pulations of annais and manny records, and the profession of neetry became hereditary, noteworthy families being the O'Dalys and the O'Higinus. Fergal O'Dalys and Angus O'Daly, the satirist, Tadg Og O'Higinu and Dubhthach, son of lochadh, are celebrated poets of the fifteenth and sixteenth centuries. With the eventeenth century came a revival of Irish literature under the four masters, Seathrun Keating, Father Francis O'Mul-loy, Lughaidh O'Clery, and Duald. These four men were poets, while Mac Firbls was the greatest prose-writer of that time. A later poet was Teig Mao Dairo, but with

the eighteenth century came the downfall I have ab indoned the peasant-life comedy of of the ollamhs, and their poetry became inbued with melancholy, for they were reduced to poverty and found it impossible even to educate themselves. The sor rows of the ollambs are well expressed in the prolife works of David O Bruadar, who is a typical poet of this period. During the end of the nineteenth and the begin ning of the twentieth century there was a revival of the Irish language and its literature, and (isolio became the official lan guage of Erre Also many Insh dramat ists, writing in Eng , have used the and Irish myths

The Irish contribution to Eng litera The trish contribution to king literature has been peculiarly rich in drams, perhaps the most fertile field, Goldsnuth, Congreve and Farquhar, Wilde, Shaw, and O'Casey, in poetry Thomas Moore and Yeats in philosophy William Rowan Hamilton and A E (George Russell) in novel writing, Lover and Lever and in England, James Joyce During the past country of a century this convenient of a century this convenient. quarter of a century this entichment of English by writers of frish extraction has continued These years have seen the achievement by Eire of independence, a decline in the heroic mood and the rise, of a new middle class of traders and civil servants, and it is against this background, with its inevitable disenchantments that movelist critics such as Frank O Counor and Sean O'Paolain have written in the past two decades while can o Casey, the playwright, has made interesting attempts at a fusion of a racy realism with symbolical significance Mary Layin with sev vole of short stories including Tales from Bective Bridge (1913, Fait Prize) and a novel, has been the sole reminder from a neutral Iroland that the standard of work in hetion set by Frank O'Connor and Sean O Faolain has not been lost Her stories have a singing quality, with prose heightened through local ideom to the musical form familiarised by J M Syngo Michael McLaverty's notion is drawn from his experience of the Rom Catholic people of Bill at and vicinity His last novel The Three Brothers (1918) in its even and lyrical prose, is typical of his exactness of vision. Bry in Mac Mahon of Kerry is a voing story teller whose Lion Famer and Ollier Stories (1918) reveals a talent developed in the tridi-tional stanachie manner Victael O'Beurie acutely pictures the lower middle class of Dublin Among poets there has been something in the nature of a reaction to Yeats, whose greatures has somewhat obscured their individuality. The Guelic obscured their individuality. The (hold influenced poets (writing in Lug.) include Austin (larke, Robert Farran Padraic Fallon and Donagh MacDonagh. 9 Irish poets using a more typically 'modern' idlom and more concerned with ideas, are Ewart Vilne, Valentin Itemonger and Geoffrey Laylor Ulster poets are John Hewitt and W.R. Rodgers whose concern is with the problems and way of twing of a distinctive community. cern is with the problems and way of living of a distinctive community in Irish drama, Lord and Lady Longford (of the Abbey Theatre), Teresa Deevy, Gerard Healey and Walter Macken are among a small group of playwights who

freland, Church in, was founded, according to tradition, by St. Pitrick, who has always been regarded as the patron saint of the country, in the fifth century. In the seventh and eighth centuries the Irish Church was one of the most flourishing in Christendom See IRFIAND—History Despite the outward continuity of the present Church of Ireland with the preof the Reformation Church, it has for centuries been the Church of only a section of the people of whom by far the larger portion remained under papal jurisdiction. The first envocation of the first clergy was held in the reign of Jimes I, the Irish actives held in the reign of Jimes I, the Irish actives helm grawn up in 1010. These wer accepted by the Irish Church in 1634. Their distinctly Calvinishe tone is indica. tive of the way in which the Church of Ireland has dways inclined more in the direction of the advanced reformers than has the Church of England During the sevent continuous transportant prelates were John Branchall, Archbishop of Armagh, Jeremy Taylor, Bishop of Down, and Wm King, Bishop of Derry. The Act of Union of 1800 linked the Churches of England and Ireland into the

'United Church of England and Ireland,' but the reformed doctrines made no progress. In 1833 the Church Temporalities Act abolished two of the four Irish archbishoprics and eight of the eighteen bishoprics. Finally, in 1869, a Bill for the discatab. of the Irish Church was passed on the introduction of Mr. Oladstone. Before the Act came into opera-tion (1871) a synod of the Irish Church was held which declared its adherence to the anct. constitutions of the Church, and since then no doctrinal or disciplinary changes of importance have been made. The Church of Ireland now his about 1500 clergy, and nearly 600,000 adherents. See clergy, and nearly 600,000 adherents. See R. Mant. History of the Church of Ireland, 1810; Leo's Irish Episcopal Succession; T. Olden, Church of Ireland, 1892; L. Gougaud, Christianity in Celtic Lands, 1932; W. Phillips, Church of Ireland from Earliest Times, 1933; M. V. Rouan, Reform in Ireland, 1936. Ireland Island, see BERMUDAS. Lesiand Northern were consisting of

Ireland, Northern, area consisting of Belfast and Londonderry and the cos. of Antrin, Armagh, Down, Fermausgh, Londonderry, and Tyrone. Its area is 5236 sq. m. and the pop. 1,279.745 (1937). When, by the *reaty of London, 1920,

which ended the war between England and Ireland, Ireland was offered dominion status (q.v.), Ulster or the Six Counties elected to remain within the United Kingdom of Great Britain and N. I. The dissociation of Ulster (q.v. and IRELAND History) or N. I. from the rest of Ireland goes back to the time of Henry VIII., when Protestant England installed Eng. and Scottish settlers in Ireland to work and own the land from which, in many

instances, the Irish had been dispossessed. A parliament, consisting of a senate of two ex officio senators and twenty-four sonators elected by the members of the House of Commons of N. I. on the pro-portional representation system and a House of Commons of fifty-two elected members was set up in 1920. The executive power is vested in the Governor on behalf of the king; he is appointed for

a term of six years but the appointment of the Duke of Abercorn (first appointed in 1922) has thruce been extended for a similar period. The Ulster parliament possessor governing powers within its own area, but lacks control of the military, the right to make treaties, and the authority Thus, in detail the matters ex to tax.

the U.K. are the province, not of the was manufact.
Commonwealth Relations Office (as are value of #6 in

those of Eire) but of the Home Office. N. I. counists of six cos. (for their pop. see table p. 586) and two co. hors, but the boundary between N. I. and Eire has boundary between N. 1. and rary need caused strained relations and, nuder the Finna Fail (q.v.) Gov. of Mr. de Valera, and its successor, the partition growance has become the dominant political issue in Eiro. By a treaty in 1925 the boundary and the finding of the contract of the cont ary was left as it was and the findings of a ary was left as it was and the findings of a commission (the Feetham Commission) were abandoned. Owing to the civil disturbances in Ireland a large police force was organised in N. I., and is still in existence, known as the Royal Ulster Constabiliary. Sir James Craig was elected to be the first Prime Minister, in 1921, and again in 1926 (see Crangayon, Viscount). N. I. has accepted the taxation imposed on that the Improved Constability. it by the Imperial Gov., the more willingly as it has generally been lower than that ovisting in the Irish Free State or Eire. More than two-thirds of the people of tister are devoted Brit, patriots and resent any proposal of union with Eire (or S. Ireland as Eire is often called, though in fact Eire comprises much more than S. Ireland). But for the pro-Erre minority living chiefly in Tyrone and Fermanagh and the possibility of civil disturbances between Ulstermen and the S. Irish, conscription might have been applied to N. I. during the Second World War. Considerable advantage, however, was gained from the fact that the bridgehead of N. I. re-mained unscathed throughout the war, during which a strong garrison of Amer. troops were landed and the fortifications were considerably strengthened despite

Mr de Valera's formal objection.
The prin. industries of N. I. are agriculture, ship-building and repairing, engineering, flax-spinning and weaving, nen bleaching and finishing distilling (whiskey, etc.), linen embroidery, manuf. of taxtic machinery, fruit preserving, food caning, flour milling, air conditioning plant, aircraft, rope making, woolens and tweeds, hosiery and other clothing, tobacco, furniture, chemical manures, perambu-lators and toys, shirts and collar pottery, roofing folt, optical goods, matches, cement, plastic ware, leather and leather goods, and carpets. In summer months herring fishing and picklin, is an import-ant activity. Beltast is the leading industrial centre, and the linen industry gives employment to over 70,000 persons (excluding those engaged in growing the fibre)

oluded from its authority as being matters of imperial concern, are the Crown making of peace or war, military, naval and air force, treaties, titles of honour, naturalisation, domicile, external trade, submarino cables, wireless telegraphy, aerial navigation, lighthouses, coinago, trade marks, etc.; also certain matters reserved to the Imperial Parliament manely, postal service, Post Office and Trustee savings banks, designs for stamps, and registration of deeds. N. I. is, indeed, 25,000 loor for all practical purposes a part of the United Kingdom, returning twelve mombers to Westminster, while relations with the U.K. are the province, not of the Commence of the Commence of the control of the Commence of the

workers in the clothing and textile trades in 1947. Londonderry is an old estab. centre of the shirt-making industry. The only minerals are sandstone, clay, chalk, or other igneous rocks, and granite, the quarrying of which employs some 3000 persons. In 1946 there were some 1663 elementary schools with 185,600 pupils; and 76 presenters in temperature. elemontary schools with 185,600 pupils; and 76 preparatory, intermediate, and secondary chools with nearly 20,000 pupils. The Queen's Univ. Belfast, has some 2000 students. The revenue of N. I. in 1945-46 was £51,216,000 and the expenditure was much the same. The total

I LAX HARVESTING IN NORTHERN IRELAND

The flax is put into the retting dam where it will steep for about ten days

railway mileage is 677, the chief railways being the Great Northern, L. M and S. (N. Cos. Committee), Belfast and County Down, and Londonderry and Lough Swilly. Air services are in operation between N. I. and the prin. airports of Britain. Although economically N. I. is allied to England, much of the pop. is of the peasant proprietor type common to the whole of Ireland; in 1937 the total pop. was 1,279,745.

In According to the census of 1937, the off owing are the areas and pop. of the cord and co. bors. of N. I. The names of amora aps. appear in parenthesis:—

Irenseus, Saint (c. 120-202), bishop of Lyons at the end of the second century, said to have been a native of Sinyrna, Asia Minor. In early youth he seems to have been connected with Polycarp. He was a priest of the church at Lyons under Pothinus, its bishop, upon whose martyrdom, in 177, in the persecutions of Marcus Aurelius, I. succeeded to the bishopric, which he held for twenty-five years. He spent great labour upon missionary efforts among the pagen Gauls, but he is best known for his attempts to mediate be-tween the bishop of Rome and the Christian churches in Asia Minor in their dispute about the proper day for the celebra-tion of Easter, and for his opposition to the Gnostics and the Valentinians. The account of his martyrdom under Severus is not found before the writings of Greg-ory of Tours, and is probably a mistake. Of his writings, a few fragments of the Ad-Of his writings, a few fragments of the Adrersus Hiereses, in the original GL, and a barbarous Lat. trans. of it are all that are extant. See editious of his works by Frasmus, 1526; A. Stieren, 1818-53; W. W. Harvey, 1857; and in Clark's Anto-Nicene Library; and Le P. Salvator Herrera, St. Irinee de Lyun exigeté, 1920; L. Spikowski, La Doctrine de l'église dans St. Irênée, 1926; S. Lundström, Studien zur lateinischen Irenaus Überschzung, 1913

Irene: (1) (c. 752-802), Byzantine em-Press. she was a poor but beautiful and talented orphan, a native of Athens, whom Leo IV., E. Rom. emperor, married in 769. On the death of Leo (780) she ruled over the empire, her son, Constantine VI., being only ten years of age. She restored the orthodox image-worship, for which deed she was canonised by the Gk. Church after her death. When Constantine grew up he trad to free himself of her autocratic sway, and in 790 was proclaimed sole ruler by the soldiers. Two years later the empress compared against her son, and had his eyes put out. She tried to arrange a marriage between herself and Charlemagne. In 802 she was banished by the patricians to Lesbos, Nicephorus, her treasurer, being placed on the throne. (2) A Rom. god-dess of Peace, according to Hesiod a daughter of Zeus and Themis. Sho was worshipped at Rome and at Athens.

Ireton, Henry (1611-51), Parliamentarian general, b. at Altenborough, Notts; graduated at Cambridge Univ., 1629, and studied law. Married Cromwell's daughter, Bridget, and acquired great influence in the Parliamentarian party. Took an active part in the Civil War, on the outbreak of which in 1612 he was nominated break of whitch in 1612 he was nonmanear captain of a troop of horse to be ruised at Nottingham, near which in, his estates were situated. He fought at Edgehill and at Nasoby, and was present at the siege of Bristol. He signed the warrant for the execution of Charles I. In 1649 he went to Ireland as Cromwoll's deputy, and rendered vectors as service to his party. He dered yeoman service to his party. He died of fever when besieging Limerick.

Iria, see Voghera.

Iriarte, Tomás de (1750-91), Sp. poet, b.
at Orotava in Tenerifie. He began his at Orotava in Tenerifie. He began his literary career by the trans. of Er. plays, publishing his first original comedy, Hacer que hacemos, in 1770. In 1771 he became official translator in the foreign office at Madrid, and in 1776 keeper of the records in the War Office. A dull didactic poein, La Musica (1780, Eng. trans., 1807), inspired by Haydin variouch admired, but his fame resis manniven his habites. his fame rests mainly on his Fabulas Laterarias (1782, Eng. trans., 1806), two of which, The Donkey Flautist and The Duncing Bear, are especially celebrated. See E. Cotarelo y Mori, Iriarte y su épora, 1897

Iridacese, natural order of monocoty-ledonous plants, consisting of nearly 1000 species, which flourish in temperate and tropical lands. They are usually her-baceous plants of such beauty as to justify their cultivation for ornament alone. The their cultivation for ornament alone. The fris (q.v.) and Crocus (q.v.) are repre-sentatives of the predominant northern form of this order, as the Gladiolus, Freesia, and Isia are of the southern. Iridium, one of the metals of the plat-

iridium, one of the metals of the platinum group. Its symbol is Ir, its atomic number 77, and its atomic weight 193 1 1. occurs as an alloy of platinum, and also of osmium in the Urals, Brazil, and elsewhere. It is fusible only with difficulty, extremely insoluble (in the massive form it is not attacked by aqua regia), and separable from its allied elements only with difficulty. The best method for its preparation is that devised by St. Claice separable from its allied elements only with difficulty. The best method for its preparation is that devised by St. Claire Deville and Dobray. This consists in fusing comiridium with zinc, distilling off the latter so as to leave a porous mass. This is powdered, mixed with barium nitrate, and ignited. The comium is converted into barium comate, and the line. verted into barium osmate, and the l. into its oxide. On boiling with nitric acid the osmium is volatilised as the tetroxide, while the L is obtained in solution from which the double amnonium chloride can be prepared. This, on ignition, gives I. in a spongy form, which, on fusion with lead and subsequent treatment with nitric acid, gives the pure metal. I. is used for pointing gold pen-nibs, for electrical spark-ing contacts, and for making standard measures. Its compounds resemble those of platinum (q.v.).

fridosmine, see OSMIRIDIUM.

Iriga, tn. of the prov. of Ambos Camarines, Luzon, Philippine Is., on the Bull R. The chief products are rice, Indian corn, sugar, pepper, cacao, cotton, tolacco, copra, and hard woods. Pop. 90 000

Iris, in Gk. mythology, was the daughter of Thaumas and Electra, and the sister of the Harpies. In the Iliad she is mentioned as the messenger of the gods, but the office is given to Hermes in the Odyssey. In earlier writers she in mentoned as a virgin goddess with wings of gold, but later writers make her the wife of Zephyrus, and the nother of Eros. She was especially considered the messenger of Hera and Zeus, and is depleted with a herald's wand, and a pitcher in her hand. In Gk, the word 'iris' denotes 'a rainbow,' of which she is generally considered

Iris, one of the larger of the asteroids, planatolds, or minor planets, a group of small planetary bodies between Mars and Jupiter, first discovered in 1801 and 1802.

See ASPEROIDS.

the personification.

Iris, chief genus of Iridaceae. There are many sections of the I. family, but the family may be divided into two main sections—the species and the tall-barded varieties. The species are the wild irises, most of them small-flowered, which have been found growing throughout the N. been found growing throughout the N. hemisphere—California, Morocco, Transfordan, Persia, China and many other places including Britain. As far as species are concerned there are about 200 different types, some grown from bulbs, some from roots, and others from ritzomes. Seven aspecies are easy to obtain and grow. These are I. reticulata, with fragent and valuat flower does obtain and grow. These are *I. reticulata*, with fragrant and velvety flowers, deep volet in colour; *I. stylosa*, the ideal plant, which blooms all the winter with blue flowers excellent for cutting; Sp. and Dutch irises, both Junc-flowering types, which grow readily in any normal soil; Siberian irises with attractive flowers in violet, white and blue colours; *Kampferi* or Jap. 1., with broad that blue purple or white flowers; and *I. ch inaeris*, a small, low-growing counterpact of the a small, low-growing counterpart of the tail-bearded varieties, useful for rock-garden or border. In the tail-bearded section the only I. known to many gar-deners is the purplish-blue variety known as Germanica. The well-known species of I are known popularly by the names of fleur-de-lis, flowers-h-luce and flags. Among the best-known species which are Among the best-known species which are to be found in Britain are the *I. pseuda-corus*, the yellow flag, and *I. foetidissima*, the gladwyn or blue *I. I. foetidissima*, the gladwyn or blue *I. I. foetidissima*, the Florentine *I.*, is a native of S. Europe and the is. of the Mediterranean; its rhizome has an aromatic edeur like that of the sielet, and is known as orris-root. The violet, and is known as orris-root. The Algerian I., which has large blue-purple blooms, is one of the best of all winter

looms, is one of the best of all winter flowers and will grow in a poor soil.

Irish Free State. The name given to S. Ireland by the Irish Free State (Agreement) Act, 1922, which repealed the Gov. of Ireland Act of 1920 (Home Rule) and created a dominion in Ireland on the Canadian model. Under Mr. de Valera's

Irish Fusiliers (Princess Victoria's), The Royal. Formerly the 87th and 89th Regiments. The 87th was formed in 1793, and fought under Abercrombio in Egypt in 1801. It gained great fame as the 'Faugh-u-Ballaghs' (Clear the Ways) in the Peninsula, where Sergeant Masterson of the regiment cantured the first son of the regiment captured the first Fr. Eagle during the campaign. It then took part in the Crimean War, the 1882 took part in the Crimean war, the 1802 Egyptian campaign, and the Burmese War of 1885. The R.1.F. took part in the South African War (1899–1902), and was at the Relef of Ladysmith. During the First World War it raised fourteen battalions, which fought in France, Flanders, Macedonia, Gallipoli, and Palestine. After the war it was reduced to one battalion, and linked with the Royal Inniskilling Fusiliers to form one corps. In the Second World War the regiment was part of the famous Eighth Army and fought in many battles on the It. front. Detachments of the regiment also formed part of the Brit. garrison in Leros.

Irish Guards. Formed in 1900 to commemorate the gallantry of Irish regiments during the S. African War, 1899–1902. It was formed from volunteers from other regiments of Foot Guards. During the First World War it raised three battalions First World War it raised three nattaines which served in France and Flauders, bearing the following honours, among others, on its colours—Mons, Marne, Ypres, Gheluvet, Loos, Somme, Passchendaole, Cambral, Bapaume, Hindenburg Line, and Sambre. General the Earl of Cavan is Colonel of the Regiment and King George VI. is its Colonel-in-Chief. In the Second World War the I. G. fought in numerous hattles in Italy and on the W. Front. battles in Italy and on the W. Front.
'Irish Independent,' founded in 1891 as a

penny daily newspaper, the I. I. (now pub. at 14d.) has the largest circulation of any daily paper in Eirc. It is a strong supporter of the Fianna Fail party, and is active in upholding the revival of the Gaelio language—but evidently without much success—and in promoting the Irish arts and industries. The I. I., together with its satellite papers, the Evening Herald and the Sunday Independent, takes

Heraid and the Sunday Independent, takes a great interest in all sporting events. Irish Moss, see CARRAGEEN MOSS. Irish Nationalist Party, see NATIONALIST. Irish Press, organ of the Flanna Fall (q.v.) party in Eire. Founded in 1931, as an Irish National paper, but was subsidised mainly by disaffected Irish Americans. It is the organ of the present (1947) Eire Gov. and has no sympathy with the Brit. Commonwealth.

the Brit. Commonwealth.

Irish Regiment, The Royal. Formed from certain Independent Companies which were regimented in 1683. It fought at the Boyne and at Limerick under Wm. 112. It greatly distinguished is the fail of Namur in 1695, where its conduct gained from Win. III. the grant of one of his own badges, the Lion of Nassau. It fought under Mariborough at Bleahelm, etc., and under Abercromble at Alexandria in 1801. It took part in the

Gov. the name was changed to Eire. See New Zealand (1881), and Egypt (1882) campaigns, and was at Tel-el-Kebir. It is Fusiliers (Princess Victoria's), The Royal. Formerly the 87th and 89th 1902. In the First World War it raised nine battalions, which served in France, Flanders, Macedonia, Gallipoli, and Pales-As a consequence of the inauguration of the Irish Free State the regiment was disbanded in July 1922.

irish Republican Army (I.R.A.), illegal association of Irish extremists, who stand for a republic of all-Ireland, entirely independent of the Brit. connection. They independent of the Brit. connection. They are the successors of those members of the S. Irish Volunteers who refused to light for the Allies in 1914 and who formed themselves into the Irish Republican Volunteers, organised the Easter Week Itising in 1916, and proclaimed an 'Irish Republic.' More extreme than the Sinn Feiners, they rejected the Anglo-Irish Treatv of 1921, and in 1922 involved their country in a second civil war. They numbered probably about 25,000 in the time of the Fine Gael (Cosgrave) Gov., but dwindled to less than 10,000 in the course of the Finana Fail (q.v.) rule of de Valera. Like the I.R.A., Mr. de Valera, when Prime Minister, aimed at the abolition of the border, but whereas he pretion of the border, but whereas he preserved some kind of external association with Britain, the I.R.A. wanted absolute independence, and to that end they organised a series of bomb explosions in Great Britain—probably in conjunction with Nazi agents—but after the passing of the Provention of Violence (Temporary Measures) Act, 1939 to expedite legal pro-cedure against the malefactors, considerable numbers of the I.R.A. members were deported to Erre and one or two were hanged for murder. In Erre in Dec. 1940 they raided the Phienix Park Arsenal and stole large quantities of arms and ammunition, whereupon the Dall passed an emergency act authorising the gov. to intern suspects. Early in his tenure of office do Valera had proscribed all pseudo-military bodies, such as the Blue Shirts, and it might have been supposed that the Act was sufficient for the purpose of rounding up the I.R.A., but in Eire it is difficult to secure a conviction, juries being either sympathetic to the suspect of afraid of the I.R.A. The I.R.A. has no official organi-

A. The I.R.A. has no omean organi-sation, only ventures to meet in secret, and is governed by an 'Army Council.' Insh Rifles, The Royal (now The Royal Ulster Rifles). Formerly the 83rd and 86th Regiments, which were linked in 1881. The 83rd was raised in 1793, and gained its first honours under Wellington in the Penninsula. It then saw service at the Cape, in Ceylon, and America. During the Indian Mutiny it served in Central India. The 86th was originally employed as Marines, but in 1799 went to India, where it served with distinction at Bhurtwhich it served with distinction at Haur-pore (1805). During the Indian Muthry it served in Central India, and later at the Cupe. The R.I.R. went through the S. African War, 1899–1902. During the First World War it raised twenty-one bat-talions, which served in France, Flanders. Alexandria in 1801. It took part in the Macrdonia, Gallipoli, and Palestine. In Crimea (1853-56), Afghanistan (1879-80), consequence of the inauguration of the Irish Free State its title was altered from The Royal Irish Rifles to The Royal Ulster Rifles.

Irish Sea, sea which lies between the N. of England and the N. of Iroland, con-nected with the Atlantic on the N. by the N. Channel, and on the S. by St. George's Channel. The greatest breadth (between Morecambe Bay, Lancashire, and Dundalk Bay, Louth) is 150 m.; the greatest length is about 110 m. Within its boundaries are the Isles of Man, Anglesey, and Holyhead.

Irish Setter, sec SETTER.

Irish Terrier, rather large dog, varying

duce it. The old I. Ws. enjoyed a great reputation for their strength and their courage in attacking wolves. In appearance they seem to have been of two kinds. one resembling a greyhound, and the other a mastiff. Modern I. Ws. are the result of the endeavours of Capt. Graham of lursely, Gloncostershire, to reproduce the old breed, but there is no positive proof that they do so. They are the result of crossing the Great Dane and deerhound, but a fine specimen exhibited in 189; was the result of crossing a bitch, of Scottish hounds strain with a dash of Siberian wolf strain, with a Russian wolf-

IRISH TERRIER

T. Fall

IRISH WOLFHOUND

in weight from 17 to 25 lb.; with a hard, rough, and wiry coat, without any tendency to curl. Its usual colour is a bright reddish-brown, but varies through different shades of brown. Its hoad should be long and rather narrow; the ears small. oe long and rather narrow; the ears small filbort-shaped, and lying close to the head; the eyes small and bazel, and the now black; the fore legs straight and strong with round thick foet; chest narrow with deep brisket, and back straight and strong; the tail, if not cut, should curve. The I. T. is quite a modern breed, dating from about 1970; it is much valued for its affection and pluck, and its enthusiasm

for chasing anything and everything.

Irish Times,' constitutional daily paper pub. in Dublin and widely cheulated throughout Ireland at the price of 2d. Originally a penny newspaper, it was founded by Major Lawrence Knox as and anti-Homo Rule, anti-Catholic, and loyalist paper of a very pronounced type. In contrast to the Irish Press it stood for the maintenance of Iroland's place in the Brit. Commonwealth of Nations. The paper was purchased in 1873 by Sir John Arnott. The I. T. company also publishes in Dublin an Evening and a Weekly

usnes in thinnian meaning and a Weekly ed. of the L. T., and the Irish Field, a paper devoted to every kind of sport. Irish Water Spaniel, see Spaniel. Irish Wollhound, supposed to be the oldest breed of dog in the United King dom, but the original breed in reality has died out and information to unwestignt.

The I oints of this modern breed hound. as required by the Irish Wolfhound Club standard, are: general appearance not quite so mussive as the Great Pane, but more so than the deerhound, the largest hunting dogs in existence, with minimum height of 31 in. and weight of 120 lb. (bitches 28 in. and 90 lb.); head long and narrow, muzzle long and moderately pented, and ears small, and greshoundhke in carriago; neck long, very strong and nuscular, well arched will out dew-lap, chest very deep and breast wide; back moderately long; lone arched; beht well drawn up; tail b ng and slightly curved, of moderate thickness and well covered with hair; shoulders muscular and sloping; elbows well under; mus-cular thighs with second thigh long and strong, and hocks well let down; feet moderately large and round with toes well arched; hair rough and hard on body any colour that appears in the deerhound but black is rare.

Inus, inflammation of the eye, in particalur of that coloured membrane called the iris which lies between the cornes and the lens. I. is usually associated with some constitutional aisturbance, such as nout, rheumatism, syphilis, or tuber-culosis; it may be secondary to inflammation of the cornen or of the sciencite or choroid coats. It is sometimes symptomatic of meningitis. The symptoms are dom, but the original breed in reality has did out, and information concerning it is only obtainable by tradition, although dread of light and the shedding of copious sev. attempts have been made to reprotect the art. The physiological changes include an excess of blood at the beginning of the attack, followed by exudation into the fibrous substance of the iris, possible adhesions to the lens or collections of pus between the lens and the iris. The attack may be the substant of the state of the substant of the substa may subside in about six weeks, it may may subside in about six weeks, it may become chrome, or it may take on a recurrent form Generally, rest for the eve is of prime importance; the eye should be shaded and no occupation requiring its constant use should be permitted; the patient should not, for instance, read at all Pain may be alleviated by hot formentations or the administration of cocaine It has been found that adhesions may be treated with success by the use of electrolytic methods

Baikal. Fishing in Lake Baikal and trapping for furs are the chief occupations outside agriculture. The climate is tions outside agniculture. The climate is severe and earthquakes common in the neighbourhood of Lake Baikal. The man hab are mostly Russians, Burists, and Tunguses. Area 280,429 sq. m. Pop \$21,000. The chief this are Irkutsk, Balagansk, Kirensk, and Verkholensk. (2) Cap of the E. Siberian Region, and a univ tn., lies on the Angara R. and on the Trans-Siberian railway, 40 m. N. of the Sextremity of Lake Balkal and 3722 m. from Lennigrad. The tn. was almost destroyed by fire in 1879, and has been rebuilt on a remarkably fine plan. It has many fine buildings, factories, and a gold. many tine buildings, factories, and a gold

Iron and Steel. Iron (Symbol Fe, atomic number 26, atomic weight 55: 85)

is the fourth most abundant element on the earth. It is only very rarely found in the free state, and then mostly as moteorites which have come from other worlds than ours. Its more usual occurrence is in combination with oxygen as oxides, or with sulphur as sulphides (pyrites). Only the former are true ores of tron, as the latter is infrequently used as a source of extraction of iron owing to the high sul-

phur content and difficulty of removal. Iron ore, as mined, contains varying quantities of impurities, such as silies, alumina, lime, sulphur, and phosphorus, which have to be removed, as well as the oxygen, be-

fore malleable steel or fron is produced. This is almost exclusively done by heat in generations,

onke, charcoal or other carbonaceous material. Terrestrial iron was known early in the prehistory of Mesopotamia and Asia Minor; iron forging was perhaps discovered in Armonia where there are rich ores. The process had spread to N. Europe by 500 B.c. The purposeful repetition gave the first ironmester of an industry which today produces well over 100,000,000 tons of steel annually. Prehistoric man used iron for tools, weapons, domestic and horsegear, and particularly for agric. implements such as hoes and sickles.

The primitive processes of working gave a pasty semi-solid malleable metallic product in one operation. The small pieces of iron, weighing only a pound or two at the most, could be hummered into shape with the tools of the early craftsmen. Owing to its extensive distribution throughout the world, iron manuf, was widely carried out. Improvement on the crude forging process, improvement on the crude lorging process, though slow, was definite, larger units were built, more powerful blowing machines were introduced, until about A.D. 1300–1400 an unexpected result was achieved. Instead of the partly malleable product, a liquid metal flowed from the furnace, which was achieved as actions to the furnace. which was found, on setting, to be hard and brittle. This substance we now know as pig iron, and the reason it is so hard and brittle is that it contains about 4 per cent of carbon whereas the prior malleable iron was practically carbon free. The expert ironnuster soon found a way out of the difficulty by a further treatment of the pig iron in a separate furnace and thus there was the beginning of the presentday double process for producing steel or malleable iron. The iron ore which conmalicable iron. The iron ore which contains about 30 per sent oxygen is heated in a blast furnace with coke to produce pig iron, which contains no oxygen but 4 per cent carbon, the balance being iron. The pig iron is then heated in a steelmaking furnace to roduce the carbon to from 0 02 to 1.6 per cent carbon, which is the range of steels from very soft to very bear. hard

Sources of Iron.—Although iron is widely distributed throughout the crust of the earth, the prin. ores from which it is extracted are comparatively few. extracted are comparatively few. Among the more important are (i) Magnetite (Fe₂O₄) containing 72·4 per cent iron; a black ore which, in line with its name, is very magnetic; (ii) Haematite (Fe₂O₄) containing 70 per cent iron; its colour varies from bluish-grey to red, and one well-known form is the so-called 'kidney ores' of Cumberland; (iii) Limonite (2he₂O₄3H₂O) containing 59·8 per cent iron, it colour varies from various shades of Among iron, it colour varies from various shades of brown to yellow; and (iv) Siderite (FeCO₂), also known as spathic fron ore; contains 48:3 per cent iron; its colour varies from pale yellow to brown and grey.

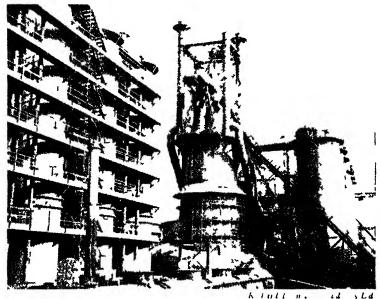

Pyrites (FeS.) is not really a source of iron as it contains too much sulphur to

allow a profitable extraction of iron from the raw material. It is a mineral which occurs widely and extensively throughout the earth's crust, but its development as a source of iron is a problem for future

EVOLUTION OF IRON AND STEEL MANU-TACTURE——In the Middle Ages pig from was produced in primitive black frunaces using the roal as fuel which was burned by an air black from bellows driven by water wheels the pig from was east into sand beds, allowed to go cold, broken up and then the second process of conversion to malleable metal was carried out in a separate furnace known as a charcoal refinery. One again the fuel used was charcoal, made by partial burning of wood with a controlled and limited acces

for production of wrought fron, but again only giving a semi solid spongy product. The blast furnaces of Darby's day in the late eightenth century had an output of 10 tons per week, which was considered colosed. Modern blast furnaces which have been diveloped from it have an output up to 1,000 tons per day.

I he major problems of steelmaking may be classified under two headings (1) heat, (2) is factory material able to resist heat from one does not react with carbonacous red) if g material until a temp of over

K / Ull n. id s.
BLGT HENGE FOR THE LECT CHON OF FIG. RON

The product of the refinery was a ! semi solid spongy mass known as charcoal iron or wrought iron, which was removed from the furnace by tongs and hammered into a solid bloom of malleable metal Later this bloom was reheated in a Chaf fery and rolled into billets, bars and other shapes. During the sevent enth century the growing shortage of wood for conver sion to charcoal caused the ironmakers to look Clarwhere for a possible source of heat Coal had been known for several beforehand and it seemed a likely substitute. Early experiments were not successful but eventually success was obtained by treating coul so as to convert it to coke in the same way as wood has been converted to charcoal. The char coal charged to the blast furnaces was re-placed by coke by Darby in 1760 The charcoal used in the relinery was also re-The

700 C is reached. I com t is it follows that man could not know non until he had a true how to make fire which in an open grite or camp live reaches a true of about 1,000° C. But pure 1 on does not melt until a true of 1.52° C, and it requires about 1,000° C, to get a proper superheat so that the metal cun flow during casting by burning coal and in at room temp in an open grate with forced draught it is suble to get about 1,000° C, which is full short of the melting point of pure from an accounts for the production of chartil iron and coke in the semi-solid pasty meltion. The fact that the blast far ince give liquid metal alose from the aboutton of 4 per cert carbon by the purion. This metal is not mallosble and melts at 1,250° C.

placed by coke by Darby in 1760 The five methods of producing the high charcoal used in the redinery was also replaced by coke and by long-finning coal colved at roughly the same period, by from this developed the Puddling process Resement in 1866, and Siemens in 1866.

of blowing cold air through molten pig iron This not only removed the excess 4 per cent of carbon but also other un desirable elements such as silicon and man ganese, and at the same time increased the temp of the metal from some 1300°C to over 1600°C The method used by over 1600° C The method used by Steiners is known as the Ligenerative principle. When coal or wood at room temp is burned by air at room temp in an open fire the maximum temp inchid is about 1000° C. The effect of putting a blower in front of the fire so as to create a good draught and force all the air into close concact with the fuel is well known. By this means temps up to 1400° C can be obtained but this is still not sufficient to melt pure iron Instead of using air at room temp Siemens tried out the idea of room temp Siemens tricd out the idea of picheating the air so that by stering off at a higher temp he expected to get a higher tinal temp in the furnace. His early experiments were unsuccessful until he combined the initial idea with another one-converting coal into a comanother one—converting cost into a com-bustille gas by burning it with a limit d air supply in a gas producer. He then preheated both this producer gas and the air for combustion to over 12:0° (and thus was able to start off work with an initial temp as high as can be obtained in the final temp reached an open grite after combustion was thus in the region of 1750° C The method of preheating the air and gas is known as the regenerative principle. The hot gases from the fur nace pass through two chambers, known as regenciators, in which brickwork is loosely stacked and to which the waste gazes give up their excess heat. On rewersing the furnace the incoming air and gas pass through these two chambers and increase their temp to over 1000° C before being burned in the furnace On passing out at the far end the waste gases reheat two corresponding chambers at that end. The stemens Regenerative furnace has proved by far the most successful way of producing steel economic ally I ketric are and electric induction furnaces have become which used for special types of steel. The temps possible in these two types are well in excess of the melting point of pure iron at 1.27° (

The development of the Integrated

Plant for the production of steel represents the most in portant recent a iv ince principle is to have the cold ovens for production of coke, the blast furnices for the production of pig fron, the stell making plant for the production of stell and the rolling mills for fabricating to slape, all on the same site. This makes for consider the same site able fucl conmy, as large quantities of heating gives are evolved from the coke ovens and I last furnaces as a by product Further leat is conserved by charging molten pg from to the steelmaking plant direct from the blast furnaces or, as 19 more usual after storing in a mixer, and

The method perfected by Bossemer was subtracted quantity of oxygen, steel is the more remarkable as it consisted simply iron plus a little carbon (0 04 to 1 5 per of blowing cold air through molten pig cent), so the fundamental action of steel making is to remove much oxygen from naking is to remove much origin round ore and replace it with a little carbon This is done in a preliminary stage of con-verting coal to coke, a primary stage of converting from ore to pig rion in blast furnacis, and a secondary step of steel making in Bessemer, Open Hearth, or electric furnaces

Production of Cole —Suitable types of coal are heated in coke ovens out of con coal are neated in coke ovens out of coal tact with sit, which converts the coal into coke and evolves large quantities of a combustible gas known as 'coke oven gas By products such as ammonium sulphate tar and crude benzol are ox tracted from the gas which is then passed

to the plant for use as a me ans of heating
Production of Pig Iron - I ig iron is produced in vertical shaft furnaces iron ore, innestone and coke being charged at the top and air blown in it the buse. An account of the process as carried out in 1531 cass 'There are five men who keep the fire to nielt the ore having 12 pence per day each And there are four men at the Bollows whereof three blows at a time and one of them stoude voyde to refresh and one of them stone vote to refresh
the others, for they blowth six or seven
hours it every gadde that is incling, and
thus they make two guide a day each
weighing 1 cwt In 1760, Darby re
placed the charcoul which had previously been used as tucl with coke Outputs by this improvement were increased to 11 tons for day. In modern blust furnace practice, output of 1000 tons per day are known

Ir in ere as inined is not pure iron and oxygen at contains varying amounts of silica line, alumina sulphur phosphorus and other extraneous materials which have to be climinated. Much of this is done in the production of pig iron in the blast furnice but there is an additional pick up of about 1 per cent carbon The effect of this is to produce a hard brittle product known as p g from which is subscriptently

treated to produce seed cost non-etc.

A modern blast furnice is a circular stack about 100 ft. high and with a maximum di uncter of 18 to b ft I here is a skip hast for taking ore, limestone, and coke fronthe bottom for charging through s bell and one at the top level. An blist is sufflied at the bac through tuyores from a powerful blowing engine and it is prefer to in Cowper stoves the idea of bot block the idea of hot blist being fir t developed by Nellson in 1528 The iron ore, huncstone, and coke write descending through the furnace meet the ascending current of hot air which turns the coke converts the ore to pig ucr, and allows the impurites to settle as a liguid slig floating on top of molten plr from At regular intervals the slag is tapped off through a slag notch and discarded, while the pig from is tapped through a separate iron notch and cither cast into pig beds or transferred while by charging hot steel ingots to the reheat ing furnaces for rolling Production of Steel from Prog Iron—Iron (astings—The pig Iron as origin—Essentially, Iron ore is iron plus a con-

melted in special air or cupola furnaces. where its carbon content is adjusted to the required amount, and other constituents such as silicon, manganese, sulphur and phosphorous regulated to the desired specification. The cupola furnace is similar in construction to a blast furnace, but is much smaller. It is charged at the top with coke and pig iron. A blast of air forced through tuyeres near the base causes the coke to burn, and develop-sufficient heat to melt the iron, which is tapped off through a metal spout into a ladle, from which it is poured into the moulds prepared to the shape of the casting required. Owing to its case of reating required. Owing to its ease of melting and fluldity when melted, the iron can be formed into intricate shapes in various sizes weighing from a few pounds to upwards of 100 tons. The various types of castings require different com-positions of metal according to the use to which they are to be put. For engineer-ing purposes the cast iron must be strong but not too brittle, while for ornamental purposes the main requirement is finidity in order that the metal may take a sharp impression of the intricate shapes. In other cases it is important that the finished easting should be willy machined. For engine cylinders the mon must have strength, hard wearing surface, and easy casting properties owing to the thin sections required in certain places. For couversion to malicuble eastings the iron should be low in silicon, giving a white tracture. The castings are malicablised by annealing in Iron ore. High duty cast irons are produced from specially refined pig iron, and may additionally contain alloying additions such as nickel, chromium, molybdonum, vanadium, etc. Cast iron pipes may be made by centri-fugal casting. In making chill castings such as rolls, the surface of the main body is rendered very hard by casting the metal into a cast iron mould instead of the usual

moulding sand.

Production of Wrought Iron.—Although the amount of wrought iron produced today is comparatively insignificant, yet it was the most important process for converting the hard brittle pig iron to a malle able product until steel manuf, by the Bossemer and Open Hearth processes became well estab, just prior to the start of the present century. In making malle-able metal from pig iron the essential process is to remove the excess carbon, process is to remove the excess carbon, sillcon, managenes, sulphur and phosphorus. This is carried out by exidation and the conversion of the exides thus formed into a fluid slag which can be separated from the metallic product. The difference between wrought iron and steel is that the former is produced in a semi-solid pasty condition much intermixed sond pasty condition inten internities with slag, while the latter is made in a completely liquid form and the separation of slag from it is virtually complete. Wrought iron is made by the puddling process. About 5 cwts. of cold pig from are charged into the furnace and melted

brings the bath up on the boil and much of the slag formed is boiled over the sill of the sing tormen is boned over the charge plate into a bugy. Later the charge begins to set back, boiling-over ceases, and then ' buddling ' commences. This is one then puddling commences. This is one of the most onerous jobs carried out close to a furnace at high heat for over half an hr. that has ever fallen to the lot of man. The pasty white hot metal is divided into four by pushing a rod through it, then each of the four pieces is turned and moved about in the furnace until it has reached a sutable state of malleability. The pieces. weighing about 80 to 100 lbs., are removed separately, and compressed by a shingling hammer to remove excess slag and formed into a suitable shape for further reheating and rolling.

PRODUCTION OF STEEL.-Steel is made by a variety of processes of which the most important are (1) Crucible, (2) Bessemer, (3) Open Hearth, (4) Electric Furnace. Except in the first case there is a further subdivision into Acid and Basic processes. As the difference between sold and basic is the same in all three processes, it may be briefly dealt with first. in an acid furnace the refractory lining, on which the thurse of pig iron and scrap steel is melted, is made of silica brick on top of which is firsted silica sand. In a basic turnoco the furnace bottom is lined with magnesite brick on top of which delomite is rangmed. Although the nature of the refractory used for the bottom is the only essential differential dif ence, yet it has a very considerable effect in removing impurities. With an acid bottom it is impossible to remove any With an acid sulphur or pho phorus; in a basic furnace their removal is possible. Acid steel is still made for special qualifies but the present tendency is to change over more and more

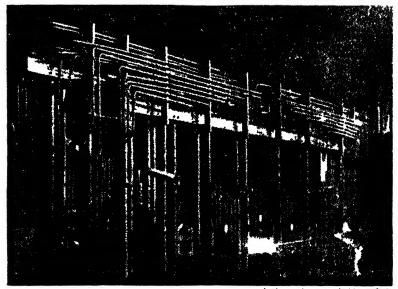

to the basic process.

Crucible Steel.-The Crucible Steel process was invented by Huntsman in 1740. It is still used, more particularly in the sheffield area, for making high gradesteels. As it is purely a melting process, with no reining, it is necessary to charge pure materials. The Crucible furnace is oval materials. The Crucion rumas of in shape and takes two pots side by side, in shape and takes two pots side by side, when the Crucible is hot enough, a charge of pollbs, of Blister steel is empried through a sheet-iron funnel and the cover put on. On melting, the charge is 'killed' with ferro-manganeso and aluminium and poured into a mould.

The Bessemer Pricess .- Bessemer took out his early patents in 1856, and within a few years the process was being operated successfully on a commercial scale. In this process, molten pig iron is converted into steel by blowing air through a Bessemer converter. The difficulties to be overcome in the early days arose from the fact that (i) it is necessary to blow vigoronsly through the molten metal right to its very core; (ii) blowing must only take place when the whole of the metal is in the converter; (iii) it must be possible to stop and restart blowing at will. The converter is pear shaped, lined with refractors, down in a lining which consists primarily containing holes in its base through which of iron oxide. On completion of melting air is forced at a pressure of about 25 lbs. the puddler lowers his damper which per sq. in. In operation the converter is

The air, in passing through the metal, removes carbon, manganese silicon and sulphur, and at the same time increases the heat from about 12.0° (as charged to 1600° C. During blowing there is a to 1600° C. During blowing there is a violent evolution of sparks from the

turned down to the horizontal and a the hearth of the furnace and inelted down charge of molten pig hou poured in, the by a hot flame produced by the combinair blast is then turned on and the continuous flame of pichested and This preheating verter turned up to the vertical position is done on what is known as the regenerat by a hot flame produced by the combu-tion of picheated air. This preheating is done on what is known as the regenerat ing principle. The wate gives coming out from one end of the furnise pass through loosely stocked brickwork to which they give up their heat Livery half bour the ducetion of flow of the gases is inversed and the incoming air and gas mouth of the converter, and the chan c in the pictuated to a high temperature composition of the metal can be tixed by (about 12:0° C). In this way it ame the appearance of the it wine. When the temper of 1::0° C are obtained when the

STIEL MAKING I UI NACL SII WI NO OF EN HEARTH PROCESS

melter judges that the metal is correct the converter is turned down, the blast switchedeff, and the finished charge poured into a ladie before teeming into moulds The Besseiner process was not widely used in this country but had a ver onsiderable development on the confluent revent years, two large basic Bessemer plants have been erected in this country with satisfactory results

The Sumens Martin Open Bourth Pro cess—In Statems Open Hearth process
was per's ted by Sir W Stemens in 1866, and the first commercial plant for its production was creeted at Language Wales, duction was created at Lanco > Wales, in the following year. The original fur in the following year nace was about one ton capacity, and had a potential output of about 1000 tons per year. Today, shout 100,000,000 tons are made annually by this process. Cold pig iron and scrap steel are charged into moulds The pig iron used values from

two are combusted in the hearth of the functe. The steel is thus heartd to a temp of 1500°C which is the maximum gene ally required for low carbon steels Afte cl at molting, there is a quantity of m lien metal covered by a slag containing The tomaining impur the in purities mes in the metal are removed by feeding in n ore and scale or limestone until a suitable composition of the metal is ob tui red this is determined by takıng samples from the bath and testing them by chemical analysis. When the composition is con idered satisfactory, a tup hole is opened at the back of the furnace and the molton metal and slag is allowed to flow out into ladies. The metal is deoxidised to suitable condition by additions of forro manganese, ferro-silicon, and/or alumin ium I rom these it is teemed into 20 to 80 per cent, according to the required composition of the steel, an average figure being about 50 per cent each of pig

iron and scrap metal.

Electric Furnace Steels.—Electric furnaces may be classified into two types, (i) are furnaces, and (ii) induction furnaces. Of these, the former is much more widely In the arc furnace, heat is generated by a spark between the carbon elec-trodes and the charge of metal. The trodes and the charge of metal. The temp. of the arc itself is well over 3000°C., so that the local heat is very intense. Owing to the high cost of electric current required, the electric are process is more generally worked with a charge of 100 per cent of scrap steel, in order to cheapen the process. The charge is melted down m a manner similar to that in the Open Hearth process. It is further refined as before by additions of iron ore and lime-stone. Finally the modal is cast and teemed as before. The electric furnace is used in the manuf, of high grade steels, the basic furnace being more widely used as it has considerable advantage- in removing sulphur and phosphorus and producing 'Killed' steel comparatively free from oxide inclusions. It is improbable that the electric furnace with able to compete electric furnace vi, able to compete with the Besseiner and Open Hearth processes in the minut, of steel for constructional purposes and the more common uses, except under special conditions. It will, however, provo a scrious rival and will probably finally oust the older processes of steel making in high quality grades.

The electric induction furnace has been further advantageous in replacing the older crucible steel process. As in the erueible furnace there is no relining, and melted down by a high frequency induction current which generates terrific heat in the metal itself, and causes it to melt rapidly. At the same time the metal is stirred up so as to give very uniform com-

position.

Steel Castings .- These can be made from open hearth furnaces, both acid and basic, from small converters, from crucibles, and from the electric furnace. For general toundry work it is more common to find a small open hearth or Tropenus converter, fed with molten from a cupola. important to see that the metal is thorougly killed during the casting operation, otherwise difficulties are likely to arise due to the formation of blow-holes inside the casting. For steel castings the moulds used may be classified of ther as 'green sand' or 'dry sand,' the former being used for light eastings and the latter for heavier eastings. 'Green sand' moulds is the general term for those which have not been dried previous to the metal being poured in. 'Dry sand 'moulds are made much as above but are faced with moulder's com-

position and give a clour skin.

Straight Carbon Steels.—The properties of steel are considerably altered by varying the carbon content. In general, increasing carbon content from 0.01 per cent to

ductility and machinability. Some typical ranges and uses are indicated in the following table :-

Iron

Carbon Name Uses 0.01 0 08 Dead mild Sheets, tinplates. pipes, plates. 0.05 0.25 Mild Structural steels, teinforcing rods. 0 26 0 45 Carbon Rail steels, axles. 0.4) v.65 Medium Holding down carbon bolts. 0 6 , 0 9 High Drills and other rarbon tools, 0 9 1.5 Ultra High (Idsels, turning tools, files, can bon razors, etc.

Straight carbon steel can be hardened by quenching in water from a suitable temp between 750 and 950 C, according to arbon content. This hardening is accompanied by an embrittling effect which can be imminised by tempering the quaching steel to suitable temps, below. 700 c. The degree of tempering is controlled by the time and temp, at which the tempering operation is carried out.

illog Stels.-Steel has found a very extensive use in industry and commerce due to the fact that it is possible to produce such a wide range of properties by varying the carbon content and heat treat there are certain difficulties with straight carbon steels which have been called 'alloy steels,' i.e. steels containing considerable percentages of alloying elenumber of such steels on the market today is well into the thousands, but efforts were in the during the recent war years to reduce the numbers and so simplify producerucible futuace there is no reaming, and place the numbers and so simplify produc-pure metal is charged into the crucible and plan, and yet rotain the valuable properties which such stocks have conferred on them

by the use of alloying additions,
\[\langle it t \] Nikel steels, owing to their
strength, are widely used for stressed
puts \[\text{With earloon around 0 1, per cont} \] and makel 3-a percent, the so-call d'case-hardening steels' find a wide application in a avily-stressed parts requiring a very Laid outer surface and a touch core. With a somewhat higher carbon content and smaler nickel, the steels have many uses in engineering where both strength and toughness are required. High nickel steels containing 25 10 per cent nickel are used for their resistance to corrosion, special electrical properties, and due to the inct they are practically non-magnetic.

Chromium-Chrome steels are used because they produce greater strength and hardness. Addition of from 0.5-2.5 per cent chromium are typical. Such steels the used for tyres and springs. The addithe near for tyres and springs. The addition of 12-20 per cert chronium produces the well-known stanless stoels, first developed by Harry Brearley about 1913. Chrome-Nickel.—It is more usual to find both chronium and nickel, as the

combination makes for many advantages in hardness and strength combined with the carbon content. In general, increas case of heat treatment, to produce suiting carbon content from 0.01 per cent to able properties. In the stainless steel 1.5 per cent gives harder steels with a scries, the so-called 18/8 (18 per cent higher tensile strength but decreasing chronium, 8 per cent nickel) is widely used today, as they have the widest range of corrision resist int properties. They are also satisfactory as heat resistant steels. They have a wide use, but perhaps the best known is for table knives, where they have been a boon to the harassed house wife

1 anadrum -−Vanadıum generally pro ent in allow t els in relatively small amounts less than I per cent and more often less tain 0 2) per cent but this has an important effect in increasing the toughness of the stell. It has pethaps its widest use in chrome vanadium steels, which ar used because of their extra nestrength and tourhiess. A common analysis is 1 per cent chromium and 0 1) ent vinadium It is also a ided in small amounts to produce a high denter of hardness in tool steels, armour piercing projectiles rock drills etc. Varidium steel cistings are noted for their high elastic properties strength and bughliess. Malybdenum.—Nolvodenum is precent

in steels also in quantity a inder I per cent, and in association with the more common alloying elements such as nickel and chromum It has got a marked effect in increasing the strength both at room and chyated trups and in an im portant addition to remove a dim ulty known as temp r buttl ness. There is a fairly wide it igo if molybdenum steels each type having its own special application. Molybdenum from castings in used where a hard wearing surface is a quire l while it has also been found adv intageous

in chilled from rolls Manganese -Although manganese is present in all strught cubon steel to an extent of 0 3 1) per cent it is not considered as an alloying addition—the high the high manganese steels containing thout 12 per cent are true alloy sticks. They were put on the market by Sir Robert Halifeld in 1882, and have found in any uses due to their hardness and high resistance to we in They are quite commonly used for railway crossing points and for crushing michinery in wartime they were used for steel helmets. It is a non magnetic steel

Silicon -High silicon steels containing of to o per cent have important electrical properties—a high permeability with low hysteresis and eddy current losses they are used in electrical transformers—teels containing from 11 to 1 20 per cent have a high resistance to cor rosion by acids which enables them to be used for containing vessels. A silico manganese steel has found extensive uses for general engineering purposes and armour plate
2 ungsten — This element is used in high

speed tool steels and in magnet steels effect in high speed tool stocks is to retain the cutting edge while allowing the stock to reach a red heat. Ordinary carbon tool steels which may be hard a mitually are tempered under similar con litions and lose their hardness Modern high speed tool steels contain 15 to 20 per cent tung sten

Steels containing from 5 to 6 per cent have good magnetic properties and are used for magnets of generators, magnetos, etc.

Cobalt - Cobalt steels containing from 2) to 3) Iti cent cobalt give a magnet st el superior to the tungsten magnet steels

C pper -About 0 5 per cent coppor is sult to be beneficial in increasing the cor rosion resistance of ordinary mild carbon

uteels.

Iron Gates, narrow passage interrupted by rapids and tocky shoals, in the course of th R Danube below Orvova (Rumania) In 1830 96 the Hungarian Gov at a cost of £300 000 succeeded in rendering the channel navigable by blasting and canal using A pilotage service is maintained here by the Danube Commission

Iron Mask, The Man in the mysterious figure of great romantic interest in Li hist He was a political prisoner in the reign of Louis XIV, who when travelling from one pri on to another, always work a mask He finally died in the Bestille in 1703. The mystery or his identity still remains an

historical problem

Ftienne du Junca (d 1706) lieutenant of the Bastille, recorded in his official journals that on Sept 18, 1698, Saint Mars the new governor, arrived at the prison from the lies St. Marguerite, bringing with him in a litter a prisoner whom he had formerly held in custody at Pignirol This prisoner always wore a black vivot mask, and his name was never told He died on Nov 19 1703, and was buried in the par cometery of Saint Paul, his name being register d as 'M de Marchicl. The name at utaily recorded in the register was 'Marchiely' Stories spread about the prisoner even during his lifetime, and in 1745 and 1746

it was asserted in Mémoires Secrets pour servir à l'histoire de l'erse that he was the duke of Vermandois, the illegitimate son of Louis XIV. and Mile, de la Vallière, and of Louis XIV. and Mile, de la Vallière, and was imprisoned for lite for having assaulted the grand dauphin. Public interest was further aroused by Mouly's romance, L'Homme an masque de fer, and by the writings of Voltaire on the subject. Voltaire, under the head 'Ana' in Questions sur l'encyclopédic, asserted that the 'Mask' was a bastard older brother of Louis XIV. and the son of Anne of Austria and Cardinal Mazarin. Abbé Soulavio, in Mémoires de Marchal Richtheu, made out a case for a twin brother of Louis XIV., but this theory is historically untrue, though it appealed to Grimm, Zschokke, Fournier, and others. A much more feasible conjecture is that

A much more feasible conjecture is that the 'Mask' was Count Mattioli, a minister of the duke of Mantua (b. 1640). He negotiated with Louis for the surrender of negotiated with Long to but the fir king, discovering that his dealings were treacherous, had him kidnapped (1679) and conveyed to Pig-But there was no secrecy about Mattioli's imprisonment, and it appears more than probably that Mattioli died at

Pignerol in 1694.

The mysterious precise has also been identified with Eustache Dauger, imprisoned at Pignerol in July 1669.
Andrew Lang, in *The Valet's Trapody* (1903), identified this Dauger with one Martin the valet of Parameters. Martin, the valet of Roux de Marsilly, a Huguenot intriguer in England. Barnes (The Man of the Wask, 1908) found Lang's theory untenable, and suggested that Dauger was really James do la Cloche, the natural son of Charles II. Lang proved subsequently that James de la Cloche was identical with 'Prince' James Stuardo, who died in Aug. 1669 at Naples.

iron Work. Iron, like bronze has been used for easting, but the purest use of iron in decorative art is to be found in wrought I W. Since early days from has been used for weapons of war, but, owing to the effect of rust on iron, little et by iron work is left to us. Iron appears to have been used by the Egyptians as early as 1500 used by the Egyptains as early as 1500 B.c., and on a large scale in Babylon after old B.c. for such things as bolts and hinges. The Assyrans used from a great deal for the framework of fortifications and the coverings of buildings, although with them iron was considered a precions metal and was probably scarce. The Hebs, used iron considerably, and the Phenicians made vessels of non with which they statues, while Plutarch writes of a polished from belinet which shope blue like siver. We know from writings that the Gks. fully appreciated the beauty of iron and knew about the casting, forging, He was appointed to ommend the Brit. Expeditionary force sent out to Archangel and inlaying of iron. They used iron for during the latter part of the First World such things as chariots, agric, implements, war. His conduct of the operations against the Bolshevist forces concentrated and jowellery were often made of iron.

The Roms, continued with I. W., using t The Roms, continued with 1. W., using the metal for armour, window-bars and grilles. Barbaric races used iron before they were conquered by the Roms., and continued to use it with greater success than their conquerors. Up to the fourteenth century I. W. was the work of a smith, and he made and decorated such things as grifles, door decorations, and hinges. During the fourteenth century, a change came over 1. W. The smith began to work the iron when cold, using file and saw, chirel and vice, whilst sheet iron also was cut and hammered into patterns. Thus came into being the armourer and lock-mith, who used heat for working the iron only in the preliminary stages, and who were capable of carving a statuette out of a solid lump of iron. This change over I. W. came from the E., and designs often more suited to wood and stone were carried out in iron. The Fr. Iron-workers produced after this time the best I. W., their work being both beautiful in design and delicate in nni-h. During the cen-turies that followed iron was used for such things as locks, door handles, screens, firebacks, knockers, grilles, gates, and railingand the designs used in the work included and the designs used in the work included scrolls, rosettes, leaves, flower-patterns (particularly the passion-flower), and horaldic devices. See C. Floulkes, Decorative Ironwork, 1913; J. S. Gardner, Ironwork, 1927-30; J. A. R. Stevenson, Din of a Smithy, 1932.

Irony (Fr. ironic, Lat. ironica, Gk. eipereta, dissimulation), a form of ridicule in which statements, apparently accepted, are held up to scorn, saying one thing and meaning another. A tamiliar example may be found in Pilate's question to the Jows, 'Shall I crucify your King?' (John Jews, 'Shall I crucify your King?' (John xix. 14). Socrates used this mode of speech and raised it to a philosophical fine art. Among Eng. writers Swift holds the

palm for abundant and apt examples of I. Iroquois, name given by the Fr. to one of the great confederations of the N Amer. Indians. The league was originally omposed of five thee, the Mohawks, Oncidas, Onondagoes, senecas, and Cay-ugas, called the 'Fro Nations,' and pro-bably dating from the sixteenth century. In 1715 the Tuscaroras were admitted to the league, which was henceforth known as the Six Nations. The Is, were undoubtedly the strongest confederation of Indians in N. America, and numbered, at that time, about 11,6-0, of whom 2150 were picked warriors. Their original home seems to have been round the upper reaches of the R. St. Lawrence, from which they moved south-westwards round the shores of Lakes Untern, Huron, and Brie and occupied the greater part of Upper Canada, the whole of New York State, and a large part of Pennsylvania, Ohio, and Michigan, while a section of them moved 5, through Virginia and Ten-nesse to the Carolinas. The league was strong enough, not only to hold its own against such hostile tribes as the Hurons and kries, but to extend its dominion over the Mohicada, the Nanticokes, Shawnees, Mississaugies, and other Algonquin tribes. In the border warfare

with the Fr., the I. always sided with the Eng., while their bitter encoules, the Aigonquins, fought for the Fr.; they also fought for the Eng. in the Amer. War of Independence. The Iroquelan stock, including Iroquels, Wyandot, Cherokee, and Klowa number 52,400 in the U.S.A. There are reservations in Canada. New There are reservations in Canada, New York, Oklahoma, and Wisconsin. They have made considerable social progress, adopting the customs of Rag. civili-ation and becoming, for the most part, Protestants, and attending the Eng. schools.

tants, and attending the Eng. schools.

See W. Halo, The Iroquans Book of Rites, 1883; J. C. Pilling, Bibliographies of Eskimauan, Stouan, Iroquoun Languages, 1888 (Washington); J. N. Hewitt, Iroquois Cosmology, 1929; A. Pound, Johnson of the Mohawks (1715-71), 1930; F. W. Seymour, Lords of the Valley, 1930, and C. Wissler, The American Intian, 1943.

hrigation, see also DRY FARMING. hrigation (Lat. in and rigare, to water) the artificial application of water to is the artificial application of water to land, as contrasted with watering by manual labour. I. is of great antiquity, as is shown by many I. works in India, 5 xypl, and China. (See also under IRAQ). No face of scientific I. is found in the sculptures and paintings of anct. Egypt, but in works of as early a date as 2000 B.c. the practice of baling up water is repre-sented. Among the simpler forms of water-reising machinery the following may be mentioned: a pole with a bucket may be mentioned: a pole with a bucket at one end of a crossbeam and a counterpoise at the other (known in India as a denkii,' or 'paecottai,' in Egypt as a 'shadof') largely used in the Niie dist; rude waterwheel, consisting of earthen pots on an endless chain which runs round the wheel, is termed a 'sakya' in Egypt, and a 'harak' in N. India. By means of this a pair of oxen can raise water as far as 18 ft., and keep from 5 to 12 ac. irrigated. 'The 'churras' of India is a large leather bag, suspended from a rope which passes over a pulley and is raised by a pair of bullocks which go up and down a slope equal in length to the depth of the well. I. which is effected by means of canals naturally depends on the discharge of the riv. In connection When the riv. of the fiv. in connection. When the fiv. saries very much in vol., being very low in the dry season and flooded in the wet, a complete control of the water is necessary for the engineers, and the canal is therefore yet; ostly. Such is the system on for the engine of the system of the Cuttack Canal, in connection with the Mahanadi R. The can its of Lombiardy,

electric power Today the USA, ranks third in the irrigation countries of the world India has about 35 million ac.; China about 50 millions, and the USA. over 20 millions In Igypt I. works have been been carried out on a very large scale the delia formed by joining Carro, Rosetta, and Damletta is interacted by many channels, and much benefit his resulted Lower Igypt has been irrigated by a dam constructed at Assut in 1902, which however, falled in very diverserous which, however fuled in very dry seasons The difficulty was partly met by raising the height of the barrige so as to hold on the other hand, are much is secostly, as there is no great variation in the rive on which they depend, the Luno and Adda, struct a feeding lake. This was accommoding to the restaming influence of plished by constructing the Aswân Dam Lakes Maggiore and Como. The canal at rest of \$1,000,000 and thus creating a

In the 5 of India I is always required for the me and sugar cane crops though make and mulet can be grown without any such aid. Generally speak without any such aid Generally speaking, the other dists of Indiacian manage without I, in good vers. When most of the ruln-watered in 15 of the U.S.A. had been taken up by settlers, the problem of the so-called arid lands came into promin once. There were vest uses in the Middle ence. There were that head in the mindle and far W states and in some pures of the S, states, deficient in water—(empanies were formed solely for irrigation purpose-and to fix services to intending settlers, and under the Reclamation Act of 1903 the U.S. Gov. set aside a sum from the sale of public lands to finance great irrigation projects. Water rights were then sold to the settlers. In many places enormous dams have been built, and these, in turn, hary for vegetation, but fertilises the oil have proved valuable, because of hydro-by furnishing such mineral constituents

m come dam at Alicinte, or the Monegre R dites from 17.9, and is a dito have a capacity of 130,000 000 cube fit of water in Italy. Spain, and in the S of France I. Is extensively carried on The newly constructed Hume Reserver, at the junction of the Nurray and Mitta little live, stores
Il million oubic ft of witer which runs
of a citchment area of 6000 sq. m. of mountainous country in the border of Victoria and N - W (see MURRA) hiver. Experience has shown that for su cessful I. a thorou h system of drain in in conjunction their with is a necessity this principle was overlooked at first in modern works, and the complete satura-tion of some dista in consequence had a prejudicial effect on their fertility, toenerally speaking the water used in I. not only supplies the moisture so necesas salts of potash and soda, sulphates of lime, soluble silica, etc. In propor-tion as the water is rich in these, the effect on the soils is similar to that produred by a dressing of bone-manure. Sewage water is unquestionably even more valuable for irrigating purposes than ordinary water, owing to the large amount of putrefied animal and vegetable matter contained therein. The drainage of many tons, is thus turned to a profitable use at the present time. Various systems of I, are used to suit the special requirements of the case, one of the following being generally used in England: (1) Bedwork I.; this is the most effective system, but is also the most costly. (2) Catchwork I., in which the same water is used many (3) Subterraneous I., in which the water is drawn up through the soil to the surface. This is applicable only to level surfaces. (4) Warping I., in which the water is allowed to stand on the land until it has deposited the mud, etc., contained in it. The proper management of watermeadows requires great care and skill. There must be neither too much nor too little water; the flow must be regulated

with exactitude, etc.

Irrigation problems of the British Empire.—It was estimated by F. S. Harris (Soil Alkali, New York, 1920) that in 1920, about 100,000.000 ac., or 7 per center that the state of of the total area of the earth's surface under cultivation, was farmed by I. Sinco that year thousands of additional acres have been added, and it is thought that the area of land under I. will continue to increase. This is probable because nearly one-third of the earth's surface receives only 10 in. of rain or less annually, and over another third the rainfall is between over another third the rainfall is between 10 and 20 in. Over most of this latter area little if any additional water is needed, except for intensive crops, although special nfethods of cultivation, aimed at moisture conservation and known as 'dry farming' have to be adopted. But on land receiving less than 10 in. I. is generally essential if any kind of profitable crop production is to be undertaken. The geographical distribution of regions of deficient rainfall comprises a considerable proportion of the Brit. Empire and its able proportion of the BHL Empire and its mandated ters, (particularly N. Tanganyika). The main areas concerned are parts of Canada W. of the 100th meridian; N.W. India up to the Ganges; most of Australia; Palestine; considerable portions of S. Africa; N. Tanganyika; and the Sudan. Within these areas the supply of Inventor is conversely for unable formula. of I, water is necessary for arable farming. The successful development of a stretch of land for 1, farming and the maintenance of the fertility of the soil involves a constant attention to economic, engineering, and scientific factors. The engineering problems connected with the construction of dams, main and branch supply canals, drainage ditches, and pumping stations, like the economic factors, are specific to each dist, and are executed in accordance with fixed principles. The scientific fac-tors comprise the questions of the com-position of the water available for I. and

properties of the soil. They apply not only to the development of new areas, but also to the maintenance of the fertility of existing I. areas. The scientific factors relate to the concentration of soluble salts (sulphates, chlorides, nitrates and car-bonates of sodium, potassium, and mag-nesium, and chloride and nitrate of sodium) in arid conditions; the effects of soluble salts on soil fertility and on the physical state of the soil; and the tolerance of vegetation to alkali conditions. The complete cycle of soil changes which are traceable may proceed rapidly or be so slow that a noticeable change occurs only over a considerable period of years; but sooner or later the danger of deterioration confronts every irrigated area. Thus the famous irrigation of the Nile Valley, where fertility has been maintained for centuries, now appears to be showing the first signs of deterioration owing to a change in cultural methods. In the old or basin system of I., after the winter crop of wheat or bersim, the land remained fallow from May to Aug. Economic factors, in particular the extension of the area under cotton and maize, have necessitated perennial I., the necessary water for these summer crops being held by the Aswan dam and delivered as required. Under this system the frequency of the sheraqui or summer fallow period is much diminished, with the fallow period is much diminished, with the result that difficulties in cultivation and decrease in yield of the more sensitive crops are beginning to creep in. A. Howard and ti. L. O. Howard have summarised the principles underlying water saving for the wheat crop in India as follows: (i.) I. water must be spread over the largest possible area; (ii.) it must interfere as little as possible with the natural aceration of the soll; (iii.) heavy waterings reduce the proportion of grain to total crop and increase the growth period; (iv.) a limited water supply encourages deep root development; and (v.) the soil moisture must be conserved as fur as possible by a surface mulch of as far as possible by a surface mulch of dry soil. The problems of I. in the Brit. Empire are being faced in different ways in different parts; but it is evident that I. is not simply a matter of providing a water supply; it necessitates constant vigilance by soil experts, otherwise de-terioration sets in. See B. A. Keen, Memorandum on Irrigation Practice and Problems (Empire Marketing Board pam-

Problems (Empire Marketing Board pain-phiet), 1927.

Irritability in Plants, or Sensitiveness, is the manner in which they respond to the action of external forces such as (1) grav-

action of external forces such as (1) gravwith fixed principles. The scientific factory ity, (2) light, (3) mechanical contact or tors comprise the questions of the composition of the water available for I. and gravity is known as geotropism, and to the chemical composition and physical light, hel otropism; and members are

positively or negatively geotropic or belictropic according as they grow towards or away from the force. Thus roots are negatively heliotropic and positively geotropic, and shoots are just the reverse. Instances of irritability to contact are the leaves of the sensitive plant sundew, the stamen of Berberis, and the lobes of the stigma of the musk, which close together when touched. Response to presence of moisture is shown by growing roots, which are said to be positively hydrotropic.

Irritant Poisons, see under Poisons.

Irsina, tn. of Italy, formerly known as Montepeloso, 24 m. N.E. of Potenza in the prov. of Basilicata. Pop. 7600.

Irthlingborough, par. and vil. in North-amptonshire, England, on the R. Nen, and 2 m. N.W. of Higham Ferrers. It has large ironstone quarries, and manufs. of boots and shoes. Pop. 5000.

Irtisch, or Irtysh, riv. of Siberia and a trib. of the Ob or Obi. It rises in the Altai Mts. of China, flows N.W. through Lake Zaisan, and joins the Ob 180 m. N. of Tobolsk. It is navigable during about eight months in the year for some 2000 m. Length 2500 m.

Irulas, tribe, numbering in all about 86,000, dwelling it the Nilgiri hills, Arcot, the forests of S. India, and other places in

the vicinity.

Irun, tn. in the N.E. of Spain, in the prov. of Gulpuzcoa, on the l. b. of the Bidassoa. It was a garrison tn. and the most important custom-house in Spain: but suffered tragically in the Civil war being almost wholly destroyed, in 1936, in the struggle for San Sebastian. There are tories. Pop. 12,000.

Iruha, see Pamplona.

Irvine: (1) Par., royal burgh, and seaport of Ayrshire, Scotland, situated on the R. Irvine. Its prosperity has increased since the improvement of the harbour in 1873. It has an academy, a tn. hall, a statue to Burns, and is the bp. of James Montgomery, the poet, and John Galt, the novelist. Elizabeth Buchan founded here her religious sect, the Buchanites, in 1779. I. exports fron, coal, and chemicals. Ship-building is carried on, and there are engineoring works, steam saw-mills, tanneries, iron and brass foundries. Pop. 12,000. (2) Riv. in Ayrshire, Scotland, which rises on the borders of Lanarkshire, flows W dividing the dists. of Cuuningham and Kyle, and empties itself into the firth of Clyde. Length, 30 m.

Irving, Edward (1792–1834), Scottish divine, b. at Annan. Dumfriesshire. Having been educated at Edinburgh Univ., he became a master at Haddington (1810) and at Kirkcaldy (1812). He here tanght Jane Welsh (afterwards Mrs. Car-lyle), and fell in love with her, but he was already engaged to a Miss Martin, whose already engaged to a Miss Martin, whose family prevented him from breaking off the contended and the engagement. In 1815 he obtained a licence to preach from the Church of Scot-cland, and four years later became an assistant to Dr. Chalmers, then in Glasgow. In 1822 I. became the minister of Cross Street Chapel, Hatton Garden, London, and his sermons became extraordinarily Becket at Drury Lane, where he was

In 1823 he pub. For the Oracles popular. of God and For Judgment to Come, in which he declared his belief in the second perhe declared his pener in the series sonal advent of Jesus Christ. His popularity waned as his views developed. His belief in Christ's oneness with men in the attributes of humanity was misinterpreted, and he was accused of imputing sinfulness and he was accused of imputing sinituness to Christ. In 1830 he was tried before the London Presbytery, and two years later was deposed from the ministry. In conjunction with Henry Drummond he estab. the 'Holy Catholic Apostolic Church,' the adherents to which came to be known as 'Irvingites.' He and his followers made a particular study of the Apocalypse, and recognised orders of apostles, prophots, evangelists, and angels. I. became 'chief pastor 'of this new sect's first church in Newman Street, but died shortly afterwards in Glasgow. His complete which the contract of the co snortly atterwards in Glasgow. His complete works were pub. in 5 vols. by Gavin Carlyle (1864-65). See Carlyle's Reminiscences, 1881; and biographies by W. Wilks, 1854; and Mrs. Ollphant, 1862. Irving, Sir Henry (1838-1905), Eng. actor, whose original name was John Henry Brodribb, was the son of a Somersetshire tradegman, who atterwards and

setshire tradesman, who afterwards set-tled in London. The boy's tastes always inclined to the stage, and, while he was a city clerk, he took lessons in elecution, fencing, and dancing, and devoted such leisure as he had to reading and studying plays and frequenting the theatres. At the age of eighteen he threw up his job and secured an engagement in a stock company at Sunderland and, later, and the state of the company at Sunderland and, later, another at Edinburgh. He remained in the provs., learning his art, until 1866, when he made his London debut at the St. James's Theatre as Doricourt in The Belle's Stratagem. At the same theatre, in the following Dec., he played Petruchio to the Katherine of Ellen Terry. He was now tirmly estab. as a London actor, but he did not achieve any marked success until 1870, when his performance of Dighy Grant in *The Two Roses* made him popular. His Alfred Jingle in *Pickwack* added to his laurels, but he first became famous then he absend to The Zillast the Version of the laurels. when he played in The Bells at the Lyceum (Nov. 25, 1871). In 1874 he played Hamilet for two hundred nights, and with this performance, around which a con-troversy arose as to his rendering, he rose to the head of his profession. Four years later he became manager of the Lyceum, and, with Ellen Terry as his leading lady, made it the first theatre in the country. His prin. successes were Hamlet, Shylock, Benedick, Malvolio, Dr. Primrose (in Olivia), Landry (in The Dead Heart), King bear, Becket (in Tennyson's play), and Corporal Brewster (in A Story of Water-loo). I. was not a good man of business; his production expenses were heavy, his generosity unbounded, and when in 1898

Irwin, Edward Frederick Lindley Wood,

first Baron, see "I Marca Viscount". Irzykowski, Karol, (b. 1873), Polish writer and literary critic, b. at Blasz-kowa. In his Paluba and Dreams of Maria Dunin, which appeared in 1904, he showed himself a precursor of Proust and Freud. His earlier and precocious books were follawed by Poems and Drames (1907), Decil Knows Where (1922), and various essays and studies. In later years he devoted himself to literary criticism.

Is, see Hir. Isaac, only son of Abraham and Sarah, b. in their old ago (Gen. xvii. 17). For the story of his being offered as a sacrifice and the miraculous intervention of Jehovah see Gen. xviii. When forty years old he married his cousin Redecca, who bere him twin sons, Esan and Jacob. He seems to have lived a peaceful, uneventful, nomadic life, and to have died in Hebron at the age of one hundred and eighty. See ABRAHAM. See also G. Rawlinson, Isaac and Jacob (Men of the Bible series), 1890.

Isaac I. (Comnenus), emperor of Constantinople (1057-59), the first of the house of Comneni. He had served in the army, and on the deposition of Michael VI. was declared emperor by the soldiers He repaired the finances, forced the clergy to contribute to the state revenue, and to contribute to the state revenue, and repolled the attacks of the Hungarians in the N. In 1059, being overcome with a serious illness, he abdicated and retired to the monastery of Studion, where he died in 1061. His Scholia and other works on Homer are extant.

lasac II. (Angelus), cunperor of Constentinople (1185-95 and 1203-04), succeeded Andronicus I. In 1197 his brother Alexius seized the throne by force and I. was blinded and imprisoned. Eight years later he was restored to the throne, but was too weak, mentally and physically, to rule, and died in 1201, shortly after Mourzouphes, his general, usurped the

throne.

Isaacs, George Alfred (b. 1883), Brit. politician and trade union official, b. in Former member of the council, London. and mayor of Southwark. Elected Lab. member of Parliament for the Grave-end div. of Kent 1923 24 and for Southwark (N.) in 1929-31 and since 1939. Parl-private secretary to the Lord Privy Scal in the second Labour gov. (1929) who had special charge of the unemployment prob-Also parl, private secretary to the scretary of state for dominion attairs (1939) and, on the advent of the first national gov., acted in a similar capacity to the leader of the Labour opposition. Member of the executive of the Trades thon Congress, 1931; parl. private scretary to the first lord of the Admir-alty, 1912-15; P.C. 1915. Member of the Royal Commission on Workmen's Compensation, whose recommendations resulted in the passing of the National Insurance (Industrial Injuries) Act, 1916, Secretary of the National Society of Operative Printers, and Assistants (Natsapa); past president of the Printing and Kindred Trades Federation; chair-man of the Trades Union Congress General man of the France Union Congress General Council, 1915: president of the World Trade Union Conference, London, 1945. Minister of Labour and National Service since 1915. Editor of National Journal, Pub. Phys Story of the Newspaper Printing Pages 1935. Pr. 88, 1931.

Isaacs, Sir Isaac Alfred (1855-1935), Australian lawver and statesman, b. and educated at Melbourne. Admitted to the Victorian Bar, 1880. Q.C. 1889. Member of Legislative Assembly, Victoria, 1892. Solicitor-General of Victoria, 1893, and Attorney-General, 1894; entered Commonwealth Parliament, 1901. Was a member of Convention which framed Commonwealth Constitution. Attorney-General. Commonwealth of Australia, 1905. High Court judge, 1906. Knighted, 1928. Chief Justice, Australiar Commonwealth, 1930-31. Governor-General of Australian lawyer and statesman, b. and wealth, 1930-31. Governor-General of Australia, 1931-36, he being the first

Australian to be so appointed.

Isaacs, Jorge (1837-95), Colombian poet and novelist: b. at Cali: son of an Eng. Jew turned Christian and planter and married to a Sp. woman. Aftenued school at Begota; at sixteen went to London to complete his education. In 1864, his first vol. of pooms was enthusiastically received. In 1867 he pub. Maria, an adultic romance, somewhat autobiographical. Filled a diplomatic post in chile. Was a member of Congress, and director of public instruction at Ibague where he died.

Isaacs, Sir Rufus Daniel, see READING, MARQUESS OF.

isandwana, or isandula, isolated kopie in Zululand, 60 m. W.S.W. of Ulundi, S. Africa. Here, during the Zulu War, Col. Durnford's column was surprised, on Jan. 22, 1879, by 20,000 Zulus under Cetewayo. and annihilated, Col. Durnford and Pulleine being killed.

Isar, riv. of Bavaria, rising in the Tyrolese Alps and flowing N. and N.E., passing Munich. It enters the Danube opposite Degendorf. Length 180 m.

Isaure, Clemence, see CLEMENCE IS MIRE.
Isauria, anct. dist in Asia Minor,
bounded by Pisidia, Lycaonia, and
Cilleia. In Rom. times, the inhab, were a barbarous race and daring sea-robbers. They were overcome by P. Servilius in 78 B.C., but soon rebelled and were a constant source of trouble. The rebel Trebel-lianus, in the third century A.D. assumed the title of emperor, but was overpowered and executed. The Isaari are said to have been effectually subjugated in the reign of Justinian in the sixth century. 1. has Justinan in the sixth century. It may had the honour of producing two emperors, Zeno (A.D. 474–491) and Leo III. (718–741). See W. M. Ramsay, Historical Geography of Asia Minor, 1904.

Ischalis, see Irval 1998.

Ischia (anct. . Enara), very fertile and picturesque is. In the Bay of Naples, Italy. In the centre is an extinct volcano, from In the centre is an extinct voicing, com-which the surface gradually slopes all around towards the sea. Corn, fruit, and wine are grown; straw plaiting and fishing are carried on. The is, was disturbed by curthquake shock in 171 n.C., 92 n.C., A.D. 1302 and 1883. The chief the, are I., the eap, and Casamicciola, visited for its hot springs. I. was sacked by the pirate Bar-barosa in 1541 and captured by the duke of Guise in 1547. It was occupied by Nelson at one time, and Murat took refugo here in 1815. It was originally colonised by the Gks., who called it Pithecusa. Pop. (is.) 29,500; (in.) 9200. See A. Rittmann, Geologie der Insel Icchia, 1930.

Isohl, or Bad Isohl, magnificently situated inland watering-place of Upper Austria, 30 m. E.S.E. of Salzburg. Chiefly known for its medicinal baths and as the summer residence of the former Austrian imperial family. An important industry here in salt. Pop. 10,300.

Iseo. Lago d', picturesque lake of Italy, 15 m. long and about 2½ m. broad, at the foot of the Alps, between Bergano and Mercial M. Alps, between Bergano and Mercial M. Alps, between Bergano and

Brescia. It is traversed by the R. Oglio. Iseran, pass in the Alps (9085 ft.), con-necting the valleys of the Arc and the Isero. The neighbouring peak, Mt. Grand Paradis. was for years confused with Mt. Iscran, owing to the fact that the Montagnards cell not a peak but a series of pas-tures a mont and that the pastures here were called Mt. Iseran.

Isère: (1) dept. in the S.E. of France. between the Rhone and Savoy, formed out of the anet. prov. of Dauphine. The S.

Rhone surrounds it on every side but the S., while its trib., the I., flows through it.
The dept. is divided into three arrons.,
Grenoble, La Tour de Pin, and Vienne. The cap. is Grenoble. Silver, lead, coal, and iron are mined; slate, stone, and marble quarried; and gloves, silk, paper, and cement manufactured. Green Chartreuse was manufactured in the monastery 14 m. N. of Grenoble. Area 3179 sq. m. Pop. 573,000. (2) Riv. rising in the Alp., and, winding W. and S.W. for 180 m. (100 m. of which are navigable) through the depts. of Savole, I., and Drôme, joins the Rhone a few m. above Valence. Valence.

Iseriohn, tn. of Westphalia, Prussia, 36 m. by rail S.E. of Dortmund. It has manufs. of cuttery, bronze, and other metal articles, furniture, and chems. Pop.

31,000.

Isernia (Æsernia), tn. in the prov. of Campobasso, Italy, situated in the Apennines, 50 m. N.E. of Naples. It is notable for its Rom, antiquities in and near the tn., and especially for a long subterranean th., and especially for a long subterranean aquaduct, which still supplies the industries and fountains of I, with water. There is, too, an anet. Rom. bridge outside the th. Nearby is a chapel to SS. Cosmas and Damian.

1. Is identical with the anet. Samnite th. Esernia, which was consequently added to SS. quered and colonised by the Roms, c. 260 B.c., and the massive polygonal walls which form the basis of the existing walls in nearly their entire circuit are attributed overthrew the cathredral besides doing other damage. In 1799 the tn. was stormed by the Fr. and in 1860 it was sacked in a Bourbonist revolt. I. is the sent of a bishoppic. It has manufs of woollens, pottery, and tiles. In the Second World War some damage was sustained by the churches of S. Maria della Benedettine and S. Maria della Monache, but the Rom, bridges were, for the most part, spared and the tn. suffered companatively little. The Gers., however, stole the entire coin collector. Pop. 15,000.

Isla de Pasqua, see EASTER ISLAND. Isla y Roja, José Francisco de (1703-81), Sp. satirist, Jesuit priest and a famou-preacher, h. at Villa Vidance, Leon. Lampooned the ignorance of the Sp. priesthood in a novel entitled Historia del famoso predicador Fray Gerundio de Campuzas. The book was prehibited (1760) in consequence of the storm of protests raised by the victims, but he pub. a second part in 1770 unknown to his a second pitch in 170 unknown to have superiors. He also completed, shortly before his death, the trans, of Gil Blas into Sp. In 1830 his Obras Escopidas came out as vol. xv. of the Biblioteca de Autores Españoles. With the other Jesuits he was hard from Spain in Autores Españoles. With the other Jesuits he was bed from Spain in 1767, and went to Bologna, where he lived until his death. See B. Gaudeau. Les Precheurs burlesques en Espagne au

XVIII' Siècle, 1891.

Islam (Arab Islam = 'surrender to God'), virtually the Mohammedan faith (see MOHAMMEDANISM). The term is used in a broader sense to refer to the general features—philosophical, religious, artistic and social—of Mohammedan culture. e.g. and social—of Mohammedan culture, e.g. in Nietzsche's Antichrist, Renan's lecture Islamism and Science (pub. Eng. trans., 1896), etc. 'Moslem.' 'Muslim,' or 'Mussulman' (derived from Arabic salama, meaning 'to submit': ef. salaam), as a substantive, means a Mohammedan and, as an adjective,' of or pertaining to the Mohammedans; and all Mohammedan communities of the world of Islam are Muslim or Moslem communities. The salient feature of I, is the remarkable homogeneous unity of the Moslems, a unity which is founded on their faith and on the language in which the Koran was on the language in which the Koran was written. The essential world of I. embraces Egypt, the Auglo-Egyptian Sudan, Saudi Arabia, Iraq. Syria, Palestine, Transjordan, Aden, Libya, Algeria, Tunis, Morocco and Zanzibar- all Arab countries; and the non-trab countries, Persia, Afghanistau, India (which has 75 million Muslims) and Mulaysia. These countries do not exhaust all the existing Muslim pop.; they represent, however, most of the independent Muslim lands and the most important Muslim communities, that generally speaking, oreidental in-There are also numerous Muslim communities, that generally speaking, oreidental in-munities in various European countries, methods, customs, and theories have been e.g. there are estimated to be 25 million accepted for which there was no favouring Moslems in Soviet Itussia, in Yugoslavia historical and cultural background. Re-(1) million), in Albania (about 800,000); cognition of the superiority of W. science and, among non-European Muslim companies in duced many Arabs to countries, are large elements in Liberia break with belemic tradition. This back

modern Constitution, Turkey officially no longur regards herself as an Islamic state, Islamic teaching being forbidden in schools, while even instruction in Arabic is not tolerated. The religious orders in Turkey have been closed and religious exercises outside the mosques prohibited; though individual Turks are no doubt still loyal to the teachings of Mohammed and the mosques in fact still attract large congregations. Probably so attract large congregations. Probably so remarkable a unity as characterises the Moslem faith would never have been achieved if the influence of I. had been restricted to the religious aspects of Musthe life. But unlike Christianity and other monotheistic faiths, I. supplies a political and social standard as well as a religious code. It provides standards for legal, social, and political conduct, and regulates the life of a Moslem throughout the entire complex of his economic and perthe entire complex of ms economic and personal activities. Hence I, overrides the racial, national, or social distinctions in Muslim communities and in fact everything that savours of caste or class distinction is anotherna to true I. The tinction is anotherna to true I. The political consequences of this Muslim unity in the world's affairs, or, in other words, the existence of a homogeneous Muslim Empire began to lessen with the deeline of the Caliphate. The Ottoman Empire did indeed provide a temporary if artificial and materialistic basis of unity, but it was only after the beginning of the present century that the idea of Muslim unity began once more to exercise an inunity began once more to exercise an increasing influence upon international ahairs. Today the Muslim peoples of Exppt, Iraq, and Persia area political force in modern affairs. Though the world of I. has, to a considerable extent, felt the impact of W. ideas, it is still governed essentially by religion. The extreme ascetteism of the Wahabi kingdom of the Nachabi kingdom of the backet is an elegant way of this tarti-Sa'ud is an eloquent proof of this truth. Nothing, too, has been a stronger bulwark against Nazi influence in the Muslim wold than the faith of I. Ever in Persia, where, during the late Shows reign, religious practices were not eccouraged, the Constitution of 1925 maintained a lunited religious-Islamic character and with the abdication of shal. Reza Pahlevi in 1911 religious restrictions were relaxed. Many of the Muslim peoples dispersed throughout the world have become assimihated to the political and cultural me of their country of adoption. This is especially true of the Arab immigrants in America; but, as indicated above, there remain more than a dozen Muslim, or partly Muslim, countries whose chief inspiration comes from I. and Islamic traditions. But it cannot be denical that generally speaking, occidental indicated has been dangerous for I. W. lated to the political and cultural life of their country of adoption. This is especand, among non-kuropean Muslim com-and munities, are large elements in Liberia, China (over 20 million), and Madagascar (700,000), etc. Turkey is not included, the Near Eastern countries; but the re-for, by the Law of April 10, 1928, of the laxing of hereditary ties with I. in such

advanced countries as Egypt and Syria into two classes, continental and oceanic, has also been ascribed to the antagonism | The former are the result of the submerof Arab youth to the narrow-mindedness of the ulcma (doctors of sacred law), whose interpretation of 1. was retrogressive and opposed to all scientific advance. Yet this estrangement from I. is often only slight and many of the most advanced Arab thinkers of today realise that, without I., the future offers only poor prospects to those peoples whose spirit and intel-lectual life depend fundamentally on the Muslim faith. In the last two decades political nationalism has been the domi-nant factor in the political life of the specifically Arab countries. But even this nationalism has been and still is coloured by I., and indeed Arab nationalism, the ultimate objective of which is pan-Arabism (q.r.), could never be divorced entirely from I. Pan-Islamism, however, nomains a mero dream, as remote from probability as a phad waged in all the Islamic countries of the Near and Middle E. Prominent Islamic writers and thinkers, like the Persian Multahid, Sheikh Al-Zinjani, Dr. Taha Hussein, onetime Dean of the Faculty of Letters in Cairo Univ., and Dr. Yahva ad-Dardiri all tend to see in a return to the Koran the chief remedy for Araballs and their 'moral

attend to see in a return to the Koran the chief remedy for Arabills and their' moral anarchy.'

Islamabad, tn. in Kashmir, India, on the R. Jhelum, the original cap, of Kashmir, but now of secondary importance. It possesses an old summer palace, a beautiful mosque, and a shine. Close to it are the sulphur springs of Anant Nug, falling into a reservoir full of sacred fish. Chintz, cotton, and woollen goods are

manufactured, and the famous Kashmir shavis. Fop. 10,000.

Island (Old Eng. ieg. isle, and land), piece of land surrounded by water, but exclusive of continents (see Continent). Greenland, (less than one-fourth the size of Australia). Creeniand, tiess than one-fourth the size of Australau, is presibly an ice-bound archi-pelago. New (unnea, with an area of 303,000 sq. m., Borneo (284,000 sq. m.), Madagascar (227,000 sq. m.), and Sumatra (162,000 sq. m.) are the next largest is.; Great Britain comes sixth on the list, with 303,000 sq. m., Borneo (224,000 sq. m.), and Sumatra (162,000 sq. m.) are the next largest is.; separated from Jura by the sound of I. Great Britain comes sixth on the list, with Arca 150,100 sq. m. The lochs an area of 83,700 sq. m. Is. may be divided of Grulnart and Indal penotrate so deeply

gence of a coastal range, or may have been formed by the sea cutting through the neck of a peninsula, or the cuting back of an inlet until a piece of land is cut off. In all cases, except Madagascar, these Is. are connected with the mainland by a con-tinental shelf, and their flora and fauna are similar to those of the adjacent centinent; similar to those of the adjacent combinets; for example, the is, of the W. coast of Scotland bear this relation to Great Britain, which itself bears the same relation to the continent of Europe. They may be classed according to their structure of their beat of the beat of the continent of Europe. ture, if they be solitary, as Iceland; in chains, like Japan; or in archipelagoes, as in the Ergan. New Zealand, in structure is usually associated with areas of continental dimensions, and, for that reason, it is often regarded as an 1, of the continental type. It is, indeed, a minia-ture continent and too isolated to be spoken of as adjacent to Australia or to any other continental mass. Oceanic is, rise abruptly from great depths, and show no geological continuity with the main-land. They are due to various causes, and may be either 'volcame,' due to the gradual rising above the waves of submerged mountain peaks, or to a violent volcame upheaval of the ocean-bed; or coral is., due to the gradual agglomera-tion by the action of the water, or the active building of the corals themselves, or the skeletons of marine organisms (see Coral). Numerous submarine is. have been discovered which only require volcanic action or the deposition of sediment to rise above the surface of the ocean. See also GEOGRAPHICAL DISTRIBU-TION

Islands, Bay of, bay on the W. coast of Newfoundland, in the Gulf of St. Lawrence, forming an estuary at the mouth of the Humber R. It is famous for its beautiful scenery, and is within easy reach

of good tishing and hunting.

Island Scots, body of Highlanders, descendants of Somerled, there of Argyll and lord of the Isles, who settled in Ireland, establishing themselves in the mis, of Uster, plundering the surrounding country. The earl of Sussex made an country. The earl of Sussex made an attempt to subdue these Macdonalds (MacDonnells), but failed. They were finally defeated by their former ally, Shaue O'Neill, who took their leader, Sorley Boy MacDonnell, prisoner. The Eng restored the MacDonnells, and Shane O'Neill was slam by one of the High-landers in a brawl (1567).

Islandshire, part of Northunberland, England. It was at one time part of the co. of Durham; it includes the Farno Is. and some distancer Berwick-on-Tweed.

Cuba, So m. of Batabano, with an area of 1180 sq. m.; it has some minerals and quarries; but the islanders are chiefly engaged in rearing enttle, and cultivating grape fruit and winter vegetables. Pop. 10,000. (2) Also an is. dependency of New Calcdonia, 30 m. to the S.E. with an area of 58 sq. m. and a pop. of about 600.

Isle of Thanet, see THANKE, ISLE OF.

Isle of Wight, see Wight, Isle or. Isles, Lord of the, Scottish title claimed by the descendants of Somerled (d. 1161), thane of Argyll. Somerled was a des-cendant of Colla-Uais of Ireland. He sucoccided in driving the Norsemen from Argyll and the W. Isles, establishing himself as an independent prince; his lands included Kintyre and the Isle of Man. His descendants maintained themselves in the same manner. In 1111 the Donald in the same manner. In 1111 the Donald of the Isles, who had become very powerful by his fleet and large army, claimed the earldon of Ross through his wife, including the Isle of Skye. The earl of Mar, with an army of Lowlanders, marched against him, and Donald was defeated with great loss at the battle of Harlaw in Abordeen. The earldom then reverted in Abordeon. The earldom then reverted to the crown (1121), but was restored by

and thus eleventh earl of Ross. John Macdonald, fourth lord, committed treason, and was deprived of his carldon (1469). In 1502 Ponald Dhu, grand-on of John, was proclaimed king of the Isles, and led a revolt against Jumes IV. Ho was defeated and fied to Ireland. Since 1469 the title of 'Lord of the Isles,' has belonged to the Prince of Wales. The title 'Lady of the Isles' is sometimes applied to the wife of Rapan Nucleus ideas. plied to the wife of Baron Macdonald, descendant of a half-brother of John of the Isles. It is, however, a matter of keen controversy. The house of Somerled surcontroversy. The house of Somerled survives in two branches, that of Baron Mac-

douald of the Isles and the Macdonnells, earls of Antrim in Ireland.

Isles of the Blest, or Fortunate Isles, in thical group of is, on the edge of the W. Ocean, peopled by the blessed mortals who were 'never to die.' Sev. nations seem to have believed in this myth, Tradition places the Amenet (pleasant place of the dead) of the early Egyptians somewhere in the W. Ocean; the Babylonians be-lieved in an i-le of the blessed encreted by four rivs. The Gk. belief expressed by Homer appears to connect them with the Elvain Fields. Plato describes in his Enmons how solon was told by Egyptian priests of a country larger than Asia Minor, which was overwhelmed by the sea. This was known as 'Atlantis,' and the surviving is, were termed the Fortunate Isles. A very early tradition suggests than an unrecorded voyage to the Canary Isles and Maderia may have gained these places this mythical name. The Celtic Avalon of King Arthu and St. Brendan's Is, were represented as blest with summer all the year round, and 'therefore fortunate.' There are also legends of Lyonesse off

to any all and many others.

Isle-sur-la-Sorgue L', tn. in the Vauchus dept. of France, 12 m. E. of Avignon, pattic-quely situated on the Sorgue, a trib of the Rhone. The inhabs, are cheffy engaged in the textile industry.

Pop. 6500.

Ismay, Lionel Hastings, first Baron (b 188) Brit soldier commissioned in 1907 He served on the Indian frontier and in the I ust World War in Som illiand, where he was twice mentioned in despatches He was it the Staff College Quetta, 1922, in lat the Army Headquarters India in Willingdon Viceroy of India, 1931-33, and ceretary to the Committee of Imperial Define 1938. He was deputy secretary to the War Chinet from 1949 and chief of Stall to the Minister of Define 1949. fenc from 1940

Ismay, Thomas Henry (1837-99), Eng Ismay, Thomas Henry (1007-201), Mag-shil (wher b in Cumberland He started a shipbuilding business of his own at 11011 oil, after serving a short term of apprenticeship and engaged particularly in th Australian trade. In 1867 he en tered into partnership with Wm Imrie, and formed the Oceania Steamship Company Later he became chairman of the pany Later he became chairman of the White Star I inc, and a ducctor of many

ismet Pasha, see INONC.
Ismid, or Isnikmid (anct. Nicomedia),
tn. in Asiatic Turkey, situated at the head of the gulf of the same name. It is connected by rail with Huidar Pasha, Angora, Konia, and Smyrna, and contains a fine sixteenth century mosque. It is the seat of a Ck. metropolitan, and an Armenian archbishop, and was formerly the anct. seat of the kings of Bithynia, but it now retains little of its former dignity. Its port, Darijeh, is about 31 m. distant, and here the Anatolian Railway Company have built docks and a quay. Pop. about18,100.

Isnik, see NICAA. Isobar, line drawn on a chart joining places of equal atmospheric pressure. The chart may represent the earth's surface or a surface at a constant height above the

carth.

Isochronism, that property possessed by an oscillating system, e.g. a pendulum, which oscillates in equal times, however great the vibrations may be. This can great the vibrations may be. This can only be possessed when it moves in a cycloidal are. Because of their practical I., musical instruments such as tuning forks, organ pipes, and stretched strings give notes whose pitch is independent of

the intensity. As Sound: Reasticity. Isodinal Strata, those which dip in the same direction on both sides of the axis of curvature. They were doubtless pre-ceded by ordinary symmetrical folding, after which the vertical axis became tilted and gave a sigmoidal fold; in many cases continued strain has caused the middle limb to be clongated and fractured.

Isoclinic, and Isogonic. When a magnet is suspended treely from its centre of gravity, and allowed to come to rest, it is found that it takes up a definite position at a given locality. The vertical plane passing through the axis of the magnetic scalled the magnetic meridian. The angle, between the plane of the geographical meridian and the magnetic meridian is called the declination. This varies at different points on the earth's surface. Isoplaces on the earth's surface at which the declination is the same. The angle made by the axis of the freely suspended magnet with the horizontal is called the inclustion or dip. At the two magnetic poles the dip is 90°; at the magnetic equator its value is zero. It has intermediate values at places between the poles and the equator. Isoclinic lines are lines con-necting those places on the earth's surface at which the inclination is the same.

Isocrates (436-338 B.c.), colebrated Attic orator, b. at Athens, where he was taught in the schools of Gorgias, Prodicus, and Socrates. He was prevented by his timidity from ever speaking in public, but wrote orations for others. He started a school of rhetoric at Chlos, but subse-quently moved to Athens, where he had He started a 100 pupils. He was a personal friend of Philip of Macedon, and this friendship for a time kept off war. When the Athenians were defeated at Churonea in 338, I. was so overcome with grief that he put an end to his life. Twenty-one of his orations and

eds. of his extant writings are by Baiter and Sauppe, 1856; Benseler and Blass, 1878 and 1913-27; and Mathieu-Bre-mond, 1928 ff. See Sir R. C. Jebb, Attic Craters, 1893; G. Schmitz-Kahlmann, Dus Beispiel der Geschichte im politischen Denken des Isokrates, 1939. Isocyanides, Isonitriles, Carbamines, or

Carbylamines, class of carbon compounds, isomeric with the cyanides, but containing the group -NC, in which the alkyl group is united to carbon through a nitrogen atom. They are extremely poisonous, have a dis-gusting odour, and on hydrolysis with a mineral acid yield forme acid and an amine. They cannot be hydrolysed by alkalis, and are of interest as possessing a bivalent carbon atom, the normal valency of carbon being 4. [. are made by heating a primary amine (e.g. aniline) with chloro-form and alcoholic potach. See NITRIDES. Isodimorphous Substances. Two sub-

tances are said to be isodimorphous when they each crystallise in two distinct forms (i.e. are dimorphous) and in each of their dimorphous forms are isomorphous. example, arsenic and antimony trioxides each crystallise in two distinct forms which occur naturally in minerals, but each form of the arsenic compound is isomorphous with the corresponding form of the anti-mony compound. Thus, As₂O₃ in arseno-lit (cubic), in claudetate (orthorhombic); St. O, in senamontite (cubic), in valentimite (orthorhombic), A. and S. are isomorphous, so also are C. and V. Again, calcium carbonite is dimorphous, crystalising as calcite and aragonite. Lead carbonate (it the mineral cerussite) is isomorphous with aragonite, but no form is known which is similar to calcite. Clistals of calcite often contain, however, carbonate of lead (plumbocalcite), which shows that this latter may also crystallise in the same form as calcite, although as yet it has not been discovered as a distinct mineral. Calcium and lead carbonates may therefore be said to be isodimorphous.

Isoetes, single genus contained in the order Isoetacere, which flouristes in temperate and tropical lands and consists of nity aquatic or semi-aquatic plants. Sev. of the species are known as quillworts on account of their grass-like; openrance, and I. lacustres is known in Britain as Merlin's grass. The genus resembles Selaginalla in its characteristics.

Isola, tn. in the Free Ter. of Trieste, 9 m. S.W. of Trieste on the S.K. shore of the gulf. It is noted for the famous I.

the gulf. It is noted for the famous 1, whice. Pop, about 10,000.

Isola Bella and Isola Madre, two celebrated is, of the Borromean 1s., Lake Maggiore, N. Italy.

I. M. is the larger and has long terraces and an old palace.

Isola del Liri, com. of Italy, prov. of Caserta, situated on an is, formed by the R. Liri, and 5 m. s.W. of Sora. It has machinery works and nature and woollen

machinery works and paper and woollen mills.

Isolationiam, see United States of

AMERICA, History.

Isomerism, term introduced by Berzellus to denote the phenomenon of the existence of two or more different subnine letters have come down to us. The stances whose molecules consist of the

same number of the same atoms. there are two compounds, viz. ctyl al-cohol and dimethylother, which both have molecules consisting of 2 carbon atoms, 6 hydrogen atoms and 1 oxygen atom. The existence of isomers is explained by the different ways in which the atoms are arranged in the molecules. Thus ethyl alcohol is CH₃-CH₃-CH₃, The first case objective is CH₃-CH₃. served was that of ammonium cyanate and urea (Wohler, 1828), both of which have the formula CON, H4; the former compound, however, is of the structure NH,-O-C≡N, while the structure of urea is $O = ((NH_2)_1$. Stereoisomerism is I. which cannot be explained on the usual plane formule, but necessitates consideration of all three dimensions of the molecule. It is frequently accompanied by optical activity, i.e. stereoisomers often exert a rotatory effect upon the plane of polarisation of polarised light. Dynamic isomerism or tautomerism is the name given to the reversible chemical transformation of one isomer into another. Dynumic isomers usually exist as an equilibrium mixture of the two isomeric forms; thus ordinary ethyl acetoacetate is a mixture of a compound

CH. CO CH. COOC, II, with the isomeric substance CH. · C(OH):CH · COOC. H.

Isomorphism (Gk. ίσος, equal; μορφη, rm). Two substances are said to be truly isomorphous when their crystalline forms and chemical compositions are similar. Mitscherlich discovered that the phosphates and arsenates of sodium crystallise in the same form, and from this and other observations he formulated, in 1821, his 'law of 1.,' which states that substances of similar chemical composition exhibit the same crystalline form. Since. however, a large number of similarly constituted substances are now known which crystallise in distinct forms, the statement crystalise in distinct forms, the statement requires modification. Among truly isomorphous substances may be mentioned the following: the alums, zinc sulphate, ZnSO, 7H,O; and magnesium sulphate, MgSO, 7H,O; ammonium chloride, NH,Cl (in which the group NH, behaves as a metallic radicle); and potassium chloride, KCl, etc. The converse of Mitscherlich's law by no means holds. Thus we find the diamond C: magnetite we find the diamond, ('; magnetite, Fe₀O₄; and the alums, which exhibit no chemical analogy, crystallising in octahedra. These substances are not truly isomorphous, but are said to be isogonous.
The power to form 'mixed crystals' or 'overgrowths' is generally accepted as a criterion of I. Thus, magnesium and zinc sulphates crystallise together in all proportions in the same form as a crystal of either constituent, and if a crystal of chrome alum be immersed in a solution of common alum, the new layer of the latter will be deposited regularly on the old crystal of the former. The law of I. is the most important generalisation in the science of crystallography, and has proved of much use in settling the atomic weights of sev. elements.

Isonitriles, see under NUTRILES.
Isonzo It. riv. which has its source at Monte Terglou in the Julian Alps and drains into the gulf of Trieste in the Adriatic. It is about 75 m. in length, is Adratic. It is about 75 m. in length, is deep and rapid, and waters a rich alluvial plain in Friuli, including all Gradisca and Gorizia. In its upper course it unites with the Natisone. Its tribs., mere mt. torrents, are the Idria, Torre, and Vippaco. At the tn. of Gorizia it is about 10 ft. above sea-level. It was the seen of the defeat of the barbarian king Odoacer by Theodoric in A.D. 493. In the First World War, being in what was then Austrian ter., it was early the obthen Austrian ter., it was early the objective of the Its., whose armies reached it in 1915, their aim being mainly directed to the achievement of their traditional irredentist dreams. But this was all they were destined to accomplish for some time, for in 1916 the Austrians weakened the 1t. hold on the I. valley by a determined advance in the Trentino. The 1ts., however, aided by Brussilov's drive on the E. Front (see Brussilov, Alexei Alexeie-vich; Russian Front (First World WAR) launched a strong counter-offensive along the riv. and, on Aug. 1, the first day of the move against Gorizia, carried the heights on the W. bank overlooking the tu., storming the summit of Monte San Michelo and, after sev. more days' fighting, capturing all the heights W. of the riv. together with Gorizia. They were now appreciably nearer their goal of emancipating Triesto: but thereafter Cadorna, under whom these successes had been won, suffered his historic defeat at Caporetto (see Caporna; Chioretto). No further fighting of decisive importance took place on the L, the issue being decided on the Playo.

Isopoda, name of an order of Malacostracan crustaceans, characterised by a broud, flattened body, with no carapace, and by lamellar legs, whose inner rum serve as branchle, situated on the abdo-men. They have many features in common with the Amphipoda, as, for instance, the sessile eyes and the firm, calcareous covering of the body, but the abdomen of is stuated posteriorly. Some of the larger species inhabit the bed of the sea, others are inhabitants of fresh waters, and many are parasitic on the bodies of fishes and crustaceans. 1. are divided into two sections; under I. Genuina are grouped Omiscoidea, wood-lice, the only terrestrial forms, Asellota, Phryatoleedea, Valvifera, Flabellifera, and Epicaridea.

Isoprene or Methyl - butadiene (CH₂: (Me · CH · CH₂), liquid which boils at 36-37° C. It is a member of the olefine series of hydrocarbons, and can be obtained by the distribution of caoutchous or synthetically from isoamyl alcohol (which is present in fusel oil). I, has attracted much attention became it may readily be converted into substances resembling rubber, but synthetic rubber as hitherto made is generally inferior to, and

more expensive than, the natural product.
Isopyre, greyish or black mineral, consisting of silicates of lime, iron, and alumina.
It has a vitreous lustre like obsidian.

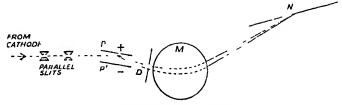

Isoquinoline, see LEUCOL.

Isotelus, name of a genus of trilobites found in the calcareous strata of the U.S.A. Isothermal Lines (from the low, oqual, and θερμος, heat), also called Isotherm, connect places on a map where the tempor on the earth's surface is the same at any given time at the sea-level. Isothermal lines to the same at any given time at the sea-level. Isothermal charts afford a ready means of studying charts ahord a ready means or knodyna relative temperatures and may be drawn to indicate the average monthly, scasonal, or ann. temps. They show how temp. is affected by land and sca.

Isotopes. The word isotope was intro-duced by Soddy to embrace those in-stances where two or more individuals of

different atomic weight occupied the same position in the Periodic Table. I. have identical atomic numbers (excess of protons over electrons in the nucleus-see ATOM), whilst the number and distribu-

covery of I. of very general occurence. The elementary gas to be examined is subjected to an electrical discharge (see Discolarge Tubes) under high vacuum, whereby some rays carrying positive charge result. These rays are allowed to pass through a slit in the cathode to an observation chamber boyond. The diaphragm D selects rays which have been phrigin D sciect rays which have been deflected by the electrical field imposed by the oppositely charged plate PP, and they are then brought to a focus on the photographic plate N by the operation of a magnetic field introduced by the electro-magnet M (see Fig. below). A mass spectrum depending on mass alone is ob-tained at N. Each isotope gives a record of its presence, and its atomic mass can be found. Thus, chlorine contains two I. of atomic masses 35 and 37 mixed in such ATOM), whilst the number and distribu-tion of electrons outside each nucleus are the same. For practical purposes, their chemical and physical properties agree. The same one part in 1000) except

POSITIVE RAY SPECTROSCOPE

Though in the case of the isotopes of hydrogen (1.008). Aston later made a hydrogen, viz. hydrogen itself (atomic more powerful apparatus, and has obweight 1), deuterium (atomic weight 2), and tritium (atomic weight 3), the chemical upossibly physiological properties are noticeably different.

Separation of Isotopes.—Chemical

Ordinary lead (atomic weight 207.2; methods in general are unsuitable, but atomic number 82) is isotopic with radium tother methods such as distillation, C (atomic weight 206.05), a disintegration evaporation, diffusion, effusion, and centri-G (atomic weight 206.05), a disintegration product of uranium; with radium 1) (atomic weight 210), a product of the dis-(atomic weight 210), it product of the disintegration of radium; and with thorium D (atomic weight 20s). Richards obtained the value 206-08 for the atomic weight of lead associated with the mineral elevoito, whilst Honigschmid reported 207-9 for lead from thorito deposits. During radioactive changes (see Radio-Activity) the effect of an element losing a β particle (an electron of negligible mass) is to shift it one place to the right in the Periodic Table, whilst the loss of an a particle (identical with the helium nucleus of four protons and two electrons) shifts if an element loses two β particles and one a particle, a new element is formed occupying the same position in the Periodic Table (an isotope). Again, an atom of uranium (atomic weight 238) can lose eight a particles and six β particles giving

jugalisation have been more such ssful, in particular cases—e.g. manium 238 and aranium 235—separation has been effected on a comparatively large scale.

Most elements have isotopic forms, and some (c.g. xonon, tin, and cadmium) have

Isotropy (Gk. ίσος, like, τρόπος, character), condition of having uniform characters throughout. The term is especfally applied, in physics, in connection idly applied, in physics, in connection with substances or media in which elastic stresses are propagated uniformly in all directions. Such substances are termed instropic, and the possession of the quality supposes that the molecular structure of supposes that the molecular structure or the medium is homogeneous throughout its substance. Non-homogeneous media, on the other hand, are known as ariso-tropic or heterotropic. In crystallography, I. is a property possessed by certain crystals of the cubic system which have an element of atomic weight 238 - 4 \ an element of atomic weight 238 - 4 \ as = 206.

The Positive Ray Spectroscope (Aston, 1919) has been invaluable for the disbryology, is applied by Pitiger to that

condition where there are no predetermined axes

Israel (God fighteth) name given to the patriarch Jacob on the occusion of the firmous incident related in Gen NAM and the name also come to be given to the tribes of the Hebs collectively and as a nation In later days is will be seen the name was restricted to the \ kingdom of I proper, while the \ kingdom was known as Judah (Fer the modern secular state of I, see the following article 1 It is proposed in this article to deal with the hist of the Hebs from the time of the Patriarchs to the full of the temple (For Patierchs to the full of the temple (kor their hist since that date see I ws) The accounts which the Hebs the inselves in later days give of their engine are con t uned in the carly books of the Bible, and these are largely based upon graune tradition. But, as will be seen from the articles on the separate books they under went much editing in the course of years always with a view to securing their greater conformity to a scheme and to in then creasing their did acta character More over, they show a general tendency to imagine later conditions is present in primitive times. The in extens of the Israelites were certain of the pastoral tribes having their abole in the wild tracts to the S and F of I il stine, of S Semiti (and probably of Arami an) stock Their nearest kinsmen were I dom, Am mion, and Moab About 2009 a c they migrated under their tribal chaf, Abraham, from Haran in Mesopotamia into the land of (ansan Here the tribes con timued to lead a pastorial life and ulti mately, in the time of Jacob, a famine in the land of (ansan led to a fresh inigration into Egypt In the Biblical narrative the whole twelve tribes are mentioned as taking part in this migration, but it is important to notice that the movement is (c. 1020 BC) to the exile—Saul soon

especially associated with the name of Joseph, that is to say, the aucestor of the chief of the N tribes which formed I proper Here they obtained leave from Pharach to dwell in the land of Goshen, where their continued adherence to their own customs and pastoral life led them to be accounted barbanans by the cultured lu I gypt they were sub Lgyptians I gyptains to I gypt they were subperted to repressive measures, induced by
a feir lest they should ally themselves
with I gypt's focs. Then there arose the
figure of Moses, the great founder of both
the religion and the law of 1. Moses was
the som in law of a priest of Midian, and at Sinal, the int of God he heard Horeb / the call of Yahwah (Ichov th), his father's God to deliver I from the bondage of He had much difficulty in rousing FEVPt the enthusiasin of those he was sent to save but ultimately the work was accom-plished by means of the nuracle wrought by Y much on behalf of his people. Moses led the Israclites to Mount Sman, and herea coverint was salemnly made with Yah with and the new religion of I was minimited bised up in a conception of the Dorty more spiritual than any which had set been conceived from Smai they pessed to the work of conquering (mein for which they had set out attempt made it kidosh on the 5 frontier was no necessful and they returned to the wildciness for a time which according to the Libbe il nuritive made the whole peried forty years. During this time Moses died and it was under Joshu'i that the entry into Palestine was finally made. Details of this are given in the Book of Jo hu i

The Isrulites now settled down to an and commercial life entering in 8 2) 10 many cases into treatics of friendship with then (mainite neighbours | this weak ened the bonds of union between the varions tribes and might well have led to the ultu ite fusion of the races This was treverted by the use from time to time of the shofetim, or Judges, who roused the dyn ardour of the tribes lifteen such her s we named in the Book of Judges After to-hua comes a long period of falling in it relieved by the occasional rise of a deliverer Among the rest of the the most funous are Deborah

Jules the prophetes, and Banak, Cideon, leghthan Samson and the prophet Smuch During this period I does not corn it all into contact with the great kined his of the Last, and their conducts were rather with their own kinsinen, the Manufact Ammontage and also the Medutes, Ammonites Manuales The Philist and also Minimites The Philistines were among the most powerful opponents of I, and it w) while suffering under defeat from this face that the Jows cried for a king, not only that by this centralisation of authority mere he idway might be made against the my iders, but also that they might be like all the other nations. Samuel the prophet, who was at that time their leader, reluctantly consented to accede to then desires and chose as their king Saul, the son of Kish

proved his fitness for the new position which had been given to him by brilliant of Jabesh Gilead, after which he was or Japes thend, ander which he was solemnly problemed king at fellgal, and then by a decisive victory over the Philistines at Micmash Here the victory widuo chieffy to the bravery of Saul's son Jonathan and six hundred Benjamites who a companied Saul who was a member of their tribe Saul was himself a great and his next compaign wis warriot, and his next campaign wis against the Amalckites who had long been troubling Jud it. He was however, given to fits of madness, and to quiet him in these, David the son of Icsse the Both lemite, a cuming player on the harp was brought in to play to him. His pre-sence, however had a bad effect on Saul and this was increased by David's rapid rise in popularity His comage and suc rise in popularity and to make him his cess in war had led saul to make him his atmour bearer, and his intimate friend ship with Jonathan, the king's son, rendered his position such as to cause saul's deted his position such as to cause Saul's jealousy Morrover he was the king's son in low Hence Saul decided to slay David, who in consequence became an out law, ultimately having his centre of opera-tions at Ziklag. The resolutely refused to enter into operations of in 11 and events were so shaping themselves that it was possible for him to return in power on 5 and 5 death. This occurred at Mount (a) box and David on he tring of it, unmedi ately went up to Hebion with his followers and was anomited king of Judah. while Abner Saul's leading general, had taken Saul's son Ishbild to Mahanaim and there had him crowned as king of I War in consequence broke out between I and Judah, in which the b Lingdom was stadily victorious. On the death of Abnet and Ishbell, the crown of 1 was offered to land who immediately took up the work of uniting the two dies. He transferred his cap to Ichus (Jerusalem) the great hill fortress of the Johnstes whose position had butherto constituted than a better in the constituted. them a birrier between N and S, and thither he brought the ark. But th Philistines, though they had acquiesced in David Sovercamty of Judah could not acquiesce in this extension of his power and war resulted. In a succession of willout conflicts Divid secured the free dom of his kingdom and pushed it hound tries in the \ \to Dan, \sigma to Beci sheba, and \W \to the Pha inclan frontier The L boundary was continually chan-ing David's great work, however, was in the consolidation of the kingdon, and his internal administration. To him too the idea of the national sanction. I Jerusalem soon to become the Lemph lo him too owed its incoption. His high poetic and religious faculty is attested by his pailing and by those of the school named from him The crown passed from David to his son, Solomon, whose name is associated

daughter Solomon had espoused mercial treaties were entered into with such in ighbouring monarchs as Hisan of Ivic, in union with whom ships were sent as far as Tarshish (Spain) and Ophir (Saraha V) Solomon now led the life of the ordinary F despot. His court was in ore splended than any other of which we read in the hist of I, but such magnificant could be sustained only by a heavy tay ution. Mutters reached a crisis on the death of Solomon (930 BC). A deputation he ided by Ictoboun, which c me to solution as son Rehoboam, to ask reher from the burdens which his father had full upon the country. There were two ful upon the country. There were two courses open to hun acquissence in his people demands or an attempt to intimidate them. He chose the latter and the immediate result was a revolt of the ten tules of land under Jeroboum, the son of Judih and Benjamin alone were No but left to Rehoboum while I, for the name is henceforth reserved to the N kingdom, made Jeroboum its king

At this point it will be well to make i short digression, and to consider the main points in the religious condition of the Hets. The anct Hebs had no conception of Y thuch (Jeliovah, q t) as the God of the whole earth. He was regarded to the state of the control of the state of the control of the nation though not as the only God who might be worshipped. This latter con-aideration explains the frequency of tho vice the tenants the requests of the filing away of the lens from Jehovah, which would be inexplicable on the hypothesis that they recognised Him as the one God. But the Israeliush conception of the Deity advanced rapidly and as a result their moral ideal was fur higher than that of the surrounding nations on a continued during the period of the ludges though as we have seen, relapses nt i foreign cults were free uent In this ic iod the functions of the prophets, such a Deborth was to bring back the people to the conception of Yahweha the God of their nation to provent in fact, the re-ben of Yahweh being entirely versome ty heithen cults. The in tith con of the remarchy heralded agreet change. Dayid brought his royal sanctumy at Jerusalem it pir minone, and the next reign saw the decretion of the Temple. Its purpose we that here, at certain ann fostiwals, the whole people might gather for a trough least. Though later tradition whole to Moses were customary the in titution of a priestly succession in the inc of Aston, the institution of the her nehr is, in point of fact, post exthe scribers were offered by the head of the nation, clan, or family, or by a prophet When Jeroboam in tituted a new king ion therefore, one of his first acts was to prevent the Israelites from going up to leep the ann festivals at the Temple Ho did this by instituting or reviving sanctuances at Bethel (and Dan?), where he his son, Solomon, whose mane reasociated that its at Bethel and Pairly, where he by tradition with power, wisdom, and set up golden alves as symbols of tahwealth
Now for the first time, I took a prominent place among the great nations of the R., though it is probable that it was in the tetrograde step towards idolatry some degree subject to Pharaoh, whose shown by the creation of the golden

calves. The great period of the prophets was the eighth century B.C., to which belong many of the greatest of the Messlanic prophecies, such as those in Amos ix, 11, Hosea iii. 5, and those in the earlier half of Isaiah. The high spiritual feeling of the age is also well shown in the Book of Deuteronomy, from which Our Lord quoted the two commandments on which hang all the Law and the Prophets. The idea of Yahwehas the judge and ruler of the whole world was now generally accepted, and a still greater development is seen in the emphasis laid upon the moral responsibility of the individual by such a prophet

as Jeremiah. To return now to the political develop-During the two centuries that ment. clapsed between the death of Solomon and the conquest of I. by Shalmanezer, king of Assyria, nineteen kings reigned in the Assyria, nineteen kings regions have kingdom. These nineteen kings may be kingdom. These periods. The regarded as covering four periods. The first period (930-890 B.C.) is occupied in attempts to establish a dynasty and in wars with Judah. It ended in civil strive, from which ultimately energes the new dynasty of Omri, which gives us the second period from 890-813. Its kings, after Omri himself, were Ahab, Ahaziah, and Johoram. The reverses which Omri suffered at the hands of the Syrians were made up for by Ahab. This king was a made up for by Ahab. This king was a great statesman, though the injury his idolatry did to I. is well shown in the Biblical narrative. He formed an alliance with Jehoshaphat, king of Judah, the alliance being cemented by the marriage of Jehoshaphat's son, Jehoram, to Athaliah, daughter of Ahab. The two nations then took united action against the Syrians, with whom, after the defeat of Benhadad II., a treaty was formed. Ahab died in battle at Ramoth Gilead, and in the reign of Jehoram an attempt was mode in union of Jehoram an attempt was made in union with Ahaziah, king of Judah, to retake this tn. Now occarred the rebellion of Jehu ben Nimshi, in which Jehoram and Ahaziah both perished. Jehu founded his dynasty (which forms the third period, 843–740) in a sea of blood. Down to the time of Jehu, the soverentry of Judah had remained in the possession of the house of David (six kings), but on the death of Ahaziah an attempt was made by Athaliah to exterminate this dynasty. Jossi, however, escaped, and after six years was proclutined king by Jeholada, the chief priest. Athaliah was slain and the Davidic dynasty restored. A fresh attack now came from Hazael, king of Syria, who was bought off by Joash. There now succeeded for Judah a time of comparative prosperity and quiet. ters changed with the accession of Tiglath-Pileser III. to the throne of Asyria in 745 B.C. At this time a general confederacy of Syrian states against Assyria was being promoted, but Ahaz, king of Judah, refused to join it. He relied instead, in opposition to the prophet Isaiah, upon friendship with Assyria. Hence the Syrians and Israelites opened a campaign against him, in which they then were joined by the Edonites. Tiglath-Pilesor entered N. Israel in support of Ahaz, and

deported into Assyria the leading inhab. of Galilice and the dist, around. Ite also extinguished the Syrian monarchy, and set up Hoshen as vissal king in I. For some years Hoshea remained submissive, but he was then persuaded to revolt by So. king of Egypt. Hence Shalmanezer IV. marched against him, and for three years besieged him in Samaria. The city was eventually taken by Sargon (722 B.c.), and the chief inhabitants of 1. to the number of 27,290 were taken into Mosopo-tanna and Media. They were replaced by tamia and Media. They were replaced by Assyrian colonists, and these, internaxing with the inhab. of the country, formed the mixed race known as Samaritans. The kingdom of Judah had, after all, survived its more powerful neighbour. Here Ahaz was still king, but he was succeeded a few years later by his son, Hezekiah, who attempted a reform in the religion of the country, which had been much deleased. country, which had been much debased under the preceding kings. Helmangurated a campaign against local sanctuaries and strove to restrict worship to the Temple, In this he was assisted by Isaiah. Judah was still subject to Assyria, and Hezekiah's friendship with Egypt brought him into danger of punishment from Sennacherib, An Assyrian army was, indeed, approaching Jerusalem when it was arrested by a plague. Egypt was, moreover, prepared pagae. Egypt was, moreover, prepared to support Hezekiah, and so Sennacherib retired. On the death of Hezekiah the succeeding princes encouraged the heathen cults in their worst forms, but another and greater reform came on the accession of Result (521 to 2). Competed a seciety. Josah (621 B.c.), connected especially with the finding of the book of the law (see DILTERONOMY) by Hilkiah the priest. Meanwhile the Assyrian empire was breaking up, and Judah came into collision with Pharaoh Necho L., who was desirous of pushing the interests of Egypt. In con-dict with him Josiah fell at Megiddo (608), flict with him Josian reil at ategrado (1918), while Jeboahaz, his younger son and heir to the throne, was carried into Egypt while Nechoset Josiah's eldest son, Johoi-akim, on the throne of Judah. In 605 Egypt became subject to Babylon, and Judah became subject to Nebuchadan enzar II. before 600 B.C. In 598 an attempt to regain his independence was made by Jeholakim, and Jerusulem was besieged. Jeholakim, the boy-king who had suc-ceeded his father, was taken prisoner, and in the following year (597), from which Ezekiel reckons the years of the captivity, the greatest and noblest of the Joss wero deported to Babylon, while Zedekiah was deported to Babylon, while Zedekiah was appointed king over those that remained. In 586 a fresh revolt led to the sack of Jerusalem by Nebuchiduczzar and fresh deportations. There was still no peace, however, for Gedaliah, the Babylonian governor left in charge, was assassinated but the remnants of the Jows fled into Egypt, taking with them the prophet Jeremah.

From the Exile to the Revolt of the Maccabes.—The exile was a distinctly providential step in the development of the Jowish religion. Now, indeed, the true idea of the Messiah first clearly appears in such writers as Deutero-Isaiah, generally allotted to this period. The synagogue

was now instituted and the general conception of the after-life was developed under Persian influences (see HELL). But although those Jews whose minds were fixed chiefly on commerce found them-selves better off in Babylon than in their own country, the idea of absence from the Temple was intolerable to the religious. Hence it was not long before attempts were made to secure a return to Jerusalem. Nothing more is known of the hist. of the return from exile until the reign of Artaxerxes Longimanus (162–125), when a band of some six thousand exiles, under the leadership of Ezra the scribe, arrived in Jerusalem. In 116 the city of Jerusa-lem, was re-fortlied, and the Temple wor-ship re-instituted. To this period belongs the final split between the Jews and the Samaritans, made by the establishment by the latter of a rival sanctuary on Mt. Gerizim. Palestine was affected by Alexander the Great's much through the E., and, on the deteat of the Persians at Issus in 333, it became subject to Gk. rulers. large number of Jews were deported to form part of the pop. of Alexandria. On the subdivision of the kingdom on Alexander's death, Palestine fell to the lot of the Ptolemies, under whom still larger numbers of Jews pas ed into N. Africa. The lot of Palestine was, on the whole, fortunate until the reign of Ptolemy Philopater, when the Jews were much op-pressed. After the defeat of the Egyptians, Antiochus III, incorporated Palestine with the dominions of the Sciencidic (197). deliberate attempt was made under the next sovereign, Antiochus Epiphanes, to stamp out the Jewish religion. Its peculiar rites, such as circumcision and the observances of the Sabbath, were strictly forbidden, while the Temple was dedicated to Zeus, and sacrifices offered there. Thou-sands suffered death rather than give way to such coercion, but ultimately a deliverer arose, who inaugurated one of the greatest and most heroic periods in Jewish hist.

From the Maccabees to the Destruction

of the Temple .- Hitherto the resistance of the Jews had been mainly passive. Active resistance came from the family of Mat-tathias, an aged priest of the vil. of Modeln. He slew a Jew who was offering sacrifice to heathen deities, and slew also the Syrian officer who was supervising. taking with him his five sons, he fied eastward, and guthered round him in the wilderness a great company who would with him take aggressive measures, fighting it need be, even upon the Sabbath itself. The act was a desperate one, and a measure of success was rendered possible only by the internecine struggle for the throne which distracted the Syrians themselves. Mattathias, who was an old man when he commenced the revolt, soon died, handing on the lendership to his son Judas, surnamed Maccabeus, the hammerer, from which his whole family has received the name of the Marcabees. Judas was a great warrior and a fervent believer in his cause. He defeated Apollonius, a prominent Syrian general, and finally, Lysias, the viceroy himself, at Beth-zur. Being now master of the country around the cap.

Judas decided to make Jerusalem the centre of his operations, and hence the Temple was fortilled and re-dedicated. After being besieged in the Temple by the Syrians, in 162 B.c., permission was granted them to exercise their religion freely. But the Maccabees resolved to continue the struggle for political freedom. The secular struggle was to be less successful than the religious. It began well, with the defeat and death of Nicanor near Beth-horon, but this was almost immediately followed by an overwhelming vic-tory for the Syrians at Eleasa, in which Judas himself was slain. The leadership of the party, which was now scattered far and wide, fell to Jonathan, the brother of Judas who was able by skilful diplomacy to secure peace on favourable terms, ultimately being himself made high-priest in 153. In 113 Jonathan was slain in the quarrels for the throne of the selectedar, and smoon, his brother, became leader of the Maccabean party. He fortunately esponsed the cause of Demetrius II., from whom he secured a regignition of Falestme's independence (112). So famous a year was this that it was considered the beginning of a new Jewish era, and from it dates were counted and come were dated. Simon, who was made high-prest in 111, was a wise and prudent ruler, and under him the country enjoyed comparative quiet, and in the one important contlict, that with Antiochus Sidetes, Simon was victorious. But there was still much schemmp and party strite. Ptolemy, Smoon's son-in-law, was striving to secure the supremacy and as a step to this Smon was assassinated. But the crime gained Ptolemy nothing, for the power fell into the hands of Simon's ambitious third son, John Hyreanus, who assumed the high-priesthood in 134 R.C., and with it the sovereignty. The reign of John Hyreanus was outwardly most prosperous, though at the beginning he was hard pressed by Antiochus. Later in his reign (131-104) be extended the Jewish dominious considerably in all directions. The sanaritans were reduced and the Temple' on Mt. Gerizim was destroyed. He further subdued the Galileans and Idameans. During his reign, however, Idumacans. During his reign, however, there is visible the rise into political prominence of the Pharisees and Sadducees. John was led to throw in his lot with the latter of these on account of that opposition of the Pharisees to his family which was to continue throughout the period of the Hasmonean dynasty. On his death, his son, Aristobulus I., succeeded to the throne by the murder of his brother, and regued but one year, during which he reduced the Itureans. He was followed by Alexander Janneus, a warrior prince who almost entirely neglected his sacerdotal position, his chief aim being the extension of his ters. He met his death (76 B.c.)

in a cumpaign against the Arabians.

After him, the high priesthood fell to Hyrcanus, Alexander's oldest son, but all power remained in the hands of his mother Alexandra, who accorded a much greater share in public affairs to the Pharises, But Hyrcanus's younger brother, the

energetic Aristobulus II., angry at his ex-clusion from a share in the gov., raised an army and deposed Hyrcanus. Then, as army and deposed Hyrcanus. Then, as the supporter of Hyrcanus, there arose Antipater the Idumean. This man in-Antipater the Idumean. This man induced Hyrcanus to place himself under the protection of Arctas, king of the Nabatæans, by whose ald Aristobulus was defeated. The Roms. now took a hand in the struggle, and Pompey, in 65 s.c., sent his legate, Scaurus, to settle matters, which he did in favour of Aristobulus. This decision was reversed two years later by Pompey himself. by Pompey himself. Hyrcanus was made high-priest, but the gov. of Judea was attached to the Roman prov. of Syria. In 57 an attempt was made to set Alexander, the eldest son of Aristobulus, on the throne. Alexander was taken prisoner by Gabinius, governor of Syria, and in order to break up what unity remained among the Jews the land was divided into five administrative dist. Aristobulus, who had been taken by Pompey to Rome, now escaped and raised a second ineffectual revolt in 56, and this was followed in 55 by a last attempt under Alexander, which was put down by Gabinius. On the death of Pompey, however, Hyrcanus made his submission to Cæsar. Antipater the Idu-mean then secured for himself the post of procurator of Judea (17 B.c.), while to Hyrcanus was left only the high-priest-hood. Thus ended the Hasmonean dynasty. Autipater also succeeded in dynasty. Antipater also succeeded in making his eldest son, Phasel, governor of Jerusalem, and his other son, Herod, governor of Galilee. But the patriotic Jews viewed with horror this estab, of an Idumman dynasty, and set up Aristobulus's last remaining son, Antigonus, as his rival. Antipater was poisoned and Phasel committed suicide in prison, but Herod invoked the aid of the Roms., and in 37 invoked the aid of the Roms., and in 37 secured Jerusalem. Antigonus was put to death in the same year. Herod carried on the difficult task of ruling Judges by the aid of the Roms., and with the utmost cruelty. On his death the kingdom was divided into totrarchies, ruled respectively by his sons Antipas, Philip, and Archelaus, the last-named ruling Judaa and Samaria. His rule, however, was so cruel and despotic that in the year A.D. 6 Augustus deprised him of his power and sent him into exile. His tetrachy was then attached to the province of Syria Henceforward, except for the brief period from A.D. 11 to 11, Judaea was under Rom. procurators. During these few years it was ruled by Herod Agrippa, whose favour with Claudius secured to him all the ters, over which his grandfather had ruled. On his death there was a period of ruled. On his death there was a period of dreadful anarchy and interaction strict between the inhabs, of Pulestine, which was increased rather than lessened by the actions of the procurators, many of whom were in league with the worst clements of were in league with the worst elements of the pop. From the chaos there rose a fana-tical party known as Zealots or Sicarli (Assassuns). These rose in revolt in the year 70, and a bloody struggle ensued, terminated only by that bloodiest of all scenes, the destruction of Jerusalem by Titus (A.D. 70). See also Hebrews.

Israel, a secular Zionist State in Palestine, the precise boundaries of which remain to be settled. (For the hist. of the anct. Heb. nation, see preceding article.) The state is the ultimate development of the institution, after the First World War, of a national home for the Jews in Palestine through the mandate granted by the Alhed and Associated Powers to Great Britain. The General Assembly of the United Nations in Nov. 1947 approved the partition of Palestine into Jewish and Arab independent states by a majority vote, and a United Nations Commission was entrusted with the duty of partitioning the country (see further under Palestine 1718). The state of I. came into existence on May 16, 1948, on the day following the termination of the Brit. mandate, in confirmation of the Brit. mandate, in confirmation of the brit. mandate, in confirmation of the state followed soon afterwards, and before long his lead was followed by more than thirty other members of the United Nations. On May 11 the State of I. was admitted as the lifty-ninth member of the United Nations. Un May 11 the State of I. was admitted as the lifty-ninth member of the United Nations by a plenary session of the General Assembly which by 37 votes to 12, with nine abstentions, endorsed the favourable recommendations of the Security Council.

The United Nations' partition scheme

divided Palestine into no fewer than eight segments; but the achievement of the segments; but the achievement of the precise application of this scheme was still laifling the power of the United Nations in 1919. Meanwhile by force of arms the Jews had inilitrated everywhere excepting the Jerusalem-Tulkarin-Jenin tilangle and the areas held by them included all Galilice and, in the S., almost all the Negeb. They had also secured Haifa as a reinforcement base; Jaifa had become a Jewish the, so also Nazaroth and Beersheba; while the K. Negeb was occupied by Jewish forces down to the gulf of Akaba. Moreover, though the United Nations' scheme of partition (which I. had accepted) included the new Jewish Jerusalem in a special International Zone, Dr. Chaim Weizmann, the first Israeli president, declared that it was inconcelvable that the city should be placed under 'foreign' rule. Furthermore Jewish

propaganda was already envisaging Jewish settlement eastwards into Transjordan. The net result to the Arabs of the Jewish military successes was that the number of their refugees reached the appailing total of 600,000 including the pop. of Jaffa, Acre, and Nazareth, who fied in panic after details became public of the massacre by Irgun Zwi Leumi and the Stern Gang of the inhab. of Deir Yasin, an Arab vil. near Jerusalem, and the number was further augmented by the forcible eviction of the Arab inhab. of Arab yils, by victorious Jewish troops in

order to make room for Zionist immigrants. Within the Jewish-held areas of Pales-tine the Israeli gov. put into force the plans which the Jewish Agency had worked out in readiness for the termination of the Brit. mandate and by early 1949 the Tel Aviv Gov. had an organised 1949 the 'l'el Aviv Gov. had an organised administration. Jewish courts were functioning; there were Jewish depts, for war, finance, foreign affairs, posts, telegraphs and telephones, raliwars, public works, education, police, immigration, and antiquities; there were two wireless stations—Kol Israel and Kol Hierushalayim (the Volces of Israel and Jerusalem); the full H press appeared, as well as the Eng. Palestine Post in Jerusalem and an Arabic daily nowspaper El Yom (the Ibry) was printed and ed. by salem and an Arable daily nowspaper El Yom (the Day) was printed and ed. by Jews in Jaffa. The State of I. took over three para-military unofficial organisations: el Haganah, a large well-equipped force; the Irgun Zwi Leumi, a smaller body organised on commando lines; and the Stern Gang, a gangster formation specially trained for murder (it was finally proscribed by the laracii authorities). In addition, since the mandate ended a large number of men specially trained in Hunaddition, since the minimus chief a page number of men specially trained in Hun-gary and elsewhere in E. Europe were brought to Palestine and absorbed into the Jewish army. The total Jewish fight-ing strength was unknown but was esti-mated at 100,000 men and women. They were much better equipped and armed than the Arabs and much of their material came from Czechoslovakia. It may be noted here the difficult questions of nationality may arise in W. countries which have accepted the Balfour Declaration (q.n.) and have recognised or will recognise the State of Israel. But no Middle E. country ever accepted the Balfour Declaration and none had recognised the Declaration and none had recognised the Declaration and Note had been also as the second state of the State had the second state of the sec Israeli State before late in 1949. the status of the Jewish communities in the various Arab countries remains to be settled. In Iraq there are 73,000 Jcws; in Egypt, 63,000; in Syria, 30,000; and in Libya 30,000. Now that there is Israeli nationality, these Middle E. Jews have become foreigners; the decision whether they will be naturalised or asked to leave rests with the Arab Govs.

Lisa pioner country, but different from the country but dif the various Arab countries remains to be

I. is a pioneer country, but differs from to the clurgy. The paradox here in other pioneer countries in the fact that present day I. is that of a Socialist the cap, required for the absorption of the country under clerical sway, which may new immigrants into its economic life has been supplied not from foreign loans the fact that its herees are still the Probut from the immigrants' own assets and from the donations of world Jewry. Thus the fact that its herees are still the Probut from the donations of world Jewry. Thus while this state of things may last for I. has hardly any foreign indebtedness and is some years the young native generation,

has a credit balance of cap. The rate of economic progress in I. will doubtless con-tinue to be determined by immigration and cap. importation, and everything scens to indicate that after the return to normal political conditions Jewish private Cap. will be invested in I. on a large scale. Jewish industry in I. was a creation of the immigration from Central Europe which began about 1933 and made great advances during the Second World War. Thus the diamond industry began during the war and great quantities of cut stones were exported to the United States. The chief articles of industrial export, besides polished diamonds, are Dead Sea chemicals petroleum products, artificial teeth, and soap. The export industry of citrus concentrates is steadily growing. Olives, mostly cultivated in the hill areas, form the next most important crop. Vegetables are grown extensively, and also grapes and hgs. Of great importance to the develop-ment of Jewish industry are the laboury of the Rechwoth Research Institute carried on under the direction of Dr. Chaim Weizmann and Dr. David Bergmann. Much development has been achieved by the Jews in Palestine. The modern vils. in the desert, the drained marshes and in the desert, the drained marshes and reclaimed dunes, the schools, hospitals, factories, and social services are all evidence of their practical activities. The Jews in Palestine have remained untouched by the native mode of life; they have not learnt from the Arabs how to build houses that are cool, spacious, and cheap—this conservation being the result of the invigerants having come from sult of the imi digrants having come from the Diaspora, from the ghettoes and suburbs and displaced persons' (q.r.) camps of the world and having brought with them scrups of allen civilisation packed up in transit. Life in I.'s cap, has an amorphous quality that gives the impression of being the large Jewish suburb of a non-existent city.

of a non-existent city.

The Socialist parties in L., with their materialist and anti-clerical doctrine, occupy all political and economic key positions. Yet life in 1.18 (1919) nevertheless under the sway of clericalism as in no other country of the wolld—a paradox in view of the fact that the orthodox religious element represents only about 13 per cent of the pop. 1. has a univ. on Mount Scopus in Jerusalem, but no medical faculty there manny because dissecting bodies is against Mosaic law. The dominant political party is the Labour party (Mapai), which commands about one-third of the total voice and can rule only in coalliton—either with the United Workers' party on the extreme Left or with the Revisionists and other Hight wing groups, and it is said that if it wishes to rule independently of the extreme leight and Loft it must make concessions to the clurgy. The paradox here in present day I. is that of a Socialist country under clerical sway, which may be explained by the gap in its hist and the fact that its herees are still the Prophets and its only classic the Bible. But while this state of things may last for some yoars the young native generation.

which is already playing a dominant part in the Israeli army, has no memory of ghettoes, is developing a native folklore and national tradition of its own, and may well carry out a bloodless secular div. between Church and State.

A common language of the immigrants of recent decades was a practical necessity, and the choice of Heb. followed naturally. The movement to revive Heb. began in

a continuation of W. thought, art, and values, or on a veneer of Levantinism.

The Knesset, the name for the Israeli constituent and legislative assembly, met for the first time on March 8, 1949, in its permanent home in Tel Aviv. Immigration and development figured largely in the gov.'s programme, it being proposed to launch at once a four-year development and absorption plan to double the pop. in

Odhams Press Ltd.

ISRAEL: YOUNG JEWS MARCH TO WORK ON A NEW SETTLEMENT

The Hebrew inscription on the makeshift ceremonial arch reads (translated): 'Be this village a nest of securiles (safety) to us, to our sons (children), and to all the refugees of (the people of) Israel'

Palestine in the 1880's; by the end of the [First World War it became, with Arable and Eng., the official language of the country. Biblical Heb. is the language of the gov. and parliament, of schools and the gov. and parliament, of schools and courts, of press and radio. But it is not a dead language, and was not so even before Zionism (though that movement gave it a new vitality) having been a lingua franca for Jewish scholars all over the world. Its future in I. is assured. (See also Hebrews: The rebirth of the Hebrew tonque through Zionism.) At Hebrev tongue through Zionism.) At State. In the year ending about April 25, present the whole educational system is 1949, more than 210,000 Jews entered the based on developing out of its anct. roots country and over 100,000 of these arrived a specifically Heb. culture rather than on in the four months of 1949. Although

that period by mass immigration. But concern for I.'s economic condition came upon the heels of this optimistic proposal. Through unlimited immigration that condition was rapidly becoming more dan-gerous than were the advancing Arab armies in the previous year and this con-cern at length crystallised into the sombre realisation that I. could not depend indefinitely on the generosity of world jewry or foreign loans, and that only by her own efforts would I. survive as a sovereign more than 150,000 had been housed 53,000 were then (April 26) still in reception camps and suffering from great overcrowding, while thousands of immigrants who had houses were without work. In who had houses were without work. In these circumstances the gov, announced plans for an austerity plan based on the Brit. model, including a rationing system with a dictytic standard, control of imports and home production, fixing of maximum prices for essential articles and heavy surcharges on unessential goods and restriction of luxuries to export needs.

restriction of inxuries to export needs.

It was realised that a vital factor in the development of I. was the Negeb, the desert wilderness in S. Palostine reaching to the Sinai and the Suez Canal. The basis of the 1949 four-year plan was the restriction of the control of the part of the second of the irrigation of this area to provide home-steads for the flood of immigrants. Political considerations compileate the situation, apart from the possibility of oil-discoveries. Its proximity to the Suez Canal must make the area a matter of concern for Britain, and in some quarters communal settlements are confused with communism, and regarded as a danger in view of the condition of the Arab States, Large-scale development, moreover, re-quires the water of the Jordan, and this in its turn depends upon a firm understanding between I, and Transjordan.

standing between I, and Transfordan.
It is clear that I, will continue to regard itself as a member of the W, nations. The attitude of Britain, and the activities of the Arab Lagion, in a large mensure destroyed the pro-British feeling which was once latent, but the U.S.A. ha, undertaken the rôle of protector. Dollars from America formed (m 1949) a vital part of I.'s economy, this causing a move to the right in internal polities.

The behaviour of the I. Gov. fowards

The behaviour of the I. Gov. towards its Arab minority of about 120,000 has been charactised by moderation and a desire to weld them into the community. Freedom of the press and religion was estab, and Arab workers grouped into trade unions attlibute to the central Trade Union ('ouncil (Histadruth), Education and the vote were secured for women: Arabic as well as Hebrew is compulsory in State schools.

The estimated Jewish pop. of Palestine at the end of 1946 was 608,000. Jews formed the whole pop. of Tel Aviv (183,200) also of Petah-Tiqva (18,000) and Rehovot (10,200), and there were 71,000 Jews in Hata and 31,000 in Jaffa. See Musa Alami, The Lesson of Palestine

(Beirut) 1919.

Italian Art, in the dawn of Christian art in the fourth century a common style was sought in architecture, sculpture and painting, so as to give a common expres-sion to the new religious ideas. The hist. of the development of Gothic architecture in Italy establishes very clearly the gradual transition from here ideas to Romanesque and Byzantine and ultimately to Gothic. Earlier Gothic architecture in Italy never achieved the striking effects it achieved in other European countries owing to the constant influence of classical traditions and, in lesser degree, to the in-fluence of Gk., Arab, and Moorish work. The earliest buildings used for Christian worship in Italy were not more adapted for such worship than for pagan rites. The form of architecture used was the Rom, art of the times, and to a large extent Rom. buildings, and particularly basilieas, were converted from the time of Constantine into Christian churches and anct. monuments were despoiled to provide the material for the Christian provide the material for the Christian basilicas, mansoleums, and baptisteries, and even for the Arch of Constantine. The church of San Vitale, Ravenna, affords clear evidence of the way in which the constructional arrangements of pagan Rome were copied and utilised by the Christians. At the end of the sixth contury and during the seventh, decoration in Rome assumes the Byzantine style even in colouring a in the beststyle even in colouring, e.g. in the basi-lica of the Apostles or in the mosaic of S. Vitale, Ravenna. In the Carolingian period of the ninth century the conflict between indigenous and foreign influences is interrupted by an attempt to return to the classical antique; but it is impossible to estimate the cultural movement of the tine art continued to spread westward and litteenth century and finds a master in llyzantine livery earling and sacred leons the L. tradition and indicates the art of and goldsmiths' work supplied models for all Europe from the tenth to the twelfth centuries,—a wealth of splendour which extant in St. Mark's at the contribution of the contributi

In what is called the second golden age, from the ninth to the eleventh centuries, Italy was enriched with Byzantine struc-

tures. Some of the best still contribute to the beauty of Venice and Sicily. The Gk. orlent had its influence on painting up to the close of the thirteenth century, though not on architecture or sculpture for since the eleventh century a new art had appeared, known as Romancsque, though some think it should more appropriately be called It. for one of its strongest characteristics was a harking back to old classical Rom. memories in the decora-

THE FIVE DOMES OF ST. MARK'S, VENICE

tion of cathedrals. Modern art, Adolfo Venturi, had its beginnings in the Romanesque cathedral with its subordination of most elements to light effects, its doorways adorned with rare magnificence. Romanesque art in sculpture may be exemplified in the statuary of Antelami at Parma and Milan. In Tuscan, a whole line of architects in marble seems to have inherited a classical conception of design inherited a classical conception of design and to have maintained its integrity throughout the century, e.g. in the Bap-tistery at Florence and the cathedral of Ficsole. In the early thirteenth century (tothic designs were beginning to appear in Italy. This is shown in the construc-tion in 1216 of the classic norch of Serm Italy. This is shewn in the construc-tion in 1216 of the classic perch of San Lorenzo and in 1210 that of Civita Castel-Yet at the same time the Cosmati lana. still adhered to the horizontal in preference to the vertical and to the rounded arch, and it is from the Cosmati that the Umbrian architects trace their artistic

the sculpture of Italy was decidedly in-ferior to that of more N. countries and much of it was actually the work of N.

sculptors. Pisani and later artists, the early figures are purely secondary to the architecture they are intended to decorate and they they are intended to decorate and they are the work of men who were primarily architects. But after the end of the thirteenth century the reverse was more often the case—as is exemplified by the sculptured decorations at the W. end of Orylete cathedral. During the thirteenth century Rome and the central provs. of the produced were few sculptures. century Rome and the central provs. of Italy produced very few sculptors of ability, almost the only notable men being the Cosmati already mentioned. But during the fourteenth century Florence and neighbouring cities were the chief centres of it, sculpture and in the succeeding century Florence had become the asthetic cap, of the world, having attained a pitch of artistic wealth and perfection rivalled only by that of anct. Athens, and indeed there is some similarity between Florentine plastic art of this period and

that of fourth or fifth century Athens. Niccolo d'Apulia's statuary is reminiscent of the mighty constructions of anct. Etruria and Rome and marks a break-away from Homanesque art. It heralds the reform in sculpture continued by Giovanni Pisano, in whose hands the repre-sentation of the human figure attains a completeness which It. painting could not acquire till a century later. In Niccolo's baptistery at Pisa sculpture is sub-ordinated to architectural framework, but in the pulpit at Siena, made by him in collaboration with Giovanni Pisano, the sculptural effect is richer and more varied. In the fountain at Perugia, the finest flower of Giovanni's brilliant imagination, the influence of Niccolo has all but vanthe influence of Siccoto has an our vanished and 'grave tranquility has yielded to excited rhythm' and these qualities are to be found in the fellowers of Glovanni Pisano—Glotto, Andrea Pisano, Orcagna, who was famed as a goldsmith and painter as well as a sculptor, and Nino Pisano sculptors of the thirteenth and fourteenth centuries. Another of the most inspired creations of Glovanni Pisano is the 'Massacre of the Innocents' in one of the relicis of the Baptistery of Pisa. Well has it been said that this impassioned contemporary of Dante never created a greater or more dramatic work of art than these convulsed groups of mothers and children.' Andrea Pisano, originally an obscure goldsmith, became famous for his bronze bas-rellefs in the Florentine Baptistery. In it he shows a mastery of the representation of movement and a regard for the unity and inter-relationship of the varied seems of a story which introduce a fundamental re-form in composition in which he was forestalled only by Giotto in his paintings. The later half of the trecento also exhibits a nascent tendency towards reality, a tendency exemplified amongst the Veronese sculptors and particularly in the Venetian-, Jacobello and Pier Paolo delle

Unlike the sculpture of the Florentine art. Cavallini was the herald of the stil nuovo in It. painting and it was he who inspired Giotto. He was a master of the 'Roman School' and the greatest exponent of the classical style at the end of the thirteenth century. Some of his finest work is to be seen in the messages of santa Maria in Trastevere, Rome, notably in the panel of the 'Birth of the Virgin' and in his fre-coes in the convent of Santa Cecilia, Rome. Glotto, who with Duccio di Buomisegna was a pioneer in liberating the arts from the rigid medieval tradition, reveals the profound tranquillity, the dignity of the spirit of this first renaissance of poetry and painting. His figures, far from imitating the silhouettes of contemporary sculpture, recall the massive simplicity of primitive monuments and their simplicity is enhanced by a corres-ponding simplicity of scenic background. His greatest paintings were destroyed, but in the Scrovegm chapel his trescoes reveal his power of capturing life, his sense of human character, and his keen dramatic instruct. Climbue the Florentine con-tinues the Romanesque tradition as may bo seen in his work in the Unizi gallery. Florence, and the frescoes at Assisi. Other names of the fourteenth century are those of Simone Martini, an artist with a rare sense of beauty of line, of colour, of graceful movement, and of human expression, Lippo Memmi and Ambroglio and Pletro Lorenzetti of the 'Sienese School,' a 'sort of a sthetic Lotus-land of painters,'

Quattrocento or influenth century It, architecture is glorified by the gonius of Brun lleschi, the inventor of architectural perspective. The exteriors of his buildings preserve medieval eastle features but the internal decoration is inspired by classical art. The church of Santa Croco in Florence and the cathedral there exhibit his work at its best. His follower Leon Battista Alberti, nevertheless gives the exterior a significance of style of its own. In Brunelleschi's art there is a light Florentine elegance in the airy arcades and friezes of cherubin; in that of Alberti is shewn a premiercom.

love of the romantie. Of the quattrocento
was Francesco di Giorgio Martim who
was Francesco di Gubbio. The Lombard shewn a predilection for the massive, a love of the romantic. Of the quattrocento Gothic style of architecture of the fif-teenth century is illustrated by the Ca' d'Oro Palaco at Venice and the Doge's Palace. The Arco Foscari in the latter is the work of the sculptor Antonio Rizzo. Amadeo, in Milan, renounced the Gothic style, yet carried its flowery decoration into the Renaissance, as is shown in the into the Renaissance, as is shown in the facade of the Colleoni chapel at Bergamo. The lofty spirit pervading the work of the Urbino artist, Donato Bramante, is exemplified in the church of San Satiro, Milan and in the Trividzio chapel, San Nazaro, in the same city.

The Cothic style characterises the work of many it artists at the beginning of the

of many it. artists at the beginning of the Wenetians, Jacobello and Pier Paolo delle fifteenth century. A mong them may be masegne.

Great names in painting in the trecentor are those of Pietro Cavallino, Giotto, and Cimabue, the last-named, as Dante not a great artist, but he inherited much records, being the first famous name in of the Siena School's feeling for beauty of person, of line, and of colour, enhanced by a lively fancy which filled his compositions with jewels and flowers, rich brocades and gentle laughing faces so representative of the court art of his time. Antonio Pisano (Pisanello) is, however, the greatest painter of this artistic movement, but he displays a child-like pleasure in the minute presen-tation of natural objects. Other painters of this century were Fra Angelico, Musaccio, Paolo I ccello, Andrea del Castagno, Piero della Francesca, Melozzo da Forli, Luca Signorelli, Antonio Pollajuolo, Andrea Verrocchio, Filippo Lippi, Domenico Ghirlandaio, Giovanni di Paolo, Pinturicchio, Perngino, Bottwelli Mantegna, Cosimo Tura a pioneer of the Ferrarese School- C. Crivelli, Francesco del Cossa also of the Ferrarese School Borgognone. Bramantino, Ercole de' Roberti, Antonello da Messina, Cima da Conegliano, Giovanni Bellini, Gentile Bellini, and Carpaccio. These are the masters of those great artists who were to invest the succeeding century with the full splendour of it, art thus Leonardo da Vinci derives descent from Verrocchio who perfected the art of shading figures and endowing them with spiritual refinement: Raphael derives from Perugno and 1 20 della Francesca; from Perugnio and 1 an della Francesca; best work he 'uses line with a sense of Michelangelo from Bactoolo and Signor-elli, both, especially the latter, remarkable a living thing? (Holmes). Leonardo da for energy and vigour in their treatment (via) also had this quality but is inclined of the human name and their reaction it confine it with selentine considerations, from impressiveness: Correggio (Allegri) whereas Botticelli uses rhythms for the from Manteana, the founder of human-latte pointing in N. Italy, and Costa; brated allegories 'Primavera' and 'The Giorgione and Titian from Giovanni Burth of Venus' exhibit these qualities Bellim, whose laces are invested with the in their highest degree. Manteana seeks clear light of innate goodness and calm, the glanuour of anet. Rome in statues and clear light of innate goodness and calm. Fra Angelico's supreme quality is that of colour, and no other painter of the time employed tones of such pullty. He has been described as 'the chief prophet in Italy of the beauty of holine-s. designs are always exquisite and some-times, as in the Florentine frescoes. The Transfiguration, and The Marys at the Sepulchre,' they attain extraordinary Masaceto, who died premagrandeur. turely, assimilated scientific principles with the same natural ease with which he and the same natural east with which he mustered the general construction and appearance of the human figure. In his fiesco 'The Tribute Money' there is a mt. range which, in Ruskin's judgment, was the first piece of real mt. drawing in anct, art. L'eccilo was a great craftsman but he combined science with art to such an extent that it seemed to Vasari the art was overbalanced. Grandour characterlees the few surviving works of Andrea dal Castagno as may be seen in the small Grueffixlon in the Brit. National Gallery. Of the Florentines of the affreenth century Fra Filippo Lippi is noted for his gift of colour in the grand manner. traiture assumes a more prominent place with Chirlandaio, a pupil of Baldovinetti. Perugino, like Pinturicchio, has an eye tor undulating airy distances which seem to unduating any distribution of the property of

oid and new generations. His sense of specious design was unrivalled by his contemporaries and make him a greater pioneer of landscape than Perugino. As pioneer of landscape than Perigino. As a portrait painter he has no contemporary superior. In 'Baptism' and 'Nativity' the National Gallery has two of his best panel paintings. Signorelli was one of the most original masters of his time, whose energy found its outlet in the robust whose energy found its outlet in the robust treatment of the nude, which he handled with a solid power only surpassed by Machelmagelo binself. Antonio Pollai-uolo made a close study of artistic ana-tonu, as may be seen in the 'Martyrdom of S. sebastrur' in London. His 'Apollo and Paphne,' also in the National Gallery, nuoves him an admirable artist. Verroeproves him an admirable artist. chio's name sarvives chiefly as a sculptor, though he was also a musician and goldsmith as well as painter, but we are never certain how far paintings ascribed to him are wholly his work and not sometimes the work of his great pupil Leonardo da Vinci. Botticelli, the great actist of lineal design is world famous for the languorous poetic beauty of his feminine types, but beneath this beauty lies a vigorous artistic energy. In all his best work he 'uses line with a sense of the glamour of anet. Rome in statues and rehels and most of his paintings have been described as a kind of coloured sculpture in the flat.' Typical examples are 'Trumph of Sciplo' and 'Samson and Deldah 'm the National Gallery, Material splendoms are apparent in the work of Carlo Crivelli, many of whose paintings are in the National Gallery, Giovanni Bellim shows a wonderful and teader sympathy between man and nature, allied, however, to great artistic powers. Within however, to great artistic powers. Within the range of his devotional studies he shows so remarkable a variety of design, notion and shows so remarkable a valuely of using the there is a los example dominated Venice for a judgment, drawing in translueent colour effects are the peculiar t craftsman glery of the Venetian school. In Carglery of the Venetian school. In Car-paccio of the same school the Venetian delight in pageantry tound its most complete expression.

Pra's dominance in sculpture ended

with the fourteenth century and as we have seen passed to Florence. The moment of transition from Gothic to The Renaissance art can be studied in the work of Lorenzo Chiberti, who vanquished Bunelleschi in the competition in 1402 for the decoration of the second door of the Florentine Baptistery. Jacopo della Quercia of Siena, a near contemporary of Chiberti, is a holder innovator in his love for strong relief and vigour of subject. The last traces of the Gothic tradition of Bernard.' Ploro della Francesca, a Flor-sculpture are abolished by Donatello who entine by choice, is the link between the for half a century imposes his own art on Italy as a national art. His equestian statue of the (attauncinta at Padua is one of the noblect in the world and only rivalled by the statue of Colleoni at Venne by Verrocchio and Leopardi. In has relief he creates almost impressionistic effects of Bacchie movement. He has no rival in representing the ebb and flow of a crowd. Other sculptors of this century include Luca della Robbia, a maker of statuettes in luseany. Desiders da Settignano with a faulty for carving graceful articocatic figures. Francesco di Gorgio. Viatim. who was architect painter and sculpter and three Horen time artists, Bertaldo. Antonno del Polabido and Andrea Verrocchio (already mentioned as punters) who almost outdo Donatello in attacking the problem of vital movement the passion of the Hor

entine honaissance In the sixteenth century Rome became the artistic cap of Italy Painters, sculp tors and architects flocked there, and on their departure spield the new gospel throughout Italy and a national artistic style developed in the name of Rome Architects as students of Rom classicism endowed their buildings with an imposing monumental aspect ind a thythm of regular proportions the leader of this school of artistic thought was 100 nto Bramante the architect of the Belveder. at Rome and of the sturcase of the Vati can but the unity of the monumental and the harmonius is the work of Michiangulo and of Cultinno and Antonio Singallo Great (xamilia) of Michiangelo work in architecture are to be seen in the Sagresti Nuova of San I orenzo at Florence and in the magnificent dome of St Peters and Rome Other architects of this period are Jacopo Tatti (Sansovino), Andrea I alladio of Venice and Vignola, the architect of the Palazzo I arnese In sixteenth century sculpture Michelangelo dominates the field He raised the sculpture of the modern worl i to its zenith of glory set at the same time he sowed the seeds of a rapidly approach ing decline for his initiators—such as Baccio Bandinclli Giacomo della Porta Ammanati and others copied and exaggerated his faults without the saving grace of a scintilla of his genius. The aggrated in a fault without the saving grace of a scintilla of his genius. The Lapiths and Centuars and two figures of Slaves in the Louvre may be mentioned as examples of Michelingthe's power of dynamic expression the u.h. the nude dynamic expression on the man human figure Subtlety and refinement inform his spiendid lieta group of figures in St. Peter's As a sculptor Benvenuto (cllini strives after size, but with him as with Sansovino and Alos sandro Vittoria the art of Michelangelo is

whose bronge statue of 'Mercury' in the lills is a triumph of movement while mother of his works is the great fountain at Bologna

In N Italy in the fourteenth to six teenth centuries term cotta was adapted to the moet claborate architectural purposes. It has the W façade of the cathedral at Monza, the cathedral of teena, and S Maria delle Grazie in Milan are striking examples of the splendid effects obtainable by terms cotta work. But the most important application of terms cotta in me livial Italy was to statuary—relifes, busts and groups of life sized figures of the litteenth and state in the enturier some of the Itoentine terms cotta sculpture of long in the system of Itoentine terms in the succentral country were produced by Caridos a (unbropio loppa) for S Sutno at Ulian and by Gaudo Mazzoni for churches in Modena

LEONARDO S 'GIOCONDA'

with him as with Sansovino and Ales sandro Vittoria the art of Vichelangelo is reduced to a sobriety that yet is not devoid of grace. The tomb of Giovanni Galeazzo Visconta, completed e 1560, is a sumptuous example of the style of the Renaissance grown fiably from excess of richness and through abandonment of the simple purity of lifteenth century art. The sixteenth century indeed was one of transition to the state of degradation, yet it produced many sculptors of high ability, such as Giovanni da Bologna.

The sixteenth century in It painting was rendered glorious by a constellation of supreme artists whose names are headed by those of Leonardo da Vinci, Michelangelo, and Raphael, and include Titian Giorgione, Allegri (Correggio), Veronce (Caliari), Sebastiano del Plombio, Jacopo Tintoretto, Gambattista Moroni and Caravaggio It is true discussioned that his influence was so extraordinary that it is ability, such as Giovanni da Bologna.

without mentioning his name.' His interpretation of chiaroscuro and his solution of the problems of form and movement proclaim the scientific vi-lonary looking into the heart of nature. Yet the Yet the dominion of sixteenth century art properly belongs to Michelangelo, the artist of the prologue of the hist, of man in the Sistine Chapel, rather than to Leonardo. The masterly power of his art can be comprehended only by long study, the study of all that the progressive Florentine artists had been striving to achieve since the time of Masacelo but was attained only by Michelangelo. Like the great (ik. artists before him he seized on the nucle as the best medium for revealing the highest asthetic perfection: but, while Titian and Correggio sought this perfection in the sensions, Michelangelo sought it triumphantly in physical force. Power and in-tellect are the qualities that mark his art, a profound knowledge of nature and careful study of the living model, yet no servile copying even of nature, for he often violates rules of proportion and, in other ways, rejects the lessons of science if that is necessary for the expression of his idea. For he was, perhaps, the greatest of idealists; his figures live by virtue of the life he infused has them and remain the grandest creations of Italian art' (Bryan). Raphael embodies the highest aspirations and finest culture of the Re-naissance. He made a study of the fre-coes of Masaccio and the reliefs of Doma-tello and of Michelangelo's sculpture and the work of Mantegna, and, next to Michelangelo, he was the most representa-Vatican are remarkable for a solemn grandeur of composition, wonderful portraiture, and great depth and richness of colour. Harmoulous rhythm is, for Raphael, beauty itself as it is for Alberti. His tranquil art reflects the cultivated urbane society in which he moved and he urbane society in which he moved and he ture and sculpture of the seventeenth had his triumphs, triumphs so real that century are dominated by the innovator even Michelangelo felt uncasiness at his Loranzo Bernini. The Fountain of the growing fame and, it is said, availed him Four Rivers in Rome and the nonument self of the powers of Sebastiano 'del Plombio' as a colourist for his own de-signs for a Picta group at Viterbo in order to outrival him. Titian, who was a pupil of Glorgione, reaches the heights of sensuous beauty and as a colourist is unrivalled; but spiritual beauty is often wanting; he was a realist and, as Ruskin says, no ascotic. He tried like the Gk. artists to express the joic de rirre of human kind, and no pointer was ever more brilliantly successful in the effort. His women's portraits have a rare charm and as a portrait painter he is admitted to be of the front rank. One of his most famous portraits is ' Homme au Gant '(in the Louvre) In this craft he undoubtedly influenced Velasquez. Classical myths and romanticidylls were the stuff of Glorgione's genius. rayus were the stuff of Glorgione's genius. Seventeenth century Bolognese painting finds its chief representatives in the Fanous among the last named are Caracci—who founded the School of the Sacred and Profane Love in the Borg Eelecties at Bolognes—Barbieri (called hese Gallery, 'The Three Ages of Man' in the Bridgewater Gallery, and 'Noli me Tangere' in London. He delights in pletorial visions without any concrete Landscape, with Glorgione, because of Mattia Preti, Salvator Possible and Caracciolo, Mattia Preti, Salvator Possible and Caracciolo, Mattia Preti, Salvator Possible and Profance of Caracciolo, Mattia Preti, Salvator Possible and Profance of Caracciolo, Mattia Preti, Salvator Possible and Profance of Caracciolo, Mattia Preti, Salvator Possible of Caraccio

comes the main subject of the picture and figures belong to the landscape, not the landscape to the figures (Bryan). In his later works he approaches nearer the classical (ik. than does any other master classical (ik. than does any other master of the Remaissance, while yet revealing a note of yearning that was alien to the Gk. conception. His celebrated Bacchanal Bacchans and Arladne,' in the National Gallery, is one of the supreme masterpiers of all time. Callari (Veronese), as may be seen from his famous 'Marriage at Cana', in the Learner delicity in the group. Cana' in the Louvre, delights in the gorgrous in style and conception. Pomp and geous in style and conception. Pomp and sple adour of earthly pageantry, the value glory of humankind, are manifestly the most obvious features of his typical banqueting scenes. Tintoretto's fame, apart from his power of portraiture, rests upon his vast imaginative compositions, with the character of which Ruskin has familianted us. His Christ before Pilate is both massive and dramatic. Caragogical both massive and dramatic. Caravaggio led the reaction from the Eclectics—a naturalistic reaction from conventionalism and academic idealism analogous to the revolt in France under Manet and Courbet. Typical of Curavaggio's style are 'Tho Death of the Virgin' in the Louvre and the 'Flight into Egypt' in the Doria Gallery, Rome. His new movement, Gallery, Rome. His new movement, says or Charles Holmes, was of such importance to the arts that its effects have portance to the arts that its effects have endured to our own day. Notable painters of the Ferrare-e school were Francesco Bianchi (Giovanni di Niccolo Luteri), Dosso and Battista Dossi, and Buvenuto Tisi (called Garofalo). Garofalo was strongly influenced by Raphael and by Dosso Dossi. His religious compositions, if monotonous and wearisma. positions, if monotonous and wearisome, are of high technical quality and his classical myths are somewhat too conventional, but his 'Mars and Venus' (Dresden Gallery) has charm.

l'ost-Renaissance baroque It, architecof t rban VIII. are examples of his sculpture. His daring innovations in the churches, his sumptuous palaces and monuments of marble, bronze, and gold, lent the Eternal City a new-found mag-nificence. An equally hold innovator of this century was Borrommi who first introduced contorted spandrels and hollow mouldings. In his lavish use of arabesques and colours he is as far removed from the classical tradition as is Bernini with his love of light effects on gold and coloured marbles. Valvassori's splendid coloured marbles. Valvassori's splendid. Doria Palace is an illustration of the new rococo stylo. Other architects and sculptors of the time are Pietro de Cortona, Maderno, and Rainaldi.

Giordano, and Cavallino Bernado Strozzi today 'All three belong to the Realist is amongst the best portant painters of school the time Gian Battista Liepolo in the cighteenth continy is noted for his transparent atmospheric checks. In concep tion he derives from his contemporary Prazetta his power of invention and decor riazetta his power of invention and decor ation as revealed in the tre-cors of Antony and Chopatra in the islazed fabra Venico Also of the eighteenth century is Canaletto (Anton) Cinale the painter of the Venetian canals and camps. Italian East Africa. The name given by Italy in 1936, after her conquest of Abysania, to the ters in it, occupation in E. Africa. They then comprised the former colonies of Entrea (a,v.) and it Somaliland (see Fight Land), and were divided into the prove, Eritrea, Amhara, Galla, Harar and Somalis, the cap, Addis Ababa, being a separate dust, not included Ababa, being a separate dist. not included in any prov The total area was 600,000 sq. m., and the pop, was estimated at 7,000,000 The whole of this colonial empire was lost in the second World War

in 1910-41.

Italian East Africa, Campaign in (1940-41). The conquest of it. E. Africa-Eritroa, it. Somaliland, and Abysinia, besides the recapture of Brit Somaliland was one of the most remarkable cam-paigns in the annals of African warfare The lessons of mechanised warfare had The besons of incommend warrance about taken to heart, great distances over difficult mountainous country were cover ed with spectroular case the coop ration of the R.A. F was effective to a degree, while the co-ordination of all the forces, operating from a dozen differ ent directions, pointed to a highly credit ent directions, pointed to a highly credit able staff organisation. Imperial force-comprising S. Africans, S. Rhodesians, Sudanese troops, the King's African Riffes, and The Royal Wafican frontlet Force together with Abyssinian patriot Force together with Advisible patient forces, all took pait and, in the denouement, following the conquest of Entres some three forces were all advaning at great speed on Addis Ababa whore the its, had hoped to hold out long enough for the rains to save them. Let for long, for the rains to save them. Not for long, not the least important function of the Brit, forces was themselves to play a similar rôle and to hold in check large it armies, while Gen Wavell's forces were advancing on Cyrenalca (see BATTLE OF THE WESTERN DESERY). This accomplished, all the forces were set in motion some advancing from the Sudan into Natherswip and in Abysinia and into Erites, other, north ovacuation became nevitable, others across Ogaden and to Harar, while others across Ogaden and to Harar, while others penctrated W. and S.W. Aftican and S. Rhodesian squadrons also Abyssinia. But at first, following the raided Mogadishu, cap. or it. Somaliland, Abyssinis and into Entres, other north ward from Kenya and into S. Abyssinia.

able to do more than hold frontier posts, yielding them only after stubborn resistance; while Brit. Somaliland had to be evacuated and it even secured to many somewnat doubtful whether the Brit. would ever be able to counter the main It. thrust against Alexandria and the Suez, the fall of which would have multiplied the difficulties of a campaign in Italia Africa beyond conjecture.

Aftica beyond conjecture.

The Its began operations by bombing Berbera, cap. of Brit. Somaliland, and by attaking Brit. Moyale just inside the Kenya border, and, crossing the Abyssinian-Sudanese frontier, occupied more Brit frontier posts. Early in July, S. Attican and S. Rhodesian airmen bombed It croditiones at Diredawa an important to on the railway from Addis Ababa to Dubbit in kr. Somahland, (which colony Dubuti in kr Somahland, (which colony was now under the orders of the Vichy Gov of unoccupied France and in no sense an ally of Britain), and Massawa, the chief port of Fritres. On Aug. 5 the Its, in-vaded Brit Somaliland from Abysinia moving on Odweins, Hargers, and Zeils. The colony was defended only by in bile motorised units of the Somaliland Camel Corps. Zeila was occupied without opcorps. Lena was orenthed without op-position. Hargelsa was taken by a force including tanks, artillers, and aircraft. The Brit delaying force fell back. Zeila, nuder the original plan was to have been defended by the Fr but, owing to their collapse, it was not advisable to send Brit. forces to take their place as they would have been isolated from the main garrison in Brit Somaliland, sman as the track on Aug 11 the Its. made a general attack on The Track of T positions covering Jugargan Pass. The Brit staff decided that it was impractio-able to defend Brit. Somalilard and more advantageous to make the enemy uso up advantageous to make the enemy uso up his supplies in what was, strategically, a wisternl enterprise—a policy which later proved institled. The its wert using two divs., complete with artillery and armoured fighting vehicles originally included to oppose the fit forces in Fr. condition. At this stage all the Brit. could do was to bomb It positions at Ingl, Macaca, and Desse in Entrea and Abysime, as well as harass the It. advance in Brit. Somalitand But the Brit. torces, although unremoreed, continued to tost with great determination of the way to Berbera. Ly nitually, however, the Brit, troops were evacuated from the colony all the guns, excepting two lost in the campaign, being tubarked and the stores dostroyed. The original disposi-tion had been has don the scheme of Angle-Fr. collaboration under which the flunk, the pivot of the whole position. The only sound course in the circumstances was to fight reargueri actions with the small force available and to unfirst the maximum losses on the enemy until

Anglo-Egyptian Sudan-which was in enemy occupation. Extensive raids were carried out a few days later by Brit, and S. African bombers on aerodromes at Neghelli, Jelib, Kismayu, and Mogadishu—notably on that of the last-named tn. All through the campaigns against the Its., whether in Cyrenaica or in E. Africa, the Brit. command adopted the sound course of bombing the enemy's planes on the ground or fighting them out of the skies so that, ultimately, when the Brit. turn came to advance, the Its. were hampered for lack of aircraft and of undamaged acrodromes and, indeed, the process of destruction of machines continued right through the campaign, Brit. losses in planes and pilots being relatively slight. There was now a luli in operations.

Numerically the enemy was in a formid-ably superior position. But he met stout Brit. resistance, and where by sheer weight of numbers and metal he forced a way through, it was only to encounter a dogged opponent, who contested literally every foot of ground. In the conditions in which the Brit. forces were placed by reason of the collapse of France a greater military nation than the It, would have captured Aden and Egypt. Their failure captured Aden and Egypt. Their failure to make any substantial progress anywhere in Africa while faced by forces negligible in numbers gave their opponents encouragement in a time of gloom.

Over two months later Mr. Anthony Eden, war minister, toured the Middle E., while Gen. Smuts toured E. Africa, to inspect the Brit. defences. This was the preliminary to the turning of the tide, which began with the capture of Gallabat, the Abyssinian-Sudanese border. which important position had been taken by the enemy in June. This capture was made by Brit. and Indian troops, with tanks and artillery, and with the co-opera-tion of the R.A.F., the enemy being taken by surprise. The R.A.F. also attacked by surprise. The K.A.F. and attacked the key positions of Agordat and Keren in Eritrea and bombed Assab, a port in Eritrea. The enemy now began to appre-ciate his danger, fighting grew flercer, and in the next four days Gallabat changed in the next four days Gainata Changes hands sev. times. Asmara, cap. of En-trea, Gura, and Massawa, Eritrea's chief port, were bombed, while Brit. artillery fire forced the enemy to evacuate Meteu-ma, 2 m. from Callabat (Nov. 24). At the same time Asosa and Conduc in Abyssinia were raided by the R.A.F. who gave the Ita. no respite anywhere. At this period (Nov. 1940-Jan. 1941) the focus of interest was the battle of the W. Desert. Wavell's spectacular advance to Benghazi being facilitated by the fact that Gen. Cunningham's operations in It. E. Africa prevented the duke of Aosta, commander-in-chief in It. E. Africa, from

rendering Graziani any help.
On Jan. 14 Hailé Selassié (q.r.), who was now in Khartoum, announced that he would soon cross the Abyssinian frontier and lead an Abyssinian army against the

and railway buildings in Kassala in the raised at Gojjam by Ras Mongasha and raised at Gojjam by Ras Mongasha and the war drums were rallying the Ahys-smian patriots. Hallé Sclassié said that, like Marshal Badoglio (q.r.), he would enter Addis Abaha on a white horse, tear down the figure of a wolf erected by the Its in the square, and reinstate the white marble statue of the Lion of Judah (the original of which had been taken to Rome). Ras Kassa, one of the leading Abyseinian generals in the Abyseinian-It. war, arrived in Khartoum on Jan. 21 to join

his emperor.

By now Brit. troops were successfully advancing into Eritrea, while Indian troops were marching over the Sudan frontier. A contingent of regular troops of a newly-formed Abyssmian army went into action on the 22nd in the Sudanese-Entrean war zone, the command being given by Hallô Sclassié to a young Aus-tralian artiflery lieutenant. Hallô Sclas-sié had actually crossed the frontier a week ember, horsting the flag of Ethiopia on his native soil in the presence of Brit. and Abyssmian troops and accompanied by the Crown Prince and the duke of Harar the Crown Prince and the dust of the and leas k.assa. Kern and Arcota, to-gether with 600 lt. prisoners and two guns, and to the Brit. forces on Jan. 29. From kenya patrols had crossed the frontier at numerous points without meeting with the enemy. In Eritrea the Brit. attack was now concentrated on the Agordat-Barentu area. The distances and physi-cal obstacles of this difficult region were overcome by strong concentrations of Imperial troops through the labours of the Capo Mechanical Transport companies. By the end of the month operations were developing on all African fronts—the Sudan-Abyssinian frontier, Konya-Abys-sinian frontier, Eritrea, and It. Somaliland --while revolt was spreading in Abyssinia. Agordat fell on Feb. 1—giving the Brit. a junction of considerable strategic importjunction of considerable strategic importance on the Red Sea railway. Brit, and Indian troops, with R.A.F. support, stormed the position, capturing a dozen tanks, and driving the enemy towards Barentu and Keren—a stronghold surrounded by natural rocky fastnesses of great height. Other It. forces, harassed by Abysanian patriots, withdrew from the Entrean-Abysanian frontier, abandoning their mechanical transport and soon ing their mechanical transport, and soon they were in full retreat towards Gondar closely followed by mobile forces. Throughout feb. the enemy in Abyssinia, Eritres, and it. Somahland was always in retreat save at Keren—a stronghold on which every device of military engineering skill had been lavished. Here the enemy had sought to make a stand after being driven out of Barentu (Feb. 3) leaving hundreds of killed and wounded with many guns and other equipment which were of great

use for arming the Abyssiman patriots.

The Imperial troops now laid siege to
Keren. It was to prove the most costly operation of the whole campaign, but by Feb. 7 over 3500 prisoners had been taken, and wherever the enemy gave ground war material littered his track. There were now in simultaneous operation Its. The revolt, fomented by the Brit. in ground war material littered his track. that country, was now making great head—There were now in simultaneous operation way. The imperial standard had been some five movements: the penetration of It. Somaliland by S. African troops; an advance in S. Abyssinia by S. Africans; an advance through the N. part of Abyssinia, a patriot advance from the W. into Abyssinia and in S.W. Abyssinia; and the attack by mixed troops on Keren. The important port of Kismayu (It. Somaliland) fell to the S. Africans on Fob. 15. The attack was carried out in secondarities with the Parcel New and co-operation with the Royal Navy and the S. African air force. Five days later the troops were across the Juba R., while other troops from that dominion took Mega in S. Abyssinia, an It. air base some 6500 ft. above sea-level and the head

announcement that occupied ters. of an important motor-road to Addis Ababa. Later in the month the Imperial forces made a remarkably rapid advance in It. Somalliand. They took Moga-dishu, the cap., on the 25th after a march more rapid even than that of the army of the Nile in Cyrcnaica. This gave them the centre of a good road system and so demoralised the enemy that over 9000 of them surrendered. On the Kenya-Abys-sinia border Abyssinian irregulars drove the Its. from their last footholds in the Brit. colony by taking both Brit. and It. Moyale, positions which had proved almost as stubborn as that of Keren. On the first day of March an important pass covering the approach to Koren was cap-tured by an Anglo-Fr. force advancing from the N., the Fr. troops being Senega-less who had trekked across the continent to Port Sudan to help the cause of Free Frenchmen. Burye, an important It. fort, fell to the patriots on March 4, and

Penetration into Abyssinia was now in progress on twelve fronts, including a thrust on Gondar in the N., a drive by putriot forces towards Debra Markos, the next goal after Burye; a Brit. advance on Harar from It. Sonaliland; a thrust from the Sudan to Afodu; and other penetrations in the Blue Nile region of S.W. Abyssinia. But time was nonetheless an essential factor in the general plans of the Brit. authorities. The lenger Keren held out the greater the possibility of the rains saving the Its. On Alarch 18, bourses. But Trains. possibility of the rains saving the Its. On March 16, however, Brit., Indian, and Sudanese forces, strongly supported by the R.A.F., made a most determined attack on precipitous positions covering Kenen and stormed three important heights 3000 ft. high, under cover of well-directed gun fire and hombing. Reverting to the earlier days of March, the position was that the Brit All, Africa column. Gold Frenchmen. Burye, an important It. was that the Brit. All-Africa column (Gold fort, fell to the patriots on March 4, and Coast and S. African Forces) and Brit. the same day was noteworthy from the and Patriot Ethiopian forces were all

fourteen days of the month the All Africa column averaged over 40 m a day across rising uplands on Abyssini's K threshold Other forces around Lake Fana were then nearer Addis Ababa but the formidable barrier of the deeply canvoned Blue Nile retarded their progress The Imperial Army from Kritrea was fighting at the immensely strong It position of Kelen, the biggest battle of the campaign A trail of abandoned ammunition and material along the modern tarmac road marked the headlong flight of it soldiers. The All Africa column was cleaving two disorganised Africa column averaged over 40 m a day flight of it soldiers. The All Aftica enemy dies which were desperately trying of the description of the description of the description of Julian 20 m L of Harar, law ahead of the All Africa olumn The question was whether the olumn The question was whether the Its would make a stand there or in the nils round Harr But air reconnaissance found lyight afficient whence it was inferred that Harr with its high mud wall pierced by five gates would prove the key to the whole compaign. Yet it was doubtful whether the Its could spare as many as 10 000 troops for its defence—the number believed to be. for its defence—the number believed to be oncentrated in the vicinity Already to Keren and at all costs they must hold that position and the Blue vile crossings They had also to keep garrisons every where to ward off pair of while finally they had already lost over 30 000 prison ars, a serious depletior of the 500 000 men Italy was supposed to have under aims in

Meanwhile, on Mu h 18 Berbern was retaken as the result of a combined sea land, and also operation by imperial forces on the whole of But Somailland was recaptured, the It or upation having thus recaptured, the it of upation having this lasted some seven months Indications were, however, that the its never effectively occupied the object, failing to organise even a sembline of administration. Berbeia was actually taken with little fighting, a tribute to the skill and laring of the option which was effected by two landing parties, one mainly of Indian troop the other of Arnband Somah volunteers. The significance and Somali volunteers The significance of the rapid advance to Daga Bur (600 m of the raphic advance to Dagga Bur 1990 in N of Vogadishu), towards Jijigi and Harar, was that in this n ighbourhood existed one of the chief pissers into the Abysem in Highlands The Its hoped to reine to this int fortress and I old the limited number of practicable inlets in the expectation that the coming mains would restrict list operations to comparatively small columns The series of operations in E Al ca was in its way as billiant as the campaign of the W Descit If the

converging on Addis Ababa. For the first | formed the objective was far greater. The manner of the development of the campaign was in itself remarkable Apart the property of the property o position where for weeks on end they offered a vigorous resistance and contrived to hold up the Brit advance on Asmara and Massawa The Brit then initiated a specific furning movement from the N., which made rapid progress at first, but for long could not dislodge the enemy at Kercu

By March 27, however, the road to As man t was open to the victorious troops of man was open to the victorious troops of the Impenal Army of the Suden. The innul attack was delivered after fourteen days of ficre fighting an attack which batter down the last remnant of enemy reast ince and carried the But troops trump hantly into the the Guns cars, and great piles of infes and equipment encumbered the roadside. The It garrison numbering 10,000 including savoy Grena diers (ar binier), and Alpini, with nearly 200 c instrought from prepared positions of great strength on peaks 4000 ft above the Internal files on the Brit troops tolling up the teep slopes in a temp of well over 100. But nothing could deter the ad-100 But nothing could deter the ad vin crot even icekless counter attacks by tilts who realised that the fall of kein meant the loss of 1 11 rea the ono really loyal it colony the one outlet to Abysini In kitting gorge white I m from the trible ted 200 ydes out of the roll to thwart the Brit advance, the Brit soldiers fought hand to hand with machine gun crews which had been covering this obstacle. Harar fell at the covering this obstack. Harar fell at the the list and with this double success, the list obtained po session of three quarrof listed and practically scaled the list of the list force left in what ich und of Muscolinis F. African empire. The list phase of the campaign now opened with the general crumbling of the force left to the duke of Aosta viceoy of Abs. init, Brit planes actually taking off the women and children to place and safety. An init, first planes actually taking off it women and children to place sof safety. At the beginning of April more than half try-sania was in Brit hands. From A mara feen Platts troops were clam beging down mts 3000 ft, high to capture Mi wa while mother column was reachin, ut the road to Adowa the occupation of which was calculated to have a strong moral effect on both the Its and the kthicpian patriots. In the contral part of the front Gen Cunningham's troops were marching from Hagar and Diredawa restrict limit operations to comparatively small columns. The series of operations in E. Africa was in its way as brilliant as the campaign of the W. Descrit. If the campaign of the W. Descrit. If the army of the duke of Aosta was less formidable than that of Marshal Graziani the natural difficulties of the terrain were greater. If the pacq was slower, except for the rapid advance northwird from the by African troops and surrendered. The sole port now lett securely in the hands of and Harar, the size of the ters, which

was threatened, and the navy were closely watching it. The only consider able tas, held by the enemy in the interior were Dessle, Gondar, and Addis Ababa. Gondar was all but cut off by Abyssinian patriots, who were pressing on round Lake Tana and the sources of the Blue Nile. Dessle was filling with retreating soldiers from Eritrea, who, while streaming through the Green Valley were subjected to a major bombing attack by the S. African squadrons who raked the roads in the valley from end to end. Revolt was now sweeping the country behind the It. lines. Ironically, along the Addis Ababa railway, Brit, imperial troops were hurrying to protect the Its. against their own native conscripts. Abyssinian destreaming the roads are reconjung scrub everywhere except at Dessie and Addis Ababa, where it, white

setters were sulping the its, from the surrounding scrub everywhere except at Dessie and Addis Ababa, where it, white troops still outnumbered them.

The historic battlefield of Adova now fell into Brit, hands and then the hely city of Axum, and on April 9 Massowa capitulated. In the whole country there were now left only more or less discrepanised budies of troops, groung their organised budies of troops, groping their organised bodies of troops, groping their way towards Dessie Gondar, and Jimma Flerce fighting in the Foundation Pass, 14 m. S. of Dessie, was the prelude to the Brit. capture of this mt. stronghold in the last days of April. But there was still a strong force of the enemy under the still a strong force of the chemy under the duke of Aosta, at Amba Alagi, another mt. stronghold. Here the Its. held out for nearly three weeks. By May 14 the enemy had been driven back by the S. Africans to the peak of Mt. Alagi, where they had tunnelled galleries into the cliff faces and cut gun emplacements out of the rock. Machine-guns and artillery fired from the narrow mouths of expense whomsthey were insuming from a new contract. caverns where they were limitude from anything except by direct hit. But there was one weakness in this well-nigh impregnable stronghold. The long-prepared defences were intended to meet an attack from the N., and the S. Africans were plerging the vulnerable S. side. The stege of Amba Alagi reached its grunmest stage on May 14 when a terrible artiller, bom-bardment almost wiped out the 1t. forces. Deserters at night stole their own lorries to Deserters at night stole their own lorries to escape. The Transvaniers blusted the Its. out of their dug-outs. Fow escaped to carry back the tale of terror to the duke of Aceta's cavern—the very cavern in which Hailé Selassié had sheltered tive years previously from his It. conquerors. Some ten days later the duke of Aceta formally surrendered, together with some 19,000 prisoners. Thereafter there remained only small neckets of housloss rusistance. In amall pockets of hopeloss resistance. In only four months a well-equipped force of 125,000 Ita. and 200,000 native troops, of which 170,000 were infantry, with a considerable air force and 212 acrodromes, under an able commander, had been smashed and scattered. Of this great host the Brit. forces under Gen. Cunningham had captured about 190,000; 125,000 had deserted leaving nothing remaining in military formation, apart from one or two small bodies, numbering altogether 6000, who were soon to be rounded up. The were,

urgently required elsewhere is shewn by the fact that the Brit. forces at the beginning, when Italy took up arms. numbered fewer than 25,000 men, of whom only 5000 were white. At no time did the Brit. forces on all the fronts in E. Africa, even after the arrival of reinforcements from India and W. Africa, approach the strength of the combined It. metropolitan and native armies. And again, whereas the it garrison had begun with hundreds of heavy guns, the Brit. forces had no more than 63 field guns. Yet in four months the imperial forces under Gen. Cunningham had conquered three countuningham had conquered three countries and reconquered a fourth, totalling some 700,000 sq. m., captured 120,000 prisoners, 800 heavy guns, and 150 tanks, as well as thousands of motor vehicles, thousands of machine guns, and millions of rounds of ammunition. Most preconceived ideas of colonial warfare were abandoned. In this remarkable campaign sheer speed broke the its. The Brit. concentrated superior flavourer in a four warfare centrated superior fire-power in a few unexpected places. Gen. Cunningham's victory was the story of battles which began among the swamps of the Juba R. that cuts of Kenya from It. Somalikand. He formed a passage over the stream at two points, cut through the It. lines, and his two columns converged on one another full they met behind the enemy and formed a triangle at the apex. In one increasing wave the Brit. forces swept up the coast through Kismayu, Brava, and Moga-disin, then wheeled left across the desert with lines of communications lengthening to 1500 m. Great tracts of omeonquered ter. lay on either side, but still the Brit. forces pushed shead, lorries, guns, hospital and staff cars roaring up the road to the all-important position of lunes. It was without the same of the sa Junea. It was untechnical and unpre-cedented, but the Faccist orces, be-wildered at the loss of moral, which spread rapidly through their ranks at length surrendered their chief stronghold, keren, and that was really the beginning of the end. It is not a little strange that, at the beginning, between Jane and Sept. 1340, the Its. did not follow up their only success in capturing Kassala and Gallabat by a mechanised push on Atbara, the vital transport centre of the Sudan, and kartourn. Such a move might well have brought the whole country under their toke in a few days. In Kenya, too, they were advancing from Moyale to Buna, were advancing from Moyale to Buna, and in the Sudan, in Oct., they launched a drive into the S. of the country which, if better supported, outht to have reached the great Sennar Pain. The secret of the Brit. avoidance of disaster at this critical juncture, was that while machine-guns were being mounted on the walls of khartouur, and tanks traps laid before them, the Brit. generals, by a policy of aggressive patrols and then rapid movement of their small forces, caused the enemy to believe that they were opposed by numbers tanfold as great as they really by numbers tenfold as great as they really

It. resistance did not end entirely with I their right flank on the Curso and throughthe surrender of the duke of Aosta. disorganised garrisons of scattered strongholds, particularly at Jimma, Debri Tabor, and Gondur in N. Alyssinia, pro-tected by the seasonal tropic rains, held out for some weeks the last remnants of Muscolini's great army of Abyssinia. During this period, Ethiopian patriot troops took an effective part in operations which resulted in the capture by those forces alone of some 10,000 prisoners. The tt. commander of the garrison at Debri Tabor, 60 m. E. of Lake Tana, surrendored early in July (1941), not long after the fall of Jimma, and with his surrender, the sole important remaining garrison was that at Gondar, a strong natural position almost comparable with Keren. In the Battle of the Lakes', the operations which virtually ended with the capture of Jinma on June 20, and resulted in the climina tion of It. resistance from a vast area S.W. of Addis Ababa, the Brit. forces took over 30,000 prisoners and more than 100 guns. See also ITALO-ABYSSINIAN WAR, over 30,000 parsonana and an agencial see also ITALO-ABYSHINIAN WAR, 1935-36. Abysmnian Campaigns: Official Story of the Conquest of Italian East Africa (H.M.S.O.) 1913; Christine Sandford, Ethiopia under Haile Selassie, 1916. Italian Front, First World War Campaign on. Italy declared war on Austria-Hungary on May 23, 1915, and a general mobilisation was ordered for the next day

mobilisation was ordered for the next day but war was not declared against Germany until Aug 23, 1915. On May 25 It. forces penetrated Austrian ter. in S. Tyrol and the N E. corner of Venetia and along the Isonzo (q v.). Gradisca was occupied within a few days and the crossing of the Isonzo promptly followed. On the W. flank progress was being made in the Trentino. Au-trian posts on the Alpawero taken by the Its. in rapid succession At the end of May the frontier was crossed at Lake Garda at Riva (N. end of the lake) During the first week of June there was a stiffening of the whole line, and lighting became more serious. On July 20, the Its gained a victory in an all-day light on the Lower Isonzo. This developed into a series of conflicts on the Car-o (q.v.). In Oct. the W. flank was improved by securing Mt. Nodic which gave the Its. command of the Ledro valley. During the winter of 1915-16 the Austrians were preparing a counter-offensive in the Trentino paring a counter-onemister in the Trentino under the command of Archatake Charles, with Field-Marshal von Hoetzendorff as his Chief of Staff. The attack was launched on May 14 and by May 19 the Its. were in retreat on the whole Trentino from and the Austrians reached It soil. In ten days they had captured 24,000 prisoners and 250 guns. Assay (q,n) fell to the Austrians on May 29, and although their flanks were held, their centre continued to advance. The Its. counterattacked, and by June 26 had recovered a good deal of ground. Gen. Cadorna (q.v.) the It. commander-in-chief, hunched an offensive in the Isonzo on Aug. 6, 1916, and captured the bridgehead at Gorizla, with 10,000 prisoners. Further progress westward continued throughout the month. On Sept. 16, the Its. advanced

out Oct. and Nov. continued to press the Austrians back on their N.E. flank. In May 1917 a great offensive on the Isonau was launched, progress being made cheftly. Of Gorizia, and with the help of Brit. guns a serious threat was made to the Austrana on the Lulius front. trians on the Julian front. Brit. monitors also fired on the rear of the Austrians from the gulf of Trieste. In June the Its. made the gail of freste. In June the its, made some progress in the Trentino. On Aug. 19 they resumed the Isonzo offensive mainly across the Carso, and by the end of the month the high ground S.E. of Madoni was in their hands. About this time, Ger, troops, under the command of Gen. Otto von Bulow, were being transferred to the Isonzo front, and attacked the Its. on Oct. 24, 1917 the Its. were thrust back at Caporetto (q.r.), and the rout continued until the Gers, captured the on Ort. 29. This exposed the Its. on the Carso to the danger of envelopment, and a hasty withdrawal was made to the Tagliomento: but here the Gers. forced a passage and the situation became critical. At this time five dive. of Brit. troops under Gen. Plumer arrived on the It. front. In Nov. 1917 Cadorna was succeeded by Gen. Diaz. The Lts. defeated all attempts of the enemy to pierce the Playe front, so they turned their attention to the mt. sector further N. Here they to the mt. sector further N. Here they gamed some points, but the presence of Brit. and Fr. troops prevented any serious loss. In May 1918 Lord Cavan succeeded Gen. Plumer in command of the Brit. troops. On June 15, 1918, the Austrians launched their final assault. They at launched their final assault. They at-tacked on a ninety-in from with forty divs. from Asiago to the sea. The Plave was crossed at Montello, and Venice also was threatened, but the sector held by the lirt. stood firm against all attacks. Hefore the end of the mouth the Its. counter-attacked with the result that the Austrans were soon in full retreat. Oct. 26 a great offen-ive was launched against the Austrians which turned the retreat into a rout and ultimate surrender. retreat into a rout and utilinate surrouter. See L. Villari, War on the Italian Front, 1932; G. L. MoEntee, Italy's part in urining the World War, 1934.
Italian Front, Second World War Campaigns on. For the events leading up to this campaign, see Africa, North,

this campaign, see Africa, North, Sicord World War Campaigns in. Full of Pantelleria, Lampedum, and other small Italian islands.—Pantelleria, which, after 1937, was strongly fortified as a naval and air base, surrendered to allied forces on June 11, 1943, and was occupied by allied forces very shortly after the white flag was seen from the air flying from a bill top. Thus strender was the first instance where a strongly defended enemy bustion has been conquered from the air. The air attack began thirteen days previously and by June 11 had swelled to a terrifying climax. Bombers, fighter-bombers, and fighters were sent against this one target. Flying Fortrosses in greater numbers than ever previously used by the N.W. African Air Forces, made repeated sorties throughout the offensive, which lasted from dawn to dusk. Twice the allied commander gave the garrison (numbering 10,000) a chance to end the destruction, and twice the garrison rejected the offer. The air bombardment was supported by naval bombardment and towards the end of the attack strong forces of cruisers and destroyers were tiring salvos at frequent intervals. Early in the offensive the airfield was wrecked. Every ship in the harbour was put out of com-mission. By dusk of June 10 the is batteries, well-concealed and in heavy batteries, well-concealed and in heavy gun emplacements, were sllenced and the s.'s doom scaled. In addition to the garrison there were 6000 civilians on the is., but, happily, they suffered hardly any casualties, for the is, consists of volcanic rock which is full of galleries and air-raid shelters. Lampedusa and the still smaller is, of Linosa, both in the Pelagie group just over 100 m S.W. of Sicily, held out but a very short time after the surrender of Pantelleria. Lampedusa was subdued after a naval bombardment followed by a heavy air attack and Linesa surrendered

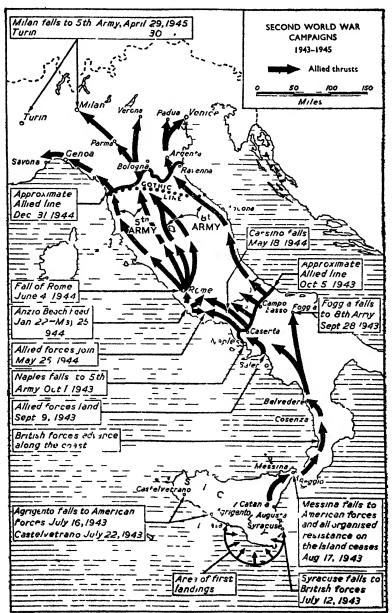

without a fight The Battle of Sicily (July-August, 1943)
—Angle-Amer forces under Gen. Alexander as deputy commander-in-chief, with Gen. Montgomery ammander-in-chief of the Brit. forces, in an armada of nearly 3000 vessels, invaded Sicily carly in July, 1943. The first stage of the invasion started on July 10, soon after the occupations of Lampadius, when tion of Pantelleria and Lampedusa, when the allied air forces crippled the Axis airbases in Sicily. This was so effective that the second stage, the estab, of bridgeheads in the is., was easily accomplished and the landings, preceded and accompanied by terrific air assaults and broadsides of warships commanded by Adm.-of-the-Fleet Sir Andrew Cunningham, on a 100-m. wide stretch of the coast from S. of Catania to Gela, met with only negligible resistance. The core of the invasion consisted of the seasoned troops of the Brit. Eighth Army, the Amer. Seventh Army and Canadian forces (First Canadian Infantry Div. and the First Canadian Army Tank Brigade). In the initial Army Tank Brigado). In the intui operations a large part was played by the troop-carrier command of the N.W. African Air Force and by paratroops, Amer. and Brit. Allied air forces acted throughout in close co-ordination with the sea and ground forces. 'Lightning 'aircraft left a trail of ravaged lorges, armoused cars and railway trains and its ning aircraft left a trail of ravaged lornes, armoured cars, and railway trains, and, in the vicinity of the ports, of small ships. Heavy day bombing attacks were made on Gerbini, Trupani, Milo, and Sciacca. Brit. raids by 'Wellingtons' were made at night on Syracuse and Catania. The Amers, took all the beaches assigned to them within three hours of their first landing. The strongest opposition was met in the Cape Passero area by Brit, and Canadian forces. The landings generally were less costly in casualties than had been expected and many hospital ships were held in reserve because they were not wanted. The next task was to secure the possession of the harbours and centres of

with the Canadians on his left flank, seized the road and railway S.W. to Pozallo in the extreme S. of the is., together with the port of Syracuse. other zone of operations -the bay of Gela - the Amers, under Gen. Patton, setzed Gelu, Licata, and other places along the Syracuse-Pozallo road. Seven enemy counter-attacks, the strongest in the direction of Gela, were made with tanks and infantry and all were repulsed, 2000 prisoners being taken. Ragusa, Florida, and Augusta fell on July 13 and two thrusts were now made from Syracuse and Augusta northwards towards Catania - the Amers., under Gen. Patton, seized Augusta, northwards towards Catania and S.-westwards to the Palazzolo heights which dominate the plain of Catania. Most resistance came from two Ger. paner divs., one facing the Brit. in the E. and the other the Amers. In the S. The allies soon penetrated in some sectors to a depth of 20 m. from the coast. By July 14 the Brit. Eighth Army was within 15 m. of Catania, but resistance was now obviously stiffening. In the W. the Amers, captured the important airfields of Course and Ponte Olivo. By this time over 12,000 prisoners had been taken, of whom 8000 were taken by the Amer. army. Though the Allied advance was speedy it was recognised by the commanders that, until the Catania plain and the Gerbini airlields were in their hands, resistance would be protracted, particularly in the mountainous regions of the N.E. and around Etna. Considerable gains, however, were made on July 15-16, the Eighth Army advancing sev. in beyond Augusta, and its spearheads striking into advance units of a posterior of the protection. advance units of a powerful Ger. force. Heavy losses were inflicted on the Axis forces in the W. sector, where the Amers. advanced sev. m. across difficult country. simultaneously with these operations, the heaviest combined air assault therefore launched from N. Africa was made on Naples (July 17) by more than 500 arcraft mostly from the N.W. Amer. Air arcraft mostly from the N.W Amer. Air Force, part of the Neapolitan royal arsenal being destroyed. Agrigento fed to the Amers, on July 16, a day of confused battle, with guns firing steadily from almond orchards and olive groves all round the city; but list tenples were unscathed. At the same time Porto Empedicle, named after the Schlan philosopher, also fell. The following day Caltanisetts, on the railway linking Agrigento and S.W. Sully with Catania and Messina, was taken by Gen. Patton's troops. 20 m. to the by Gen. Patton's troops. 20 m. to the E, the Canadians took Plazza Armerina and both Amers, and Canadians were now advancing on Enna, the most important paretton in the is. The Eighth Army, which had the hardest task in the campaign, was now some 3 in from Catana. On July 19 Rome was raided for the first time, when Amer, bombers attacked marshalling yards and railways—a raid which was to have immediate and profound effects on the political situation in Italy. On July 21 Enus fell and Amer. and Canadian forces were now threatening to turn the whole enemy line. With the to turn the whole enemy line. With the Amer. Seventh Army were Moroccan communication on the coast and close Amer. Seventh Army were Moroccan behind it. By July 12 Gen. Montgomery, Goums, who distinguished themselves as

mt infantry just as they did in the coastal mts of N lumsta With the Eighth Army sestab on July 19 of a bridgehead S. of Catania the Axis forces now began a general though olderly retreat towards
Messina in the areas of Catania about
6 m in with and 1 m in depth, the Gers
launched frequent counter attacks despite mounting casualties. Among their troops were lements of the rovived Hermann Goeling Panzer Grenadie Div but their numbers were dwindling. Casualties to numbers were dwindling Casualties to brit forces were far lower than had been anticipated. The Allied advance in the W half of the is continued with great rapidity. Castely trino with its import ant airfield, originally built for patrolling the Sicilian channel fell on July 22. Mai sair was then abandoned by the Aris troops. The threat to Palermo was accentrated Allied troops being now only 25 m. away, while other troops of the Sometimes Affect troops using now only 25 m away, while other troops of the Seventh Army were nearing the buy of Termini on the Neest Palermo fell to the Seventl Army on July 23, the enemy being completely surprised by a rapid thrust by advanced troops of highly with the true the Army of the Property mobile force. By this time the seventh Aimy had taken 27 000 prisoners, 250 guns and 10 000 000 rounds of ammuni tion besides destroying 84 tanks. The success of the Sicilian campaign coupled with the hombing of Rome, now had its political repercussions in Italy to Mussion line resigned and the king of Italy assumed supreme commar lofthe It armed for ea with Marshal Badogho is the new prime minister By the end of July the number of prioners was 7,000 three fourths of this total being taken by the Amers and it was now clear that the battle of Sicily had entered its culmin ting phase—the struggle for Catania in l Mesun; i he general offensive for these positions began to develop in Aug following a week of in tensive preparation during which large reinforcements of men an I guist had been reinforcements of men and runs had often moved up to the front The Brit 78th Div captured Centuripe after some very bitter street fighting. The 11st (High land) Div advanced in their right. To the left the Canadians captured Regulauto when the opposition was especially lies e Further the seventh Army cuttined Trains (Aug 2), Ceram and cuttin On the crast road the advance continued in the face of extensive enemy demolition. But the rate of Catania had been scaled at Centurity nearly 20 m away, for the commanding heights here gave the allies control of a the road from (atania round the W of i 'na in the same way that the Mayy had give a control of the 1 and round the k of I that and in such predicament the enemy had no alternative but to light in the city to the last or to campe under oover of darkness. He chose the lat er One strong reason for retirement was that

Axis defence The Amers, having landed parties at two points on the N coast so as to command coast roads to Randazzo, while the Brit took Actreale, the respective Allied armies were now fast converging on Randezzo Ger resistance had now however become more tenacious then ever The enemy tactics relied above all on demolitions and minefields protected with well sited machine guis, their hope being to evacuate the bulk of their armies under cover of rearguard actions to the It mainland. The rugged terrain was well adapted to these tactics. Randazzo however, eventually fell (Aug. 13) to the steady encerted Allied pressure The enemy had already been driven from most points N of Randazzo, and chare and Riposto on the E coast had been occupied. The Axis line in sicily now collapsed and their forces were m rull retreat Mossina fell on Aug 17
to the Amers who made contact there
with the Brit kighth Army later on the
same div All organised resistance in
Such hid now ceased. The Sucillan Such had now ceased. The Suillan compagn had thus ended after thirty eight does and the Allied forces stood in proximity of the mainland. Owing to the proximity of the mainland the Gers were able to run the guantile of his bombardment in the straits and to bring a few strains of the straits and to bring a second strain of the straits and to bring a second strain of the strains and the strains are the strains and the strains are the strains and the strains are strains. large; ut of then troops away Generally, high it of their troops away Generally, their release to the becomes for Skilv finally scaled the most by of the narrow seas to the Sawhei jershowly only Millacheld out in lenely lowlife, and the possibilities open dup were now almost unlimited. For tetal Axis caualtic were 180,000 Of the 10 000 to 70 000 Gers on the 18 at 1800 William 1000 William 1000 Gers on the 18 at 1800 William 1000 William 1000 Gers on the 18 at 1800 William 1000 Willia with 1 d between Aug 5 17 whin the Allie I are torces destroyed or damaged some 300 vessels trying to cross the straits Over 00 enciny guns and 260 tanks were detrived or captured while well over 1st meraft were brought down or cap-tured The Alles lost 103 tanks and 2st kun, and comparatively few aircraft The t ta. allied casualties were about 2,000—about 14,000 Prit and 11,000 Am 1

Further \ the \eventh Army captured Trums (Aug 2), Ceram and (aple) on the crass road the advance continued in the face of extensive enemy demolition. But the late of (atama had been scaled at Centurity nearly 20 m away, for the commanding heights here gave the allies control of a the road from (atama round the W of erms in the same way that the Navy had given control of the last or to expect under the city to the last or to expect under cover of darkness. He chose the last or to expect under cover of darkness, He chose the last or to expect under cover of darkness. Gov. had surrendered its forces uncondi- | Ger. defensive ring in the wild mts. separtionally and an armistice was granted. Hostilities between the Allies and the forces under Marshal Badoglio (q r.) therefore ceased and all Its. who co-operated in ejocting the Gers. from Italy were promised Allied support. The Fifth Army under the Amer. Gen. (Tark, including a Brit corps, landed near Naples at 4 A.M. on Sept. 9, the Brit, and Amer. warships covering their disembarcation. Soon covering their disembarcation. Soon three Allied forces were advancing inland from each corner of a great triangle to seize the whole of the foot of Italy. The Fifth Army was meeting intense Ger, opposition on the Salerno beaches in a struggle which was developing into a great battle for Naples. Part of Montgomery's Eighth Army was advancing northwards in Calabria. Other elements of the Eighth Army, having taken Brindisi and Turanto, were following retreating Ger forces to the N. of those tra. The most desperate lighting occurred for the Salerno bridgeheads, the in itself baying quickly fallen. The Gers, hoped to built heat the invadors into the sea evil to hurl back the invaders into the sea and, holding the high ground overlooking the Allied positions, were able to subject the Allies to a devastating fire from well-sited guns. But the bridgeheads from Salerno to Agropoli held firm, while over more reinforcements in men and material poured into the beaches and also into more southerly ports, covered by naval and air forces. The enemy had the advantage in the air, for whereas the Allied fighter planes of the N W. African Air Force had to fly from a great distance, the Ger dighters could operate from near bases. Allied air forces, however, flew over 800 sorties on Sept. 13 to support the infantry and gunners who were fighting on the open rescent of the plain of Salerno without cover of vegetation or terrain against an enemy skilled in the defensive use of hills dominating almost every point of the bridgeheads. The fighting there now grew more intense than ever, and, to harses the Ger. reinforcements, the N W African Air Force on "ept 11 made the most concentrated offensive until now of the whole Mediterranean war Mean while the Eighth Army, having selved Bari, Cosenza, and Belvedere, were making forced. If unopposed, marches to link up rescent of the plain of Salerno without forced, if unopposed, marches to link up with the Fifth, from which they were now separated by 70 m. Throwing a powerful separated by 70 m. Throwing a powerful mobile force across the Apulian plain, they then captured the important an base of then captured the important an name of Foggia (sept 28), considerable casualities being inflated on the Gers. In the advance. Extensive demolitions had been carried out by the enemy at Foggia and, the Apulian aqueduct having been destroyed, the tn. was without water. At the same time Castelnuovo was taken by the Fifth

ating Naples Plain from the gulf of Salerno. Among the crass and along the valleys were fought some of the bitterest engagements of the war. Ger reenguards had to be havoncted, bombed and blasted from their strongpoints Brit troops played a great part in fighting a way through. Shortly afterwards the naval base at Castellammare 14 m. across the bay from Naples fell, and the whole Serrento Penin-sula was in Allied hands. Naples fell on Oct 1 to Gen. Clark's army. Bombing and Ger. demolitions had left deep scars Bombing and Ger. demolitions had left deep sears on the city. Most of the public buildings, factories, whatves, wate houses, and installations of military value had been destroyed, mainly by fire. Shops were empty, roads closed, and streets inlead and demolished. As the Allies had long foreseen, the Gers had evacuated the city or criter to fake up a new toper deforting. norder to take up a very strong defensive position on the Volturno R, and on the line of that riv bitter fighting lasted for line of that riv bitter lighting lasted for some time. Meanwhile against growing resistance the Eighth Army pushed W. from Termoll on the Adrithe coast. The Fifth and Eighth Armies were now in contact with each other and the Allied line ran from Naples through Caserla, Campobasso, and S. Martino to Termoli. By capturing the time of Capua early in Oct. the Fifth Army at length won a bridgehead on the Volturno R. But though they advanced to the entire W. course of the riv in a single day, progress in the difficult riv in a single day, progress in the difficult country of the Apennines was slow. To-wards the end of the mouth there was a general advance on the whole of the Allied line except at its extrinities. It was evident that the line from Vasto on the Adriatic to Mondragone on the I's rrhenian sea by way of Isernia and Venifro, would be strenuously defended by the enemy, for it represented the strongest position that could be held S. of Rome and all roads now led to the cap.

Isernia, pivotal point in the Ger. de-tence and centre of their lateral communications, was captured by the Eighth Army on Nov 4. The Gers were also driven off Moote Massico in the 3, the aliced armies making a substantial advince along the whole line from the Tyrrheman coast to the knot of the Montagna de Matese in the centre of the Ger line Almost simultancously the Eighth Army struck across the Frigno R on the section of the front near the Adriatic coast, but there were near the Adriatic coast. But there were strong prepared for defines arross the riv 5 m behind and much bitter fighting lav annicilately ahead. Visio, on the coast, was taken on Nov 7 without a fight. Though unimportant as a harbour, it gave command of most of the road running SW, to Castiglione Meanwhile the Amer Fifth Army had advanced past Army, whose tank spearheads were thrusting acto the plain towards shatt red Naples, while other forces were pressing on through ditte alt mountainous country N. of Salerno The frenzy of Ger. demolitions in Naples and on the good to the city indicated that the Ger. commander, Kesselring, had no intention of defending it. It took the Fifth Army six days to pierce the Castiglione on Nov. 10 gave to the Eighth Army control of the whole road from Vasto to this important supply point in the Apennines The flying of the swastika over the vil. of Castelforte, on the Novice of the new swellor feasible of the new swellor feasible or several of the new swellor feasible or several of the new swellor feasible o side of the now swollen Garigliano seemed more than anything a gesture of defiance : but it symbolised the Ger, command's long obvious determination to stand and fight along the magnificent defensive positions on which it had now been thrown back. This defensive line is not a single line nor yet even a series of lines; rather is it a mass of easily-defended hills or mis. 36 m. in depth. The Fifth Army was now only on the approaches of these positions Savage counter attacks were launched to most virtually every Allied Improvement of position. It was evident to the Allied Command that, in view of the enemy's defensive strength, even local attacks and breaches might require long planning for what seemed to be disproportionate effort.

The Gers, were, in fact, well placed in Italy. They now had ten divs. on the central front facing the Fifth and Eighth Armics along the Carglinno-Sangro hue, stretching across to narrowest part of the Apennines, is the highest and wildest control the Apennines, is the highest and wildest and the Apennines, is the highest and wildest and the control of the Apennines, is the highest and wildest and the control of the Apennines, is the highest and wildest and the control of the contr country in the whole range. The Ger hope was that, even if Montgomery broke the Sangro line and threatened Rome from the N.E., they could at least hold him for a time in the mts. between the two fronts. Altogother the Gers, now had at this time (Nov. 19) nearly fifty divs. in Italy and the Balkans, an increase of from 10 to 15 divs. in the past mouth and obvious evidence of their realisation of the Allied threat to the whole S. and S.E. of

Europe. On Nov. 29 Gen. Montgomery, after a period of heavy rain and bogged conditions, began a new offensive across the Sangro, his attack being preceded by a demoralising air and artillery bombardment. Allied mastery of the air was so complete that in its initial attack the complete that in its initial action is lighth Army succeeded in gaining posi-tions along the outer edge of the Gora, winter defence line. Brit., Indian, and New Zealand troops made determined attacks, the enemy resisting with suc-cessive counter attacks supported with tanks including flame-throwing tanks, The sternest fighting was around the vils. of Mozzagrona and Santa Maria, which are 4 m from the sea, and also in the Archi area where a second bridgehead was estab On Dec. 1 the Eighth Army made a general advance along its whole right flank and shattered the most important part of the snartered me meet important part of the Gers. winter line in Italy. Lanciano, Castel di Frentano, and Casoli, on the lateral road from the Adelatot to the centre of Italy had now fallen to Montgomery, whose advance was added by the Tactical Air Force's devastating assault on Ger. positions and transport and their class support of the attacking troops close support of the attacking troops. The Gers. were now falling back in the Sangro sector, but the pursuit was ham-pered by the bad weather. Large

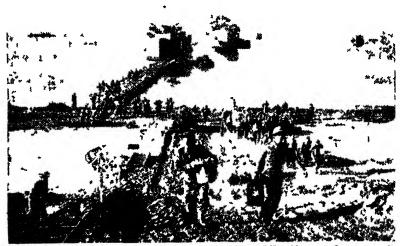

abandoned by the enemy, who had suffered severe casualties and was now rushing up reinforcements from N. Italy, in the ensuing days, in the W., Gen. Clark's Amer. and Brit. Forces, in a desperate struggle in rainy weather and across country which remains flooded and across country which remains flooded and across country which remains flooded and waterlogged long after the rains coase, slowly but surely drove the enemy from his strongly fortified positions on and around Monte Maggiore and Monte Camno. But the Gers, fought grinly to the first their still determine allow the pred defend their vital defences along the road to Rome. Hills, valleys, and ravines were defended with all the devices of mines and entanglements calculated to delay advancing troops, while deep in the mt. slopes gun emplacements were hewn out of the rock to a depth of 6 ft. or more Transport was so difficult and troops in such inaccessible places that supplies had to be dropped to them from the air. the E. the Eighth Army, despite a deluge of rain, crossed the Moro R., Canadian troops securing positions N. of it, includ-

Thomps securing positions it. or in, means ing Ortona.

Thereafter, for fivo weeks, there were no marked changes in the respective positions of the opposed forces. But on Jan 18, Brit, troops of the Fifth Army eventually crossed the Garigliano in the Tyre hemian coastal strip in face of fierce yet authorize Gor resistance. On the next on flective Ger. resistance. On the next day very hard fighting developed particu-On the next larly round Minturno, Castelforte, and Sulo vils. Hard also was the struggle on the high ground covering the Applian Way where it runs by the sea towards Formia and Gacta. The destruction of bridges and the sowing of innunerable landmines and the sowing of innumeratic landmines hampered progress. In the attack on a 7-in. Front from Minturno and Castal-forte cruisors and destroyers of the Royal Navy bombarded shore positions in the gulf of Gaota. Initially successful sea borne landings were made on Jan. 22 by Pitth Army troops S. of Rome near Notition and Angle only 32 m. from Rome. tuno and Anzlo only 32 m. from Rome, the troops advancing well inlard before meeting any resistance. The ters., far from expecting such a move, had sent strong reinforcements, including their best strong reinforcements, including their best motorised Panzer Grenadier divs. from the Rome area, S. to the Fifth Army front, where by then they were believed to have 100,000 men. The new Brit. landings were covered at sea by naval forces—Brit., Amer., Ok., Dutch, and Fr. under the command of Adm. Lowry of the U.S. Navy, Adm. Troubridge of the Royal Navy commanding the forces which landed the Brit. troops. The simultaneous Allied air offensive was directed against the ring of arrields round Rome against the ring of airfields round Rome and then on rail and road communications and then on rail and road communication-radiating northwards from the cap. These attacks by Flying Fortresses, Liber-ators, and R.A.F. Wellingtons ranged along every railway artery in the triangle formed by Fome, Pisa, and Florence. Other targets were Civita Vecchia, the nearest port N. of Rome, and a villa near Frascati (15 m. S. of Rome) which was known to be the carefully-concealed headquarters of Ober-kommando Sudwest, the quantities of guns and equipment were U.S. 12th Air Force scoring twenty-six

hits on the villa. Along the Garigliano valley advancing Brit forces repulsed heavy Ger counterattacks between Castel torte and Minturno (Ian 22) Even by the 25th no effective redstance to the landing- had been met and still more troops and supplies poured into Nettuno But to the 3 the Gers launched still more violent counter attacks against the lifth Army's main front in the Garigliano and eventually found to a halt, it had suc Rapido its area, most of those onelaughts acided in establishing a firm investment being hurled back with heavy loss to the of the Allied positions About Feb. 12

found time to concentrate a powerful army in the Alban hills overlooking the beachhead, bringing substantial conforcements from great distances. An Allied advance across the Applan Way met with stiff to-sistance and on heb 3 the Gers opened their first major attack on the beach head This was sustained with varying intensity for more than a week, and although it was

enemy particularly around Minturno Ihere were also violent struggles for the commanding position of Vinte Croce V of the important and hotiv contrated to of (whin) By Jan 29 the American Hotives had crossed the Rapido

After the Anzio Nettuno landing had been au cassfully made, it seemed that was power despite the loss of two cruisers and two landing craft, had into vened with decisive effect to turn the figure of the terposition on the Casino front and cut the lines of a mamunication to Rome When, therefore, in the first few days hardly any opposition was met, it seemed possible opposition was met, it seemed position of that the der. commander, Kesselring, that the attack too had spent its strength. must begin a general withdrawal. Gen. In the ensuing week of bad weather here to consolidate his position on shore pared to deliver his third attack. This but, before he could do so, the Gers. had

the initiative passed for a brief space to the Allies when Brit troops advanced near Curneto but four day later kesselling resumed the assault with a fur our attack on a narrow front along the Anzio Albano tond Deep penetrations were made in the Allies position, but after some days of exceptionally bitter fighting this second for attack also commonced to failter. The heavy gives of the Allied first intervened with powerful support and as the tide of a-squit began to turn. the lombers on the lifth arms concentrated their weight against the flamming Ger attack and by Feb 22 it was evident but it exceeded both in intensity. It was delivered early on the 29th, Kesseiring's tactics on this occasion being to concentrate a great weight of attack upon a very marrow front, while trying to contain the Allied forces holding other sections of the perimeter by subsidiary or local operations. The main blow was delivered with three divs. against a sector of no more than a thousand yards on the Carroccto side of Cistorna, the aim apparently being to strike at the hinge between the Britand Amer. forces. It fell, however, directly on the Third Amer. Infantry Div., which included some of the most sensoned troops the United States had in the Mediteranean area. The Amers, were forced to yield some ground before the innertus of so fremendous a weight of men and armour, but their counterattack was soon leunched and by the next day they had regained all the ground won by the ciers. Meanwhile the line as a whole had held at the other points attacked so that by March 1 the Gers, were everywhere tack at their starting-points, having infleted heavy casualties, but having themselves suffered much more severe loses.

inuch more severe tosses.

General Alexander's Attack on the Gustar' and 'Hat' I nes—Capture of Home.—On the night of May 11-12 (re. Alexander launched a new offensive on the grand scale. This oftensive was really the opening of the general as aut on Hitler's fortress of Europe, it being the Allies' intention to invade France within a month and Stalin's to attack along the entire E. front almost et the same time, so as to emborrass the Gor. High Command with unultaneous oftensives in the W., S., and E. Alexander's oftensive was delivered after an intricate regrouping of armics, the main weight of the Eighth having been brought across to the W. side while the reconstituted Royal It. Army while the reconstituted Royal R. Army (Corpo Italiano di Liberazione) took over the Adriatic sector. Having crossed the lis. Rapido and Garigliano, where these formed part of the Ger. (Justav Line, the Allied forces were soon assaulting the whole line with irresistible force. their victorious advance they were given tremendous air support. Heavy bombers, too, made a huge gap in the Avisio viaduct, thus stopping the movement of supplies through the Brenner Pass. Fr. forces-mainly Goums and other colonial troops accustomed to mountainous country - made a spectacular advance on Ausonia and the vicinity. Moving with meredible speed across many miles of difficult mt. terrain they captured Monte Majo, opened a dangerous breach in the Gustav Line. and disorganised the whole system of defences in this part of the enemy's line. The Fr. were helped by a corresponding Amer. advence to the 8. Meanwhile Brit. forces were advancing through the Int. forces were advancing through the mouth of the Liri valley and threatening the Via Casilina and the Cassine position, while Polish troops had secured dominating positions N.W. of the Abbey (Monte Cassine). San Glorgio, was carried by storm, Meanwhile the Amers, were pushing ever further along the Applan Way and the W. coast. At the same time,

with the capture of Pignataro by Indian troops of the Eighth Army, a substantial bridgehead was estab. on the N. bank of the Liri and the Ger. grip on Cassino, the Via Casiina and the Abbey was relaxing. Cassino th. eventually fell on May 18 to Brit. troops and the Abbey was captured by the Poles. (For an account of the pre-tracted struggle for Cassino, Feb.—May, 1911, see Cassino, Battle or). With the fall of these famous positions the Gustav-Line S. of the Apennines had ceased to exist, and the victorious allies were everywhere advancing on the outposts of the 'Adolf Hitler' Line—the name of these rearward positions being some indication of their importance in the eyes of the Ger. Command. Farther S. the Fr. captured Esperia and the Amers., who had seized Forma, were now overrunning the Gaeta peninsuls. So far some two fifths of the Ger. Tenth Army, which was holding the main front, had been almost destroyed. The Aquino-Ponteorro position was now the lynch-pin of keeseding's defences, for it was the centre of vital road communications, which, if lost, would mean that the Allies might turn the whole N. part of the Hitler Line. Hence Ger, resistance now stiffened considerably and there were counterataks against both the Brit, and the Fr. (ict. local reserves were thrown in in an effort to save the situation, which, however, still further deteriorated with the local more high ground N.W. of Pico.

A new and dramutic turn was now given to the campaign by the sudden launching of a strong offensive by the Anglo-Americaes of the more or less dormant Anglo-Kachiead. This was in fact the second phase of Gen. Alexander's general offensive. The struggle now grew most intense: Fr., Polish, and Brit, troops were wrestling successfully with the dense and latticate Ger. defences of the Liri Valley centred on Pontecorvo and facing repeated and desperate counter attacks, while the Amers., meeting with slighter resistance, were overrunning the trackless mass of the Volscian mist to the S. Asur Borgo Grappa, on the coastal highway between Terracina and Anzio, the heachhead forces at length linked up with the main lifth Army front, so that a single Allied from the work was now in the hands of the Appian Way was now in the hands of the Appian Way was now in the hands of the Allies. Allied tanks, supported by infantry, soon wiped out the last Ger. resistance in the centre of the heavily damaged in. of Cisterna, and Brit, troops broke through the defences about the railway station on May 25. All that day a house-to-house battle was fought among the crumbled ruins of the in. On the same day that Cisterna fell Pontecorvo was taken by Canadian armoured cars. That memorable day saw the whole original Ger. defence line shattered. Allied tanks were now massing with other strong concentrations in the coastal plain for a powerful thrust from the Appian Way to Highway Six (Via Casilina), Keeseiring's supply route. All through this day tanks and infantry

carious that the withdrawal of their divafrom the Liri Valley was made due northwards instead of in the direction of Rome. Resecting's forces were virtually split in two, one body retiring into the Apennines, the other into the Alban Hills, which latter constituted the last naturally defemsible positions protecting the cap. from the S. Over 10,000 prisoners had now fallen to Gen. Alexander. Yet the Gers. continued to make a stout, if ill-organised, continued. Kesselring, in the endeavour to retain Rome, staked everything on the defence of the strongholds of Velletri and Valmontone, the two bastions of the Alban Hills. The last battle for Rome now be-Fierce lighting raged in the Alban foothills, with desperate counter attacks by the Hermann Goering Div., which now re-appeared and temporarily checked the Amers. S. of Campo Leone the Brit. forces made a substantial advance. N.W. of Cassino New Zealanders were pressing onward to the important stronghold of Avezzano, through which ran Kesselring's vital escape route. Velletri was surrounded by June 2 after the Amers, had taken Monte Artemislo. Velletri and Valmontone fell to the Fifth Army that day and the fall of Rome was imminent. ontstanding and significant success in the Alban Hills was achieved after only a week of bitter struggle in which Ger. resistance grew more intense each day, the vine-yards of Velletri being packed with Ger. snipers. Velletri suffered tragically in the encounter, and viewed from the Applan Way, which skirts the tn. on the W. side, it seemed as if not a single house had escaped damage.

The Fifth Army entered Rome ou June 4, after some heavy fighting in the outskirts. The Gers. did little damage to outskirts. The Gers. did little damage to the city, partly because their retreat was too precipitate and partly because Kesselring accepted proposals by the Vatican to declare Rome an open city. The main objective of Gen. Alexander was, however, not the occupation of Rome; it was the destruction of the Ger. armics. Leading elements of the Fifth Army passed through Rome on June 5 and crossed the Tiber. The wreckage of Ger. rehicles littered the road for 80 m. N of vehicles littered the road for 80 m. N of Rome. Hundreds of heavy bombers Rome. Hundreds of heavy bombers joined the fighter-bombers in continuous attacks on the retreating enemy. Eighth Army mantry and tanks advanced along the whole line of attack. The total of the whole line of attack. The total of prisoners had now risen to 20,000. Civita Veochia, the naval base 40 m. N.W. of Rome, fell off June 7, Viterbo and Tarquinia on the 9th Further and further the Gers. were being forced back E. of the Tibes. The advance on the right was

poured through the gap in the Hitler Line near Pontecorvo, forcing the encury to evacuate the tn. and to swing back their districtions on the Aquino defences so that it now ran insecurely E. and W. on the S. side of Highway Six. The Ger. Italy, swiftly in the W., slowly and hold on the Via Casilina was now so presented that the withdrawal of their diversions the control of the coast Indian troops entered Pescara, the sluice gates of which above are, the sluice gates of which had been destroyed by Allied hombers some weeks previously. Kesselring's line was now that it now ran insecurity in the coast Indian troops entered Pescara, the sluice gates of which had been destroyed by Allied hombers some weeks previously. Kesselring's line was now that it now ran insecurity E. and W. on the State of the Coast Indian troops entered Pescara, the sluice gates of which had been destroyed by Allied hombers some weeks previously. Kesselring's line was now that it now ran insecurity E. and W. on the State of the Coast Indian troops entered Pescara, the sluice gates of which had been destroyed by Allied hombers some weeks previously. Kesselring's line was now that it now ran insecurity E. and W. on the State of the Coast Indian troops entered Pescara, the sluice gates of which had been destroyed by Allied hombers some weeks previously. Admatic.

After troops of the Seventh Indian Div. had crossed the Pescara and the tn. of Percara had fallon resistance on the Adri-atic coastal sector grow less stiff; there artic coastal sector grow less stall; there was, however, greater resistance in the Wespecially at Grosseto and in the centro around Terni. By now ter, strength in Italy had been halved by Gen. Alexander's offensive. But Kesselring still had the equivalent of twelve and a half divs. left to fight, three of them fresh including the Fourth Parachute Div. About 70,000 men or the remains of eight and a half divs. were now (June 23) deployed on a line across Italy which ran through Chlosi, S. of Lako Trasimeno, N. of Perugia and to the Adriatic about 30 m. S. of Ancona. Heavy rains had given the Gers, a respite and enabled them to recover equilibrium. Eighth Army forces on each side of Perugla were engaged in very heavy fighting and it was apparent that the Gers. had no intention of withdrawing from their strong positions between Lakes Trasimono and Chiu-i without an attack in force.

A Fr force landed on Elba on June 18 and, with the support of allied aircraft and ships, soon occupied a large part of the is., which was important to the Gers. as a submarine base. The chief obstacles to the lauding, was in the Golfo di Campo ou the S. coast from powerful batteries on the Capo d'Enfola. They were strongly sited on granite heights but were put out of action by bombing attacks. By noon on the next day resistance ceased with the capture of Portofernio, the remainder of the garrison, numbering nearly 2000 Gers.

being captured. The Allied Advance to the 'Gothic Line.' -The advance of the Allies to the so-called 'Gothle Line' involved sharp fighting in difficult mt. country, but by early July the Eighth Army had broken through the Ger. defences to the W. of Lake Tradineno and in the direction of Arezzo, 20 m. N. of the lake. The Gothle line ran from Pisa on the Tyrrhenian coast to Rimini on the Adulatic; it had been powerfully fortified for a year past because it was the pen-ultimate line of natural defence before the ultimate line of natural defence before the valley of the Po and, if the Albes broke it, Kesselring's only remaining substantial line was the curve of the Apennines E.S.E. of Genoa. The Fr. corps now took Siena, an anct. city which was an important point on the W. approach, by the Via Cassin, to the Gothic line. A fortnight later Polish troops took Ancona and the Amers, entered Leghorn where the port installations were found to have been destroyed. The capture of Ancona was a swift exploit helped by Polish tanks, and over 2000 prisoners were taken. and over 2000 prisoners were taken.
The enemy, however, maintained a very stubborn defence along the high ground facing the Eighth Army in front of Florslower but the terrain was much more The enemy, however, maintained a very mountainous; but by the capture of stubborn defence along the high ground Aveszano the Eighth Army gained confacing the Eighth Army in front of Flortrol of the central Appenine sector while ence, the outskirts of which great city the

Eighth reached soon after the capture of shoddy, perhaps the deliberate sabotage Arezzo. By the end of the first week of it. contractors. The fiercest struggle Aug. Brit. troops held that part of Floring the battle for the Gothic Line was for ence which lies S. of the Arno, but great care was taken in their use of heavy weapons to avoid damaging historic buildings, and this retarded progress. The Gors., however, soon abandoned their loudly-proclaimed pretence of keeping loudy-proceeding processes of keeping Florence as open the and already all the bridges across the riv. except the Ponte-vecchie were wrecked by the Fourth Parachute Div. At the end of Aug., however, the Gers. had been forced back into the the Gers, had been forced back into the Gothic line and Polish troops were in Pesaro on the Adriatic and engaged in bitter fighting against the Ger. First Parachute Div. kighth Army infantry and tanks had now crossed the R. Poglia and were strongly attacking the Gothic line. The campaign entered a new and significant phase in the opening days of Sept. with the Gothic line broken along a 20 m. front in the Adriance sector, a general advance of the Eighth Army's front, the capture of Pise, and an advance by the Fifth Army across the Arno. The breaching of the Gothic line by the troops of the Eighth Army was an outstandingly de-cisive victory rull darms, in which Brit., Canadian, Polish, It., and Indian troops had all taken part since the attack stretch of that line from Pesaro inland was the most trusted Ger. defonce work outside Germany uself and was intended to form one of the main buttresses of

Hitler's fortress of Europe.

The capture of Rimani—The Gothic Line overcome.—Rimin, E. pivot of Kesselring's position, tell to the Eighth Army on Sept. 22 after one of the stiffest battles sept. 22 areer one of the sciences batters that Army had had to fight in the course of its long advance from Egypt. The battle of the Gothe Line and of the Apennines ended when First Gk. Mt. Brigade and Canadian tanks captured the deserted and anct. city of Ravenna, while the Brit. and Empire forces further inland were driving over the last foothills of the were griving over the last roomlis of the Apennines to reach the Marcchith R., which runs from Arezo to Rimini, and thereby to render the city untenable. In front of the Alles now lay the Lombardy Plain, with the Po valley stretching out beyond. The Eighth Army were now within striking distance of the Via Emilia, historic road along the Po valley to Robustia. toric road along the Po valley to Bologna toric road along the Po valley to Bologna and Placenza. In these operations two Gor, divs. had lost most of their effective strength, while losses far heuvier than those they had suffered at Cassino had been inflicted on the First and Fourth Parachute and four other divs., including the crack Twenty-Sixth Panzer Div.

Ten days relentless attack against the Gothic Line defences in the central sector had left those defences a shattered mass of Tubble and battered fortifications. The Gothic Line could have been the most formidable artificial defensive system the formidable artificial detensive system the first that so far encountered. But its defects were that it was overlooked from the S. and lacked depth. Moreover, the destruction of the Ger. Army of the allied offensive on the It. Front to compass the destruction of the Ger. Army of the destruction of the Ger. Army of the allied offensive on the It. Front to compass the destruction of the Ger. Army of the allied offensive on the It. Front to compass the destruction of the Ger. Army of the compass the destruction of the Ger. Army of the compass the same to have each of the compass the same that the compass the same to have each of the compass the same that the compass that the compass the same that the compass that the compass the same that the compass that the com

the high ground which commanded the timini gap; while the fighting for Gem-mano. Croce, Sansovino, and Coriano proved to be some of the bloodiest in the proved to be some of the bloodiest in the hist. of the Brit. Army. Ger. reinforcements to the extent of five divs. were rushed up in the hope of saving the Gothic Line. Gemmano changed hands ten times. Then Gen. Leese, commanding the Eighth Army, pushed the Canadian corps into the gap between the sea and hills without waiting for the lills to be cleared. The experiment succeeded. While the Canadians drown on to canture While the Canadians drove on to capture San Fortunato ridge overlooking Rimini San Fortunato riage overnousing rimma and the Marecchia valley, the sorely-tried Brit. Home line regiments, in a magnificent riposte, carried Croce and Monte Colonto. The Ger. abandoned most of their prepared positions and retired to the N. slopes of the Apennines, where they are all carried by the humanous reads. were well served by the numerous roads of the Po valley, leaving the Allies to maintain forward communication through the rough trails over the ints. The Ger. the rough trails over the ints. The Ger. left flank was covered by a great depth of defensible riv. lines.

Ravenna and Faenza captured by Allies -- Surio, Senio, and Santerno Rivers crossed. After this series of successes there followed a long lull, broken a month later when the kighth Army advanced between the Via Emilia and the coast, driving the Gers, back to the Suvio R. Six weeks later Ravenna was entered by the Canadian unit, Princess Louise's Dragoon Guards, in a brilliant encircling movement which forced the Gers. to withdraw to avoid being trapped. Then twelve days later, on Dec. 17, after highly constructive to avoid the construction of the construc effective operations in which ten. Frey-berr New Zealanders played the chief part, the Eighth Army captured Faenza and carried the allied line nearer Bologna. But the lull was resumed and four months elapsed before the Allies struck again in Italy, though in the meantime they rendered valuable service in holding down rendered valuable service in holding down twenty-five well-equipped for days, at a time when the Allies were carrying out their great attacks on the W. and E. Fronts. From the Allied viewpoint the main difficulty in Italy lay in the nature of the country. The Fifth and Eighth Armies had advanced northwards over nits, across rivs., and through defines a terrain pseuliarly adjusted for defence m terrain peculiarly adapted for defence, and they had never at any time had a sufficient superiority in numbers and equipment to enable them to schieve a equipment to enable them to achieve a decisive success. For, as the demands of other fronts grow, the lt. theatre of war had to take a subordinate place and for about four months, owing to wintry conditions, it had been quiescent. The co-ordinated attack on Germany from the S. may be said to have begun on April 10, 1945, with the appring of the

Italian parisans in control of northern maintenance of it parts and forces which, in turin and Milan, did not wait to be liberated but struck timely and powerful blow realist the Nazi and I asoist forces, greatly contributed to the enemy a dofeat and disorganisation. The liberation of Milan by the combined efforts of the Committee of National Liberation and partisans represented the oulininating effort of the resistence move-

ment, which during the previous year had | of Carinthia and Styria. ment, which during the previous year had been organised to a high degree of efficiency; and what happened in Milan and Turin happened also in Genoa and in nearly all the big cities of Lombardy and Piedmont. The result was that the greater part of the industrial equipment of N. Italy—factories, toundries, power stations, and hydro-electric plants—were preserved intert in so for as it was unpreserved intact in so far as it was un-damaged by alifed hombing. In the case of Milan abortive negotiations had been in progress for two months between the Committee of Liberation and the Ger. and committee of interation and the Ger. and Fascist authorities, with the object of ensuring that the Gers. should not wreck factories when they withdrew. Hence, when the Fifth Army crossed the Po, the Committee decided that the time had Committee decided that the time had come to put into action plans prepared for a general insurrection, with the object of seizing control before any harm could be done. The Gers, had no fighting troops in Milan at this time, and the Fascist militia of 100,000 men were unreliable and soon yielded to the partisans. Sporadic fighting continued for a short time but soon the committee of liberation was in control and had taken over the adminiscontrol and had taken over the administration of the city.

These events were the prelude to the total collapse of Ger. and Fascist resist-

total collapse of Ger. and Foscist resistance in Italy and their unconditional surrender to Field Marshal Alexander.

Unconditional surrender of tierman and Fascist Armics.—Long negotiations preceded the unconditional surrender of the Ger. and Fascist forces in Italy. They actually began as early as Feb. and most of what took place was without the knowledge of either Hitler or Himmler. The allied offensive, which began on April 9, was not affected by these negotiations, but doubtless in its turn it expedited the decision finally taken by the pedited the decision finally taken by the Gers. to surrender. On March 19 there was a conference near Locarno in Switzerland between two representatives of Sir Harold Alexander's staff and Gen. Karl Wolff, seulor 3.3. officer of the Ger. forces in N. Italy, at which the Allied officers told the Ger. general that Field-Marshal Alexander was interested only in getting authorised (ler. representatives to Caserta authorised ter. representatives to Caserta to accept unconditional surrender. Even-tually, on April 27, Wolff and two Ger. plenipotentiaries arrived in Switzerland and were brought by allied aircraft to Caserta next day. On the morning of April 29 the Gers, were told that either they must surrender unconditionally or the negotiations, which had been begun the previous day, would end without further delay. The Gers. then accepted the Allied terms for the surrender of their entire forces under Col. Gen. von Vietinghoff-Scheel's command to Field-Marshall Alexander, Allied Supreme Com-mander, Meditarranean. The instrument of surrender was signed in Caserta Palsoe, near Naples on April 29, the terms to be effective from noon, May 2. The ter. of the Ger. 'South-West Command' included all N. Italy to the Isonzo R. in the N.E. and the Austrian provs. of Vorari-N.E. and the Austrian provs. of Vorariberg, Tirol, and Salzburg, and portions ent feature. They were introduced into

The enemy's on carintina and Styria. The enemy is total forces surrended numbered over 900,000, the combatant troops of which fielded the remnants of twenty-two fier, and six It. Fascist divs. The terms involved the unconditional surrender by the Ger. commander of all forces under his command or control on land, sea, or in the air and the immediate immobilisation and air and the immediate immonusation was disarmament of enemy forces. It was also provided that the instrument would be superseded by any general instrument of surrender imposed by the United Nations and applicable to Germany and Abelian armed forces as a whole. The the tier, armed forces as a whole. The surrender of so much ter, which allowed the Allies to advance without opposition to within 10 m. of Berchtesgaden, hopelessly compromised the so-called 'south-redoubt' founded on Bavaria, to which the tiers, on the W. and E. Fronts intended to fall back after their forces had been split in two by the junction of the W. Allies and the Russians on the Fibels and Western Front in the Second World War.) The total number of Ger. prisoners taken by the Allies on the It, front before the end of hostilities was 230,000.

The New Zealand Div. occupied Trieste

on May 2, Gen. Freyberg accepting the surrender of the Ger. garrison. New Zeuland forces also occupied Gorizis. The zenna orces also occupied Corizia. The presence of Tito's and other Yugoslav troop- in part of Trieste and elsewhere within Italy's R. borders was, however, provocative of awkward territorial and political questions. Troops of the kighth political questions. Troops of the Eighth Army on May 7 crossed the It. frontier into Austria at a point N. of Udine This movement of the Eighth Army was now linked up along almost its entire course from N to S. with the line of the Russians' movement to the W. By the creation of this line a boundary was set up which marked the limit of Brit and Russian operations. This line ran from Liezen, buffy any between Klogendurt and Linz operations. This line ran from Liezen, half way between Klagenfurt and Linz, through Judenburg, Koflach, 15 m. W. of Graz, and thence due S. to the Yugoslav frontier. See G. Carr, Today—Haly the Tarpl., 1943; W. Italics, letters of it, origin, said to have been an imitation of the hand-writing of Petrarch. They were introduced by Aldus Manutius of Venice in the sixteenth Aldus Manutus of venice in the exteents century for the purpose of printing his projected small ed. of the classics. The cutting was entrusted to Francesco de Bologna. The caps, were square Rom. letters, but the small letters, sloping to the right, were designed to initate handwriting, even containing a large number of tied letters. Although 1. are not closed to each other in modern printing. joined to each other in modern printing. the ligatures or connecting lines at the beEngland in 1524, and are used to distinguish words, sentences, or sometimes such portions as introductions and prefaces which do not properly belong to the work. They are generally used for unassimilated foreign words occurring in Eng. text, for quotations, and for words requiring special

emphasis.

Italo-Abyssinian War (1935-36). conflict arose out of what was known as the Wal-Wal incident. A dispute between Ethiopians and Its. over the ownership of scattered wells in a sandy desert had led to fighting between it, and Abyssinan forces on Dec. 5, 1934 but, in its wider implications it was, or became, the focus of the international relations of the greater part of the world and, indeed, it would not be untrue to say that it was the virtual beginning of the Second World War in 1939.

It. claims to spheres of influence in Abyssinia, first made towards the close of Abysima, are made towards the close of the previous century, were nullified by Gen. Baratteri's signal defeat at Adowa (Adus) in 1896 at the hands of the Autharans, which resulted in a treaty signed at Addis Ababa recognising Abysiman independence. This disaster always makled in It., and one of Muscolini's motives in going to war was that of re-venge as well as to outshine the glory and complete the work of the Risorgmento. An Angle It. accord of 1891 had recognised the It. zone of influence over almost nised the It. zone of influence over almost all modern Abyssinia, but this and later agreements and treaties were superseded by still later agreements, and the whole position was governed by a tripartite treaty between Great Britain, France, and Italy (1906), the terms of which were largely determined by the Italo-Ethlopian Treaty of 1896 (see Abyssinia). But de-spite this settlement, it. foreign ministers had always schemed for the recovery of It. Influence, and these aspirations naturally influence, and these aspiratious naturally grew more marked after the conquest of Tripolitania and Libya, thus holding out the hope of a vast it. empire in N. Africa. the nope of a visit it. empire in N. Africa. Abyssinia, however, confirmed her independence by being admitted, with the strong support of Italy, a member of the League of Nations, whereby it became the duty of the League to assist the Ethnopian Corr set that it much days to the the strong the str Gov. so that it might develop the country's economic resources and improve the social welfare of its people. In 1935, how-ever, Mussolini charged the Ethiopian Gov. with failing to fulfil its special obligations as a League member, particularly in respect of arms traffic and slavery, and indeed, he made no secret of his intention to invade the country. The League on deavoured to stay his hand by setting up a committee to consider how to promote assistance for Abyssinia so as to secure administrative reform and economic development. The 1t. Memerandum of Sept. 22, 1935, in reply, called attention to the internal conditions of Ethiopia, and demonstrated the existence of an essential demonstrated the existence of an essential distinction between the countries of the anot. Amharic stock and the outlying recently-conquered areas, averring that the Ethiopian rulers had so exploited these areas for their slave trade that they

presented an urgent case for It. intervenpresented an urgent case for It. intervention and that, in any case, the authority of the Negus (Emperor) did not extend to such areas. The Committee then proposed certain territorial adjustments in Abyssima in favour of Italy in the vicinity of the Somaliland coast. Britain offering Zeilah (a port in Brit. Somaliland) to Abyssima by way of compensation. But the It. Gov. rejected these overtures and contended that Abyssimia was true when the It. Gov. rejected these overtures and contended that Abyssinia was incapable of respecting international agreements of any kind. It was now too late to stop the It. irvasion, but the League, faced with the necessity of implementing the muchadveitised Covenant (see Covenant of Fife League of Nations) now proposed to put recomming saudious into overstion. to put economic sauctions into operation against Italy as an aggressor State, and restrictions on trade with Italy were enforced six weeks after the invasion began. This naturally only served hopelessly to embitter Anglo-It. and Anglo-Fr. relations with out producing the desired result, and the next diplomatic move was the morally still worse Laval-Hoare plan for 'ex-change' of ter., which, in reality, was a one-aded transaction whereby Abyssinia was being called upon to make the sacri-fices and Italy invited to do the taking, and which contained an equally one-sided and which combined an equally one shoot proposal for a 'zone of economic expansion and settlement.' The League reported the plan, and the question which now came before it was that of oil sanctions of deaths step which Mussolini now came perors it was that of on same-tions, a drastic step which Mussolini and Italy would regard as an unfriendly at. The situation seemed the more grave from the very fact that the Brit, fiecd in the Meditgranean and the forces in Egypt had been greatly augmented, while the Fr. Gov. had agreed, in the event of an It. attack on the Brit. fleet, britain was not in a position to enter on a major war. 'Collective action 'was on its trial, but no prominent member of the League was anxious to make the first move, especially as the U.s. gov. declined to take any part in the move. Moreover tension in Europe generally increased by reason of Hitler's denunciation of the Locarno treaties (q.r.), a factor which, it was feared would have ropercuscions on the Abyssman war, Italy being a guarantor under those treaties. Peace feelers were now thrown out by the league, to which Italy returned an evasive reply, while Marshal Radoglio intensified he efforts to crush the Abyssinina forces before effective negotiations could thwart Italy's victory. The negotiations, howover, were not continued and soon afterwards hostilities coused with the fall of Addis Ababa in May, 1936.

Military Operations.—The It. invasion was launched on Oct. 3, 1935, Mussolini's war aim being to unite the hitherto solated It, possessons, Somalia and Entrea, by conqueing all or part of the intervening and ina pendent kingdom of Abyssinia. Hence he delivered his attack smultaneously on two fronts, though the only obvious objective, apart from the psychological import of capturing Adowa, was the railway, Abyssinia's sole route for imported supplies the campaign the war was waged in two separate zones, a N zone on the Abys sinian platoau, and a S E zone in the Gallaland Somaliland region including the Ethiopian ter of Ogaden The N zone presented the more formidable task, zono presenta the more formidante task, for the general altitude was 2000 ff and the country was ridged and knotted with a series of canyons deeply cut by water courses. The It advance followed the road taken by Napier in 1865 and by the defeated It expeditionary force in 1995 whice ever than those adopted by Graz along the F escarpment from the March

But during most of highlander, the It achievement of over-ar was waged in two running the country in seven months was, by the light of previous military experience no mean one, even if it was destined to ank into the commonplace after the brilliance of the Brit conquest of It E Airica under Gen Cunningham six years

MARSHAL DE BONO AND HIS STAFF AT AN OBSTRVATION TOST

P to Addis Ababa thereby avoiding the anyons and also the scoreling discom-forts of the Danakii Desert in the Rift Valley It was indeed the only prac-ticable routs for other and caser routes were fre luded by jungle and chirate In the 5 F zone the general confirmation of the Gallaland Somaliland argion some what favoured the invader because the what favoured the invader ickness the outer (st upment hampered supplies and troops going to Harar from 1) redaws on the Diriuti Addis Ababa tillway, nor was the invader opposed by either precipiess or torrontial rains. But the Scommander Graziani (q t) had to cross commander Graziani (et) had to cross and he only an open surf driven show on which to land supplies and a desolate country, to their the Ogaden a region devoil of any to vegetation other than scrub and yielding superior but seamty water Though the aeroplane battles and armoured car conferred great ad adapt (vantages over the ill-equipped Ethiopian) warfare

spraying of liquid poison gas from aero plate even more than the dropping of extle ive and incendary bombs, seems finally to have broken the morale of the Abysundan people behind the front, as well as that of the forces in the field By the time Badoglio resorted to gas on a large scale the Abyasinian troops on the N front had already learned the art of conceilment But the phosgene was deadly because it deprived the Abyssinians of the cover that nature had provided for of the Cover that nature had provided for them the bushes and forests being drauded with gas that clung to the woods and fields and valleys for days on end Moreover, the Abysinleans were not true to their traditional genius for mobility, and in face of an enemy whose overwhelming superiority in armaments made pitched battles hopeless, they failed signally to adapt themselves to effective guerilla

Gen. de Bono began three operations | simultaneously: an assault on Adowa, which was taken within a few days; an advance southward through Tigré; and and advance from Musa Ali near the Danakil Desert; while (traziani advanced through the Ogađen to menace the Harar plateau and the rollway from the S. But the Musa Ali operation dwindled away and Graziani's advance came to a standstill early in 1936. After four months he was little further advanced than when he started. Had the Abysinians at once exhausted thomselves in massed attacks the It. advance at this stage would no doubt have been much more rapid. Bande of Abyssinians from the Tembien mts. and Amhara carried out unexpected successful attacks, these regions not being included in the it, plan of campaign. Early rains, too, helped the Abyssimians; and the carlier air taids falled to impair the morale of the people. Moreover, It, hopes of detaching from Hallé Sclassié (q.v.) not only taching from Hallé Sclassié (q.v.) not out the recaletrant Tigrean Races, but also the grievously-oppressed non-Ambaran subject peoples, such as the Danakli, Somalis and Gallas, proved ill-founded for the most part, though the Wallo Gallas turned against their Ambaran overload and their disaffection had some influence on the war in the N. zone at its most critical states. critical stage.

Throughout the campaign the It. mum the casualties in the ranks of the It troops, as much as possible of the lighting being left to the airmen, tanks, and armoured cars. It infantry had to be armoured cars. It infantly had to be used, the hand to hand bayonet fighting was imposed mainly on African natives—Efficean conscripts and Somali or Librar mercenaries. The total death-roll was It, troops of African race, 1593; It, workmen, 153; It troops of It, race, 2313 of which number at least 1000 died of accidents or sickness. The Abysinians could mobilise a million men; but the could mobilise a million men; but the Imperial Guard, trained by European officers, only numbered 30,000 of the total. and even these had had only the most elementary training in W. methods of war fare. The rest of the forces were feudal levies raised by local chiefs, lacking training in modern weapons. It is be training in modern weapons. It is be lieved that they had no more than 100,000 modern rifes, about 500 machine-guns, and no artiflery. When the advance began Grazian had only two divs, at his dis oralism and only two dive. at my divergence of the it. forces, for political reasons, being concentrated in Eritrea mainly with the view of wiping out the ignominy of Adowa in 1896,

and advanced on Adova, while their planes raided that the and Addi Grat, the latter being occupied next day. A little registance was met between Addi Grat and

throughout Italy. The absence of effective opposition from Ras Seyum lent plausibility to the It. propagandist version that their invasion was in the nature of a praceful occupation of a countryside, whose people were easerly awaiting liberation. During the halt after Adowa It proclamations were issued announcing, inhr alia, the abolition of slavery and the suspension of customs tolls. As a result detections of inhabs, during the first fow weeks were on an extensive scale. The weeks were on an extensive scale. The most notable desertion was that of Dejazmak Hallé Sclassié Gugsa, governor of the E Tigré and son-in-law to Hailé Selassié, the Emperor, who is said to have bitterly resented the appointment of Ras Seyum to the command in the Tigré, and de Bono rewarded him with the appointment of Rus of the Tigré.
On Oct. 15 a deputation of priests

handed to de Bono the keys of Arum, the hely city of Abyssinia, which, according to tradition, still held the Ark of the Covenant, brought from Jerusalem by the Queen of Sheba. When the next general move forward began on Nov. 3 towards Mikalie, 35 m. distant, neither Ras Seyum nor ites Kassa of Amhara offered any opposition; but it took the Its five days to over the journey, heavy rains complicating their transport problems. There now ensued another prolonged pause for road construction and consolidation of ground occupied. But this tardy mode of campaigning did not please the It. gov. or Italy and de Bono was superseded as High commissioner and Commander-in-chief by Marshul Badoglio, Chief of the It. teneral staff, and the most distinguished It soldier of the time. Time was of the essence of the campaign, for the League had just then decided to impose economic sanctions on Italy as an aggressor, and de Bono's Fabian tactics were unsuited to the altered conditions. Badoglio soon showed that the invasion was the reverse of a peaceful colonial enterprise, and he made no effort to conciliate the mha ss. of the occupact zones, an attitude what a selector events proved, heralded the adoption in March of the next year of the policy of nuclifulness. On Dec. 8, the Its. occu-pied Abbi Addi, cap of the Tembien, a of rusped heights, cliffs and ravines which the its, never really succeeded in combing or morphing up. Elsewhere on this front the it. forces consisted of little more than scattered outposts.

By Dec. the Abyssman forces had been strengthened by the arrival of Ras Mulugeta, War Minister and an Adowa veteran, with deta huents of the Imperial courd. The first really serious engage ment of the war on the N. front began on out the ignominy of Adows in 1989.

The Campaign in the North.—At 5 A.M. toward. The first really serious engagement of the war on the N. front began on Oct 3, 1930, the first detachments of ment of the war on the N. front began on the It forces in Eritrea crossed the March | Dec. 15 on the It, hight, where Abyssinian advanced on Adowa, while their detachments from the forces of Ras Imru, and crossed the Takgovernor of Gojjam, had crossed the Tak-azze riv. in an attempt to turn the It. dank. The Hs. were driven back 15 m. Adows, but on the morning of the fith, and the Abys-linens, pressing hard upon when the Its. entered Adows, they found that the forces of Ras Seyum, Commander in the Tigre, had retreated during the night. The capture of the tn. was, howinght. The capture of the tn. was, howinght. The capture of the tn. was, howinght. The capture of the tn. was, howinght in reoccupying Abit Addi at a heavy loss and gained control of the Adows-Makalle road, thus leaving their foe in a dangerous this sector, regained most of S. Shre by the end of the year. They also succeeded in reoccupying Abbi Addi at a heav y loss and guined control of the Adowa-Makalle schient at Makalle, with the prospect of the May rains precluding any further advance. But Budglio had made good use of the pause in constructing roads and in re-organising his forces. When he took the initiative again he proved the equal of his foe it mobility and much his superior in strategy and in armanicuts. In the second week of Leb 1936, he alvanced twith a speed which surpassed all expectations and which he maintained till the end if the mobility of his forces not being affected to any extent by rain Several expectations and which he maintained till the first tenglish and sources and labour corps. Early in the previous month Mulugeta occupied Amba Aradam a mt 12 m S of Makalle thereby blocking the way to Amba Alagi and supporting Ras kassa and Ras Sevum in the Temblen. Then followed a five day battle in the Temblen (Jan 19 23). There were repeated attacks and count is attacks by both sides particularly at the Warleu Pass, N of Abbi Addi, which was held by It Blackshitts.

were massing their forces in order to con test any further It advance tactics which were certain to play into the hands of their scattered the It use of artillery and air bombardment was much restricted. The battle of Amba Aradam (Feb. 11.15), fought in most intricate country was a disastrous defeat for Mu'ugeta who did not foresee that Badoglio would attack on both flanks and so surround him By Feb 15 Ras Mulugeta and the remnant of he of the state of the results of the remnant of the remnant of the same were fighting the results of the resul little doubt that Vulugeta's d cision to hold Amba Aradam was the turning poin in the fortunes of Abvasinia for while the It advance could have been checked, it is evident that the defeat of the Imperial Guard accelerated the Abyssinians' dis-The First It Army (on 4 their morale cantions advance on Amba Alagi a strong natural position whi h was held in considerable force, but owing to the treachery of the suborned Gallas and other tribesmen the flanks of the loyal Abyssinian tribesmen forces were left exposed and the position fell on Feb 28 Meanwhile the Third Corps moved west wards and secured control of the main line of communication from Desaye the Emperor's hadquarters, to the Temblen The force of Ras Kassa and R is Seynin numbering 30 000 men were now thus al numbering 30 000 men were now thus armost entireled from the S by the Third Corps, from the N F by the Eritrean Corps, which had been guarding communications from Makalle, and from the N.W by both the Second Corps based on Axum and the Fourth Corps of new rein forcements. The Abyssinians were driven out of their fortified posts after fierce fighting and beavily bombed as they re treated to the fords of the Takazze Ras Kassa and Ras Seyum, with the remnant

resume their agric pursuits—made their way southward and, later joined up with the Imperor's forces near Lake Ashangi. The Second and Fourth It Corps now converged on Ras Imru in S Shire, using a good deal of polyon gas. The Abyssin ins field across the Takazo with heavy loses. The way was now open to heavy losses The way was now open to Badbello for an advance towards Lake In and by mid March the Its had cross d the Takazze combed' the comen massif, and entered Walkait are the Setif R. At the same time an It column of 5000 men left Asmara in 10 m tor vehicles to make a lash on Gendar They reached then goal over 0 m of difficult terrain in two weeks. but an ountered no resistance On April 12 the It flag was hoisted on the N shore of I ake Tana and in (hallabat The First and Third Corps were also rapidly advancing S towards I ake Ashangi, while the Third Corps was moving from Abbi Addi towards Sokota an important junction. The main Abveshitan aimy, under Halle Selasue hinselt was posted near kworsm S of I ake Ashangi. The emperor had left Dessye and come N in the hope of rallying his forces. But the m tale of the Abveshitan was orumbut encountered no resistance On April the male of the Abysenians was crum-bling a net the terrible waspon of mu tart gas, dropped in containers or spray d from aeroplanes over soldiers and civilians indiscriminately and over the undergrowth in which they sought a lat despetate stand against the Its advinging on Lake Ashingi and on Sokota toy a la the end of March Anticipat ing Badoglio s pincer movement the with 20 000 men and attacked the First It Corps at Mal Con above the lake (Mai h 31) The Abyssinians displayed grid gallantry but as haw been seen, pitel I battles were hopeless against not a Turopean forces. The fight man is the fifth pitel the typismians holding their ground against gun and air bombardment with forlorn tenacity, finally decing in disorder to Dessye, bombe I by aircraft along the road Some of the I mperor s own secretaries and closest collaborators were in the pay of the Its is is borne out by the accuracy with whi h the Its were able to forecast the Fupror's moves and send bombing planes wherever he went in an attempt to kill him. The persistence with to kill him The persistence with which they attempted to get rid of the I m; for and the eventual results of his deputure from the scene justify the view that the whole I thioplan structure de-pends I on him personally and would collapse if he were killed or temoved Desaye, occupied on April 15 now became occupic i on April 15 now Builogh a headquarters Dur During the month Addis Ababa was often visited by It planes. No bombs were dropped, but the machine gunning of the aerodrome and the tales of defeat brought by stragglers from the battlefields deepened the gloom of the though the action. of the inhab, though they still seem to have entertained hopes of assistance from the League of Nations. When that hope

vanished, a proclamation was issued calling on all males to report for military service. On April 30 the Emperor returned to his cap together with Ras Kassa and other generals, just after the Its. had succeeded in piercing the S. defences. The failure of the Emperor's appeal for recritis on May I. coupled with attacks on rainte of the Emperors appear on cruits on May 1, coupled with attacks on his life by his subjects turned brigand, broke his will to further resistance. He had already arranged for the Empress and his family to leave the country, and at the last moment he decided to accompany them. One of his last orders was that his palace should be thrown open in order that the people of the city might take its contents. The result was a vulgar orgy contents. The result was a vulgar orgy (May 2-4) of looting, rioting, and burning, which involved more than five hundred deaths, including some foreigners. It was not until Marshal Badoglio made his triumphal entry into the city on May 15

that order was restored.

The Campaign in the southern zone.— The The Campaign in the southern sone.—The chief objective of the army on the S front was the occupation of Harar but Graziani was hampered by the smallness of his forces and his long lines of communication based on Mogadishu and Bandar Qasin 'i. main body of the Ethiopian army in the S was concentrated round Harar and Jijiza under Dejazmak Nasibu. Dolo, near the Kenyan frontier, was occupied at once in order to hold Ras Desta in check. By the end of Oct. the whole of the region between the Webi Shebeli and the Fafan. S. of Gorahel, was in It. possession. The of Gorahei, was in It. possession. The fall of Gorahei (Nov. 7) was due largely to air raids, and this nan a decoder.

effect on Abyssinian morale. But on
Nov. 11, the Abyssinians won a con
siderable action at Anale, 30 m S of the
important Abyssinian post of Dagga Bur,
bushing a number of It tanks. This air raids, and this had a decidedly adverse defeat, coupled with the rains, led to an It. withdrawal all along the line, while Ras Desta, litherto inactive, began an ad vance on Dolo so as to divert it. attention from their drive northwards. In mid Dec. the main body of his troops were located by aeroplanes 150 m. N.W. of Dolo. An air attack took place near Negelli and Dagga Bur was bombe devery day. The ensuing pause enabled Graziani who had made a leisurely descent from the highlands on Grazian's rear, delayed over-long in country where his enemy could make the best use of his modern armament and transport. But despite gallant rearguerd actions, the attacking Somalis, Askaris, and It national troops proved too much for them and they were finally roated by It. tanks in the rear and they were similar roated by It. then subjected to aerial bombardment in their headlong retreat into the Sidamo footbills. Mechanised It. detachments arrived in Negelli, 210 m. from their starting-point, on Jan. 20. This victors and the occupation of Negelli, besides removing the threat to his flank and to his communications, allowed Graziani to ad vance northwards as soon as weather and other conditions permitted. Moreovér, Adriatic, Its greatest length, measuring the advance was a valuable political set-

off to de Bono's delays in the N. campaign: and though it was not strategically paign; and unough it was not strategreally of much importance, if fully served its political purpose. Graziani now spent his time in consolidating his hold over the country between Dolo and Negelli. When, at the end of the month, the It, advance the second of the Abrestians had seed to be a was resumed, the Abyssinians had greatly strengthened their defences before Jijiga and Harar with deep entreuchments, redoubts and machine-gun posts, which system of defences became known to the Its. as the Abyssinian ' Hindenburg Line. Its, as the Abyssinan innernous Line. Both these the, were heavily bombed from the air with incendiary and explosive bombs, though Haiar had been prochained an open th. The Its, now advanced up the valleys of the Webi Shebeli and the Fafan, and by April 27 they were in possession of the Abyssinian 'Hindenburg Line.' There was, however, fleree fighting near Sasa Baneh, both sides suffering heavy lossos and Graziani had to call a halt, owing to the exhaustion of his men. The Abyssinian position, however, threatened as it was in the rear with a possible attack by the It army in the N. was hopeless in any case, and till more so if they delayed too long in the 'Line.' On April 29 Sasa Baneh and Bulale were On April 29 Sasa Banen and Busine were captured by Graziani after desperate tighting, the occupation of these two places marking the final collapse of the Abvasimans in the S. The further progress of the It. troops was checked by heavy rains, but by May 8, they reached Harar and by their arrival saved the city from the locating and burning that had from the looting and burning that had marked the abandonment of Addis Ababa.

Later, Hailé Selassié went to Djibuti and sailed for Palestine. Soon afterwards the It gov. announced that Italy had annexed all Abysqinia and made Victor Emmanuel

all Abyssinia and made Victor Emmanuel its Emperor. Five years later, following the brilliant Brit. campaign in R. E. Africa, Hailé Selassié re-entered Addis Ababa as Emperor. Italy, republic in the S. of Europe, compilsing the peninsula which extends sonthwards from the Alps Into the Mediter.

wards from the Alps into the Mediterranean Sea, together with the is, of Sicily, ardinia, Elba, and various small is. The Aips form a semicucular barrier which separate it from the continent of Europe, from France on the N.W., Switzerland on the N. and Austral on the N.E. its boundary on the W. is that portion of the 710 m., its breadth ranges from 354 to 20 m., having an average breadth of about 90 m. The total area of I. was estimated of the total area of 1. was estimated (1945) at 310,000 sq. km or 119,660 sq. km of which 100,480 q. m. are accounted for by the mainland, exclusive of Sicily (1935 sq. m.) and Sardinia (9299 sq. m.). N.I. is cut off from the rest of the peninsula by the Apennines, which branch sula by the Apennines, which branch off from the Maritime Alps E. of Nico, and run in a S.E. direction from the guif of Genoa to the Adriatic Sea. The range then turns more to the S. near Ur-bino, and extends as far as Capo Spar-tivento in the 'toe' of the peninsula, thus forming the backbone of Central and S. I. It is convenient to consider the peninsula under these three divs. : N., Central, and S. N. I embraces the provs. of Liguria (Riviera of Genoa), Pledmont, Lombardy, Emilia, and Venetin, including the Tren tino. Lying between the Alpa and the upper Apennines is the wide plain which form the basin of the Po. This is that in all round from Mentone to the gulf of all round from Mentone to the gulf of Trieste by the towering Alpine wall, called from W. to L. the Maritime, Cottian, Graian, Pennine, Helvetian, Rhatian, and Carnic Alps. The highest point is the Grain Paradiso (13,652 ft.), a peak of the Graian Alps. The loftiest auminits of the Alps are not included in It. ter. To the S. of the Alps, in the N. of Lombardy and Veneta, lie the beautiful It. lakes, Lago di Garda, Maggiore, Como Lugano, and Venetia, he the beautiful it. lakes, Lago if Garda, Maggioro. Como Lugano, and Orto The tertile plain of Lombardy, as already mentioned, is watered by the Po, which rises near Monte Viso, and is enriched on its way to the Adriatic by numerous tribs, and mt. torrents. The prov. of Venetia, to the N. and E. of the Po, is traversed by the Adige, Brenta, Plays and Taghamento. Along the coast Plave, and Tagliamento Along the coast of the Adriatic, N and of the Po delta, there exist large tracts of salt water, known as lagoons, in a flat and marshy dist. They are separated from the sea by narrow banks of sand in which are inlets, so that the lagoons serve as harbours. The chief of these is that on which Venice is stuated. It extends over nearly 10 m from Torcello in the N., Chloggia and Brondolo in the S. The W coast-line of N. I. is formed by a myrow strip of land, closed in by the steep abrupt rocks of the Appennines, and known as the It. Riviera.

Geography.—The geography of Central and S. I is mainly determined by the Apennine range, which, sloping across the head of the pennsula as well as down its length, extends for about 750 m. The culminating point of the border range between N and Central I. is the Monto Cimone (7110 ft.) The Apennines in Central I. The Apennines in Central 1. are broken up into many short lenges, particularly in Tuscany. The chief peaks are Monte (atria (5590 ft.), Monte della Sibilia (7663 ft.), Monte Vettore (8128 ft.), and Pizzo di Sevo (7945 ft.), while the culminating peak of the whole range is Monte Corno (9577 ft.) in the Gran Sasso d'Italia. Central I according to the woneral div. Central I.. according to the general div., comprises the five provs. of Tuscany, Rome, Umbris. Marches, and Abruszl. The first named is watered by the Arno,

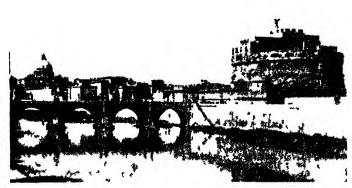

Cocina, and Ombrone, all rising in the Etruscan Apennines and flowing into the Tyrrhenian Sea. But the most important riv. of Central I. is the Tiber, the riv. of Rome, which is navigable for 90 m. The chef lakes of this region are the Lago di Colano and Lago Trasimeno, while the Lago di Bolsena, Lago di Vico, and Lago di Braschue converte the return of extinct di Bracciano occupy the craters of extinct volcances. The volcanic tract extends from the Monte Amiata (5890 ft.) in Tus-cany to Vesuvius (nearly 4000 ft.), a detailed and active volcano in Campania. On the W. the Aponnines slope down to the Pontine marshes, S. of Rome which is connected with the Terra di Lavoro, the plan of Campania, and on the E. to the broad Apullan plains. The prove of S. I. are Campania, Apulia, Basilicata, and Calabria. The main ridge of the Apen-nines is continued due S. by the Monte della Maddalena, culminating in the Moute Pollino (over 7000 ft.). The low Monto Pollino (over 7000 ft.). The low hills N. of the Gulf of Taranto, between the 'heel' and the 'toe' of I., are of Pllocene formation, while the Calabrian Hills are a broken limestone range where thing are a broken innestone range wines the height rises to 6000 ft in La Sila, a densely wooded granite mt., the highest peak being Aspromonto (6420 ft.). The rives of S. I are not of great importance, The Garigliano those in a westerly direction with the mile of the table of the state. to targrish olows in a westerly direction into the gulf of flacts, about 15 m. from the mouth of the Volturno. The Sele is a short river flowing into the gulf of Salerno. The chief rivs which flow into the gulf of Taranto are the Agri, Vasuate, and Bradano. The rivs, of the the Foglia, Metauro, Frino, Chienti, Tronto, Sangro, Trigno, Biferno, Fortore, Cervaro, and Ofanto. The coast-line along the Adriate is practically unbroken but for the properties. but for the promontory of Gargano. The is of I.—Skilly, Sardinla, Elba, the group of Lupar Is N of Skelly, Giglio, Capri, etc.—are dealt with in separate articles. The harbours of the Adriatic are Venice (pop. 303,200), Ancona (90,000), Brindial (42,000) Borletta (46,000), and Bari 303,200), Ancona (90,000), Brindisi (42,000) Burletta (16,000), and Bari (197,100); the large harbours belong to citics of the W. shore (Jenou (pop. 619,300), Spezia (111,700), Leghorn (123,700) Civita Vecchia (23,100), Naples (99,000)—and in the S is the ine harbour of Taranto (180,800). The cap. of I is Rome (pop. 1,573,900), and its prin. inland that are Turin (702,000), Muin (1,270,000), Verona (162,900), Muin (1,270,000), Verona (162,900), Modena (112,700), Bologna (279,200), Florence (331,300), Pisa (67,000), Lucca (79,100), Slena (47,815) Perugia (137,500) and Potenza (16,000)

(timate.—The climate of I, is in general hot, but is tempered by the long coast-line, while on the uplands it is cool and pleasant. There are great differences in temp. and atmosphere between N. and S. I. The plain drained by the R. Po has the nost extreme cold, while the It. Riviera enjoys a warm, sunny climate all the year cound.

Riviera enjoys a warm, sunny climate all the year round. The Adriatic coast is ex-posed to biting N.E. winds, but Tuscany and Rome, and the greater portion of the

W, half of the peninsula, enjoy a mild winter and have a very hot summer. The rainfall during the summer months is alight but there are heavy rains in late autumn. A large portion of I suffers from malaria, the chief areas so affected including the same field in one than the chief areas so affected including the same field in one ing the marshes of Grosseto and Orbetello

which cannot endure the trests of winter Along the Rivera of Cenea the climate is extremely fivourable for the growth of olives our ges Lunons, dite palms, and altron trees which are also found in great profusion in the 5 the mulberry begrown extensively in Tuscany and else where, and there are many analysing of the lower slopes of the Apendines. In sugar cane (otton plant, prickly pear pomegranate all flouish in the warmer regions in the forests and on the mi sides are found the chestnut, express laured sides are found the chestnut, vpress laured myrtle, of ander, arbutus, and evergreen cak. Agriculture is the chief industry of the country about 70 per cent of the total area of 1 being under cultivation. The principal corn crop is wheat mearly rand certain wares and incoming under cultivation are the manufacture of thread, cotton wood chemicals, integriss and incoming a design of the manufacture of the area of 1 being under cultivation from the large that industry and certain wares and industries are the manufacture of all industries are the manufacture of

The best known varieties n lum cheese the Cheese are Gorgonzola's racoltino and Paimesan. A great variety of fruit is grown-orange, tenoor figs peaches, appears and prickly pear. Ulmonds are ding and hazel nuts p stachles walnuts, where, and there are many vineyards on an i chestnuts are among other products the mulicry tree i cultivated on account of its leaves which serve as food for ni worms. The breeding of silkworms is of importance in the provinces of Lom-bardy Picdmont and Chetia, where silk

sulphur, zinc, mercury, coal, iron, and lead. The production of coal is unimportant, and its use is largely replaced by water-power and electric-power gonerated from water. The growth of industry is due to the latter. Under the Fascist regime the commercial and industrial policy was directed towards the developpolicy was directed towards the development of irrigation and drainage, land reclamation, application of agricultural research, reafforestation, building of houses and roads, anti-malarial campaigns, etc. In the fishing industry only the sardine and tunny fishing is of importance. The chief imports are foodstuffs, coal, iron, hides, rubber, and silk-cocoms. The chief exports are fruit (dried and tresh), wine, olive oil, hair, straw hats, worked coal, raw silk, cotton tissues, and silk tissues. tissues.

Communications.—The construction of railways dates from 1839, when a line was opened from Naples to Portici (5 m.). Now there are two main lines running the entire length of I. along both sides of the Apennines and connected with the lines of the N. plain, together with numerous minor lines, the total length, including the lines in Sardinia and Sicily, being (1939) 11,500 m. The main lines (11,000 m.) are under State control. The electrification of railways has been carried out in recent years, and by the beginning of the Second World War over 3000 m, of public and private line were electrified, excluding the electric tramway system, which covers electric transway system, which covers nearly 3000 m. Before the war there were some 2000 electric locomotives and 2500 steam locomotives. By the end of the war this number was reduced to 400 and 800 respectively with a corresponding and our respectively with a corresponding decrease in the number of serviceshie coaches and wagons. The total mileage of roads is (1940) 127,000 m., of which 13,500 m. are State roads. Telegraph lines cover some 42,000 m., and there are 10,000 telegraph offices with 11,000 post offices. The prin. canals are in the valley of the Po. connection Milan to the Po. offices. The prin, canals are in the vancy of the Po, connecting Milan to the Po, Adda, and Ticino. The delta of the Po is so much obstructed with sand that navigation from the sea to the riv. is carried on by means of the three canals, Canale Bianco, Po di Primaro, and Po di Volano. The mercantile marine included (1939) 2300 salling vessels of 100,000 metric tons, 1060 steamships of 1,600,000 metric tons, and 300 motor ships of 380,000 metric tons. The total tonnage of the mercantile fleet was over 3,000,000 metric tons in 1939. By the end of the Second World War this was reduced to 500,000 metric tous, chiefly fishing vessels; in 1916 the tonnage of sea going vessels (123) was

Population.—At the first general census (1871), taken after the unification of the kingdom, the pop. was 26,801,154. In 1881 it had increased to 28,459,628, and in 1901 to 32,965,504. In 1910 the pop. was estumated at 34,947,865, and in 1921 at 38,7 ic,433. Under the l'ascist régime strenuous efforts were made by the gov. to keep up the birthrate and celibacy was

census to 42,993,602; and was estimated in 1947 to be 45,646,000 (excluding Venezia in Giulia and Zara), an increase of 2,652,000 over the 1936 total. Accordof 2,652,000 over the 1936 total. According to this census the population was distributed among the regions as follows:—Lombardy, 6,298,000; Veneto, 4,654,000; Sucily, 4,356,000; Canupania, 4,175,000; Piedmont, 3,580,000; Canupania, 4,175,000; Piedmont, 3,580,000; Aprilla, 3,277,000; Calabria, 2,006,000; Aprilla, 3,027,000; Calabria, 2,006,000; Abruzzi e Molise, 1,687,000; Likuria, 1,506,000; Marches, 1,352,000; Sardinia, 1,196,000; Venezia Giulia e Zara, 977,257; Umbria, 780,000; Venezia Tridentina, 689,000; Lucania, 543,362. For the pop. of tns. see above 543,262. For the pop. of the, see above under Geography.

Government.-Formerly a constitutional monarchy I. was declared a republic as a result of the referendum held on June 2, 1946. The Constituent Assembly consisted of 556 deputies, elected by popular suffrage at the General Election also hold suffrage at the teneral election also noun on June 2, 1946, and was then the sole legislative body. The Senate which existed under the monarchy was abolished. The Constituent Assembly which came into existence for a period of one year, later extended to eighteen months, then assumed the task of framing a republican

constitution.

The new constitution was passed by the Assembly by 453 votes to 62 on Dec. 22, 1947 and came into force on Jan. 1, 1948. The first Article describes I as 'a demo-cratic republic founded on work 'and emcratic republic founded on work and emphasies the constitutional sovereignty of the people. Parliament consists of the Chamber of Deputies and the Senate. The Chamber is elected for five years by universal and direct suffrage, on the basis of one deputy for every 80,000 inhabs. Deputies must be at least twenty-five years of age. The Senate is elected on a regional basis, seek perion having at least six senators, one for each 200,000 inhabs. (the Valle d'Aosta has one senator only). The President of the Republic, who is himself a senator by right and for life, can nominate six senators for life from comment men in the social, scientific, artistic and literary spheres. The Presi-dent is elected in a joint session of the two houses, to which are added three delegates from each Regional Council (one from the Valle d'Aosta). A two-thirds majority is required for election, but after three in-decisive scrutinies, an absolute majority is sufficient. The President must be at least lifty years of age and his term is seven years. The President of the Senate acts as his deputy. The President is empowered to dissolve the chambers of Parliament, except during the last six months of his term of office. The defeat The defeat months of his term of office. The defeat of a gov, bill does not involve the re-signation of the gov., which can be com-pelled to resign only on a motivated motion of censure. For administrative purposes I. is divided into nineteen itegions, each Region being sub-divided into provs, and come. The organs of the Regions are the Regional Council, the Junta (executive), and the President of the Junta. A cov. compassioner superpenalized. In the 1931 census the total Junta (executive), and the President of had risen to 41,176,671; in the 1936 the Junta. A gov. commissioner super-

vises and co-ordinates the regional ad-Sicily, Sardinia, Trentino-Friuli-Venezia Giulia and ministration. Alto Adige, Friuli-Venezia Ciulia and Valle d'Aosta have been granted special statutes of autonomy. A Constitutional Court, consisting of fifteen judges—five each being appointed by the president, Parliament in joint session and the Supreme Law Court—has rights similar to those of the Supreme Court of the U.S.A. It is empowered to decide on the constitutionality of laws and decrees, define the powers of the State and Regions, adjudicate on conflicts between the State and Regions or on inter-Regional conflicts, and try the presi-dent of the republic and the ministers.

The reorganisation of the Fascist party is forbidden. Members and descendants of the House of Savoy are excluded from all public offices, have no right to vote or to be elected, and are forbidden to enter to be elected, and are infinited to the state. Titles of nobility are no longer recognised, but those existing prior to Oct. 28, 1922 (the date of the Fascist march on Rome') are incorporated as

part of the name.

Defence.-- Under the Fascist regime military service was compulsory and uni-versal for men between the ages of 21 and 35. The army was divided between the Metropolitan Army with a normal peace time establishment of 200,000, and the Colonial troops. At the beginning of the Second World War a million and a half men were mobilised including 132 battalions of the Black Shirt Militia, normally part of the Voluntary Militia for the National Security (M.V.S.N.). The Cara-National Security (M.V.S.N.). The Carabinieri, or military police, numbered over 50,000 in 1939. The navy with a personnel of 4000 officers and 75,000 men consisted, in 1939, of 6 battleships, 20 ornisers, 52 destroyers, 63 torpedo boats, and 90 submarines. The battleships of and 90 submarines. The battleships of the Littorio class had a standard displace-ment of 35,000 tons and carried 9 litteen-in., 12 six-in., and 12 three-point-five-in-guns. The air force, including army co-operation units and the naval air arm, mustered 2000 first-line aircraft in 1939 with 400 reserves.

with 400 reserves.

Under the provisions of the Peace Treaty (1947), the army is hmited to 250,000 men, to include the Carabineri with a strength not exceeding 75,000 The 35,000 ton battieship Italia (formerly Lattoria), and the Vittoria Veneto, the 33,000 ton battieship finite Cesare, 7 cruisers, 7 destrovers and other vessels were surrendered to the Allies. Eight submarines were also surrendered, and the remainder destroyed. The post-war navy consists under the Peace Treaty of two 23,000 ton battleships, 5 cruisers of not more than 7000 tons, 4 destroyers, 15 torpedo boats, 20 corvettes and mine-sweepers. The total strength is limited to 25,000 officers and men. The air force including the naval air arm is limited to 200 fighter planes and 150 planes of other types. with a maximum personnel of 25,000. Bombers are forbidden under the Peace Treaty.

Finance.—Under the Fascist regime the taxation system and the lovying of is fortunate in its univ. life. There are

taxes were simplified. To maintain family fies and encourage capital, death duties were abolished while, for many transitory taxes, more permanent sources of revenue were substituted. Among sources of revenue were substituted. Among sources of revenue other than taxation and excise and customs are state monopoles, state railways, and stamp duties 1. entered the Second World War with an internal debt of 200,000 million lire and a defleit of over 12,000 million lire, of which 5700 million were in the ordinary budget and 6500 million were extraordinary accounts, the military extraordinary accounts, the military extraordinary accounts. traordinary accounts, i.e., military exigencies and the development of the empire. At the end of the war the in-ternal debt stood at 850,000 million lire. For the fiscal year 1946-47 the deficit was 610,000 million lire, and for the following vear revenue was estimated at 520,000 million life and expenditure at 832,000 million involving a deficit of 312,000 million.

Education.—Education, controlled by the State, is under a minister, assisted by a council. Primary education is free and a council. Prinary cancation 14 free and compulsory, and the state also maintain-partly or wholly, secondary, technical schools, and the universities. Education was the primary concern of the Fascist gov, and the education theories of Prof. Gentile were put into practice. Under his system, educational programmes were had down, but the teachers were free to arrive at the results therein determined by their own methods. There was, how-ever, no departure from Fascist principles, which were further inculcated through the youth organisations, the Bailla for boys from the ages of five to fifteen and the aranguardisti from fifteen to eighteen. The subservience of education to the Fasent state was completed by the so-called School Charter (Carta della Scuola) of 1939, education of women was discouraged and co-education forbidden. With the overthrow of Mussolini education was freed and enabled to return to its liberal The reorganisation of educatradition. tion was one of the most difficult problems in 1 in 1945. Owing to some extent to the outbreak of war the School Charter had mover really been operative, and school life had subsequently become thoroughly disorganised, partly on account of a lack discremised, party on account of a lack of teachers, and party owing to the de-struction of numerous school buildings in the war. With the restoration of peace it was found possible only to allot one school-house to two schools, so that each applications of the schools are the schools. pupil had only half a day's education from the state. Often the political party organisations provided lessons and, with the co-operation of U.N.R.R.A. (q.w.), a meal during the hrs. left free. This linking of politics with social relief was a dangerous inheritance from fascism but it was essential to seek relief where it could be Among reforms most discussed in found I. today are the extension of elementary cleasical secondary-school education. I.

over twenty univa, most of them supported by the state Many are of very anot foundation. The univa of Bologua, Genoa, Macerata, Napica, Padua, and Perugia date from the thirteenth century, and those of Eurara, Pavia, Pisa, Rome, and Siena from the fourteenth. When the end of the wai brought the students back to the univa these became more over-rowded than ever before. Thus, in the academic year 1943—46 there were nearly 32,000 at Rume, 20 000 at Milan 12 000 in rum, 11,000 at Bologua and 10 000 at Bari.

Religion - The Rom Catholic Church is re organised as the State (hurch, but toleration is granted to all creeds Over 97 per cent of the pop is Rom (atholic By the Act of 1871 the rank of the pope as a sovereign prince is accognised, the Vatican and Lateran palaces and the papal villa at Castel Gandolfo having the privilege of exterritoriality Chiz cleav privinge or exterritorially limit class age between Church and State had hin dered the un fication of I, and under the monatch, the Rom Question was a source of political difficulty. But on Feb 11 192) Muscolin signed a treaty. a concordat and a financial convention with Cardinal Gasparri the papal secre tary of state for Pope Pius XI. The law of Papal Guarantees was abolished, and the pope recognised the It kingdom under the Savos dynasty Rome being the cap the Vatican was maintained and the Peter's and the Vatican palaces became The sovereignty of the Papacy over can City (qv) In the summer of 1931 another rupture occurred between Church and state over the nature of the Azione Cattolica but an agreement was arrived at on Sept 2 The pope also has juite at on Sept 2 The pope also has juris diction over the Latran, the Palvzo della Cancellaria, the residence of the Cardinal Vicar, and the Papal Villa By the concordat, the right to appoint It bishops remained with the Holy see but newly appointed bishops were to take the oath of allegiance to the king. By the financial convention, I paid the Holy see 750,000 000 lire together with a per cent bonds to the nominal value of 1,000,000 lire

In the newly formed republic, the post in of the papacy was not defined until the passing of the construction of the 22 1947, though before that date a strong body of catholic opinion was in favour of renewing the concordat in the new constitution. In the result to treaty of the 1929 we confirmed by art le 7 of the constitution, laying down that the Catholic Apostolic Rom religion is the only ningen of the state. Other creeds are permitted, provided always they do not prot spinciples, or follow rites contary to public order or more il he haviour The profession of such creeds i free, and discussion on religious matters is freely admitted in practice, however, protestants labour under many disabilities. The appointment of archibishops and bishops is made by the Holy See, but before proceeding to such appointments the Holy

See submits to the gov the name of the proposed appointee in order to obtain an assurance that the gov will not raise ob jections of a political nature (atholic religious teaching is given in elementary and intermediate schools Mariages may be solemined before a Catholic clir, man in accordance with the rules of canon law, or before a clergyman of any other religion admitted by the state Mariages on also be concluded before a rgistiar Peligious statistics of the 1931 census show Rom Catholics, 31 011,000 Protestants, 83,600 Jews, 74,300 atholics or of no telligion, 17 000

to rise in power and to gain some degree of independence. The saxon emperor encouraged this spirit of municipal independence which crushed the power of the turbulent counts. His son and grandson, Otto II and Otto III, however, had not his powers of discipline, and on the death of the latter in 1002 Ardom, Marquis of Ivrea, claimed the crown and was supported by Lombardy and Pavia. The saxon dynasty, however, continued in Henry of Bavaria, who gained the alliance of Milan, and crushed her rival, Pavia. On Henry's death in 1024, Heribort, arch bishop of Milan, offsted the Crown to Conrad, the Franconian king of Germany During this century there should be noted.

elections.

During the ensuing three decades the N. cities were each a single republic; the bishops were superseded by consuls, who, assisted by a council of burghers, adminis-tered the law. Rome shook off for a time the sway of its bishop, and under Arnold of Brescia estab. a republic with a scuate on the lines of anct. Rome. On the death of Courad, his nephew Frederick, surnamed Barbarossa, was elected emperor. Under his rule the old feud between emperor and pope was renewed. He crossed the Alps in 1154, determined to exercise his immerial rights and to nut an end to the the Alps in 1134, determined to exercise his imperial rights and to put an end to the warfare of the cities. Milan at once rose up in arms against him, but Frederick, after laying waste some smaller cities, marched on Rome and was crowned by Adrian IV. (Nicholas Breakspear), the only pope of Eng. birth. He marched upon Milan and forced it to surrender But in 1159 Milan was again in revolt, and after a lengthy siege was laid waste (1161). Later, united in one league, called the League of Lombardy, against their foreign ruler, they built a new city, which they named Alessandria, after their staunch ally Pope Alexander III., whom Frederick had driven from Rome in 1167. Alessandria withstood a siege during 1174-75, nad criven from Rome in 1167. Aleasandria withstood a siege during 1174-75, and in 1176 the allied forces inflicted a crushing defeat upon Frederick at the battle of Legnano. In 1177 the emperor made terms with the pope for a six years' truce, and in 1183 a permanent peace was retided but the treate of Countering. ratified by the treaty of Constance, which granted to the Lombard tos. the right of war and self-gov. During the short reign of Frederick's successor, Henry VI., the strife between Guelphs and Chibellines broke out in I. In Germany it had stood for a quarrel between two rival dynasties, for a quarrel between two rival dynasties, but in I. the Guelphs represented the papal party, i.e. Rome and the League of Lombardy, while the Ghibellines stood for the imperial party. On Frederick's death (1190), Henry laid claim to the whole of I. and the two Sicilies, his claim being acknowledged in 1191. During his son Frederick II. slong minority, the power of the pope extended as far as ('onstantinopie at the time of the fourth Crusade (1198–1204). The spoils of war vero shored with 1204). The spoils of war were shared with Venice, who had volunteered her fleet for the transport of men. Thus Venice be-came estab, as one of the most powerful commercial cities of the Mediterranean. In 1220 Frederick II, was crowned king and emperor, the virtual ruler of Germany, and emperor, the virtual rilier of Germany, I., the Suelies, and Jerusalem. He made a determined effort to clush the league and subdue the pope, but, the power pitted against him were too strong. Pope Gregory IX. excommunicated him in 1227, and Innocent IV. declared him dethroned at the council of Lyons in 1215. The Swabien line ended in 1266 and in 1273 Rudolph of Hausburg was grouped entertained. Rudoib of Hajsburg was crowned empers by the pope, and five years later and a public recognition of the pape's temporal sovereignty in the papal states. The Guelph party was now supreme in the N., but lost much of their influence in the S. when Sicily robelled against Charles of

abandoned his authority over papal | Anjou and placed itself under Aragonese trile (1282). At the end of the century the Guelphs of Florence were divided into two factions—the Neri and the Bianci. In 1300 Boniface VIII. called in Charles of Valois, who banished the latter faction and then undertook to manage the affairs of the republic. In 1309, the pope, Clement V., being a Frenchman, the seat of the papacy was transferred to Avignon, where it remained till 1377.

The period of nearly seventy years was marked by great commercial prosperity. The N. tns. still made war upon one another, but the burghers paid companies of adventurers, condotters, to do the fighting. The rural counts lost their power and became citizens of the tns., and the office of podesta was now practically that of a judge. In many tas, his place was taken by a new functionary, the captain of the people, who was a leader of Guelphs or Ghibellines, whichever party was in the ascendant, and whose powers, being ill-defined, tended to become unlimited. In the N, the popes lost their prostige as It. potentates by the removal of the Holy See to Avignon. Rome nominally obeyed her bishops, but the temper of the times was shown in the brief republic (1347-54) set up in the city by Rienzi on semi-classical, semi-feudal lines. The duchy of Milan was governed by the powerful Visconti dynasty till 1447. Under the powerful prelate Gian Visconti (d. 1351) the duchy conquered Genoa and a large portion of N. I. But in 1450 Filippo's son-in-law and general, Francesco Sforza, seized the Visconti's possessions with the and of his Florentine ally, Cosmo de' Medici, and proved himself to be a wise and liberal-minded ruler. Until 1343 Florence had been subject to an adventurous foreigner, Walter of Brienne, Duke of Athens. For the following hundred of Athens. For the following hundred years, with the exception of a short-lived revolution of artisans, the city was governed by an oligarchy headed by the Albizzi family. During this period Flor-ence achieved the subjection of Pisa and extended her domains in Tuscany. But the oligarchy was opposed to the wealthy and democratic family of Medici. In 1434 Cosimo de' Medici estab, a republic of which he assumed the presidency. He strengthened his position by making the adlance with Francesco Sforza mentioned above. The presidency maintained by Cosmo became a dictatorship under his randson, Lorenzo the Magnificent. The hist. of Venice was very different from that of the other great it, states. In the cleventh century the administration lay in the hands of the popular representative, the dogo. After a series of revolutions, however, the oligarchical principle was estab., and in 1311 the Council of Ten was formed. In the middle of the fourteenth century she began her struggle for mari-time supromacy, which ended in victory (1381). In 1406 Venice added Verona,

an It. prince, but the individual enjoyed | Modena and Genoa were placed under the liberty, and every encouragement was given to literature and art.

Peace lasted till 1991, when a new age opened for 1. Throughout the following century the country was a battlefield on which France and Spain fought out their quarrels and strove for new conquests. In 1494 Charles VIII. of France invaded In 1493 Charles VIII. of France invaled in Males I. at the request of Lodovico Sforza, who was auxious to become Duke of Milan. Charles, after having the Medici expelled from Florence, marched S. and was crowned in Naples In the meantime crowned in Naples In the meantime Lodovice assassinated his nephew, Gian Galcazzo, and rused Lombardy against Galeazzo, and rused Lomburgy against Charles, who with difficulty made good his retreat to France. The was was now opened to other invaders. In 199 Louis XII., the successor of Charles, subdued Milan, and in 1994 mytted the Emperor Maximilan to assist him in the conquest of Venice. In the confusion the papacy made a most determined and successful made a most determined and successful defonce against the foreigness. In 1508 was formed the League of Cambrai with France, Spiin, and Germany against Venice. But in 1512 the army under Gaston de Feix fought a fierce battle against the combine 1° p. Venetian, and papal troops on the banks of the Ronco about 2 m. from Ravenna. The Fr. were detective but Center all In the color about z m. from flavenia. The Fr. were victorious but Gaston fell in the act of pursuing the enemy. The Fr. returned in a few years. In 1515, their new king, Francis 1, was victorious at the battle of Marignano, and entered Milan, but in 1511. 1524 was expelled by the troops of Emperor Charles V. These devastating wars ended in the peace of Cambrai (1529), by which Charles V. was left in possession of I. In 1537 the Fr. took possession of the ters, of the dukes of Savoy, but these were coded to Philip, the son of Charles V., by the treaty of Cateau-Cambresis (1559). Venice, Genoa, Lucca, and San Marino were allowed to retain their independence

Until the end of the eighteenth century it may be said that I. now ceased to have a hist, of her own. Wars in which she had no interest, but was the patient sufferer, continued to be fought on her soil. Venice regained some of her lost power by the conquest of the Peloponnesus (1681), but conquest of the Petoponnesus (1981), but this was recaptured by the Turks in 1715. Piedmont was ceded by Spain to Em-manuel Pilibert, who regained Savoy and Mioc. The War of the Sp. Succession (1701-13) led to a redistribution of It. By the treaty of Utrecht (1713) and. By the treaty of Otrecht (1713)
Austria succeeded to the Sp. dominions,
and Sicily was given to Victor Amadeus,
duke of Savoy, with the title of king. In
1720 be had to yield that is, to Austria in
exchange for the kingdom of Sardinia. was subjected to a further redivision at the end of the War of the Austrian Suc-cession. By the treaty of Aix-la-Chapelle the end of the war in the constitution of Alx-la-Chapelle (1748). Milan, which had been captured by Austrians in 1714, was ceded with Tuscany to the House of Austria; the Bourbon, Charles III., was confirmed in his kingdom of the two Sicilies; his brother, Don Philip, was given the duchy of Parma; Piedmont and Sardinla remained in the bands of the House of Savoy; and hands of the House of Savoy; and and a republic was set up with himself

protection of France, to whom the Genoese surrendered Corsica in 1755.

For forty-four years I. enjoyed peace. Tuccany was ruled by lieutonants until the death of Francis I. in 1765, when his second son, Peter Leopold, afterwards Emperor Leopold II. (1790), was made grand duke. His rule was characterised by its agric, improvements, suppression of the Incustition, and whee reforms. He of the Inquisition, and wise reforms. He performed a lasting benefit to his subjects by draining the Val di Chiana. The rule of Mana Theresa in Lombardy was also

or Maria Theresa in Lombardy was also remembered as a period of internal peace. The chief event after the treaty of Aix-lin-Chapelle was the invasion of I. by the Fr. Republican armies in 1796. In the following year the Emperor, Francis II. was brored to sign the treaty of Campo Formio, by which Venice and the ters. N. of the Adam were given to America and of the Adige were given to Austria, and the rest of N. and Central I. was divided up into republies, such as the Cisalpine, Therine, Ligurian, Cispadane, and Par-thenopoun republics. The great cities were filled with a wild hope of liberty, but the soon discovered that their freedom was but nominal under the presidency of Nanolcon Bonaparto. In 1799 the Rus-suar troops gamed a victory at Trobia, and in 1800 Napoleon crossed the Alps and confirmed his previous victories at the battle of Marengo. The Claspine re-public was declared the Italian republic in 1802, and Napoleon was crowned King of at Milan in 1805, and in the follow-ing year he made his brother Joseph king of Naples. But at the overthrow of Napoleon in Paris (1814) the kingdom of I. crumbled to pieces, and at the Congress of Vienna (1815) the allies redistributed the country among themselves, but the pope was left in possession of the Papal States. The result of the Napoleonic invasion of

I was that the rule of the petty princes was more oppressive than ever, but national pride had been aroused and had given birth to a great hope for the future unity and self-gov, of the whole country. See ret societies, the most important of which was the Carbonari, flourished among the educated classes; risings broke out in the S. (1820); and in 1831 the flery young the S. (1820); and in 1831 the nery young patriot, Giuseppe Mazzini, organised a political society called Giovane Italia (Young Italy) for the emancipation of his country. Mazzini came to London, from which, by means of literature, he actively propagated his republican theories among his countrymen. The more moderate Liberals, as is shown in the writings of Leopardi and Foscolo, despaired of the future of I. In 1848, the year of revolu-tions, insurrections broke out in Lombardy, but the Austrians won the battle of Custozza, and placed the country under martial law. Popo Pius IX., who since 1846 had passed certain measures of re-form, was torn between his desire to support it, freedom and his foar of making war on Catholio Austria. His authority, in consequence, weakened daily; he was declared traitor, and fied in disguise to Gaeta. Mazzini hurried back to Rome,

and two others as triumvirs. In 1819 Charles Albert received a crushing defeat from the Austrians under Radetzly, and trom the Austrians under Radetzky, and abdicated at Novara, leaving his son. Victor Emmanuel II, to make the terms of treaty. Lombardy reverted to Austria, and a part of the Fiedmont. oe ter was also ceded. In the same year Leopold and Ferdinand, who had joined the pope at Gaeta, returned to take up the reins of gov. France decided to restore Rome to the pope and sent Gen Oudinot to beslege the city. He was defeated at Cruta.

against Francis II., the son of Ferdinand, and was assisted by Garibaldi, who won victories at Calatifimi and Melazzo Assuming the title of dictator, he entered Naples in Sept. 1960, krancis having fied. The united troops of Garibaldi and Cavour different the Paral Statest Cortains. defeated the Papal States at Castelfidardo. and the Neapolitans at the Volturno. and berdinand, who had joined the pope is lify and Naples were americal to Sarat Gaeta, returned to take up the reins of dinia in Oct., and (aribaldi hailed Victor gov. France decided to restore Rome to the pope and sent Gen Oudinot to besiege at the assembly of the first It parliament the city. He was defeated at Civita in Turin, Victor Emmanuel was decreed Vecchia by Garibaldi recently returned king of I, and Garibaldi resigned from his

from exile in S. America The Neapolitans, augmented by 5p soldiers marched northwards, and were also defeated by Gartbaldi at Palestrina and Velletri, but The Neapolin spite of these successes the Fr troops succeeded in entering Rome, and the pope

returned in 1850 At this time almost of despair, Cavour came into prominence as the champion of the national movement In 1852 Victor Emmanuel appointed him prime minister The Gouta Nationale was formed, with the moto 'Unity, Independence and Victor Limmanuel.' The king and Cavour secretly encouraged the movement, though secretive encouraged the movement, though their only avowed aim was to expet the foreigner. In 1858 Cavour intered upon negotiations with Napoleon III which resulted in the outbreak of a Franco Austrian war (1859). In the same year the Austrians were defeated at Montebello,

dictatorship. In this same year Cavour died. Rome was still held by the pope and the Austrians were in possession of Venice. In 1862 Garibaldi raised troops to liberate Rome, but was defeated at Aspromonte, and Rom Catholic opinion throughout I urope was opposed to the annexation of Rum to the new kingdom fit troops had held that city since 1849 By the runco Italian Convention of 1864, the It agreed to ever unto Rome within the years on condition that the Papal States were recognised and the cap of I moved from Turn to Florence In 1 In 1867, in spite of the agreement of 1884, Gari-baldi made sev attacks on Rome and consequently Louis Napoleon sent back his troops, who deteated the Garibaldians negotiations with Napoleon III which resulted in the outbreak of a Franco-Austrian war (1859) In the same year the Austrians were defeated at Montebello. Prussian war, the It army under Gen. Cadorna, after a brief resistance entered wisional govs. were estab in Florence and Modena; and an insurrection broke out in the Papal States. S. Italy rebelled Plus IX., refused to abandon his temporal

difficult, owing to the great social differ-ences between N. and S. In 1878 Victor Emmanuel died and was succeeded by Humbert I. (b. 1841); Pins IX. being succeeded by Leo XIII. in the same year. Humbert's reign was characterised by electoral reform (1881) and foreign colonisation. Somaliland, along the N.E. coast of Africa, was acquired between 1880 and 1890, and the dependency of Eritrea was founded in 1882. I's claims to a protecfounded in 1882. I's claims to a protectorate over Abyssion led to war, which ended in an It. defeat at Adowa (1896), and the restoration of all land to Abyssiola by the treaty of Addis Ababa (1896). In 1883 I. joined Germany and Austria, forming the Triple Alliance, largely owing to her distrust of France. In 1900 King Humbert was assassinated by an anarchist, and was succeeded by his only son. Victor Emmanuel 111. At the beginning of the new century I. entered upon more friendly relations with France, the Triple Alliance being still maintained. In the dissensions in Marca. 1906-11 she gave her support to France against Germany her support to France against Germany while France acquiesced in It. ambitions in Tripoli. In sept. 1911 war broke out between I. and Turkey in connection with the rights and privileges of it, subjects in Tripoli. In Nov. of the same year the it. gov, formally proclaimed the annexation of Tripoli and Cyrenaics, which was rati-fied by Turkey in the treaty of Onely in Oct. 1912. The Ottoman Empire had hastoned to conclude peace with I, as Turkish supremacy was threatened in the Balkans by the Balkan Aliance. The triumph of the allies in the Balkan Wars (q.r.) was a setback to Austro-Ger. policy, which favoured Turkey, but despite I.'s sympathy for the Balkan allies, I. was again drawn into the Triple Alliance with Germany and Austria for a further period, renewed on Dec. 7, 1912. Austria, how-ever, disregarded the terms of her treaty with L in pursuing her Balkan policy of agression against Serbia. L was unable to intervene, being occupied in 1914 with a revolutionary movement which expressed itself in strikes and rioting. These difficulties were encountered by Salandra, who became premier in March 1914 on the resignation of (Hollitti (q.c.), who had been a virtual dictator for eleven years. After the declaration of war between the En-bents and the Central Powers. I. main-tained her neutrality, deening herself not bound by the Triple Aliance, the ferms of which Austria had broken by her sole action against Serbia. As the price of continued neutrality, I. demanded con-cessions from Austria in the Trentine, Istria, Dalmatia, and Albania. Although tained her neutrality, decruing herself not bound by the Triple Alikanes, the terms of which Austria had broken by her sole action against Serbia. As the price of continued neutrality, I. demanded concessions from Austria in the Trantine, Istria, Dalmatia, and Albania. Although Germany favoured these claims. Austria rejected all but a small extension of the Grand Lordier. Baron Somnine, It. Foreign Athinster, then opened negotiations with the Entonte, and finally on April 26, 1915, the treaty of London was signed, by which the treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed, by which the final treaty of London was signed. · Istria, Dalmatia, and Albania.

sovereignty, and withdrow as a voluntary promised together with an immediate loan prisoner to his own domains, which were allowed the privilege of exterritoriality.

The consolidation of 1., since the formation of the kingdom, has been slow and properly equipped, while for the main offensions of the control of the contr poorly equipped, while for the main offen-sive launched on the Isonzo and for the operations in the Isonzo and for the opera-tions in the Trentino only some 100,000 men were available. (See Isonzo; ITALIAN FRONT, FIRST WORLD WAR CAM-PARIAN ON; WAR, FIRST WORLD.) Not until 1916 did I. become actively at war with Germany. As a result of Sonnino's foreign policy the unity and independence of Albana were proclaimed under the perof Albania were proclaimed under the pro-tection of I., while in April 1917 the Treaty of St. Juan-de-Maurienne was concluded with France and England, delimiting 1.'s share in the partition of Asia Minor. The treaty was confirmed at an Allied Confertreaty was confirmed at an Ained Conference held in London in Aug., and, following discussions there, an offensive was started on the It. front which resulted in the disaster of Capocatto (q.v.) in Oct. This defeat stiffened It. resistance and in June, 1918 the reorganised It. army defeated the Austrians at the battle of the Phinte and w. Oct. Austria small versus Piave, and in Oct. Austria sued for an armistics. At the end of the struggle the resurces of I. were exhausted, her losses in more amounted to half a million, and her great effort had reduced the country to a worse state than that of her allies. The fact, however, that for I, the war ended with a military victory encouraged a Nationalist movement, opposed to more moderate opinion in favour of an entente however I, and the succession states. The Astonalists demanded Flume as well as the territorial gains promised in the treaty of London. (See Flume.) The Addintic problem (see Admarte Question) was unsolved and It. disatisfaction with the Peace Treaty caused the resignation of the Peace Treaty caused the resignation of Orlando, who was succeeded by Nitt. Domestic unrest in I. was heightened by the feeling aroused over the Allied intervention in Fiume, following the comp d'ent of D'Annunzio (q.r.), who on "ept. 1919, occupied the city. The Adriatic Question was settled tentatively by the treaty of Rapallo (q.r.), whereby I. surrendered the Dalmatian coast but secured accordingly over Varse (ar.), this februar sovereignty over Zara (q.r.), thile Flume was made an independent state. It rewas made an independent state. It re-mained for Mussolini to reach a definitive settlement, known as the treaty of Rome, Jan. 1924, whereby Yugoslavia exercised control over Port Barce and the Delta and I over Finne. There also followed the hetune Commercial Agreements, but these were not rathed by the Yugo-Slav gov. until 1928.

Nationalists. A conflict with the gov. of various treaties and conventions became inevitable. In a speech on Sept. guaranteeing the integrity of Abyssinia, 29, Mussolini proclaimed his allegiance to hiussolini announced his intention of anthe idea of monarchy, and the Fascist march on Rome was organised. The Fascist columns reached Rome on Oct. 30, the same day as Mussolini arrived from Milan in re-ponse to a royal summons. He at once formed a cabinet in which he combined the premiership with the Ministeries of foreign affairs and the interior. Gen. Diaz became minister of war and Adm. Thaon di Reval of marine. At the elections held in April 1924 the Fasci ts gained a majority of 1,758,521 out of a total of some 74 million votes. Mussoliul retained the form of parl gov., and there was, at first, an organised Opposition which hoped to oust Mussoliul on the strength of the anti-fuscist feeling aroused by the murder of the Socialist, Matteoiti. Mussolini remained proof against the Opposition, which combined rigid constitutionalists with anarchic antimonarchists. In Rom. fashion the Opposition 'withdrew on to the Aventine,' atton withdrew on to the Aventine, but this gesture was unavailing. There re-mained only the opposition of the three former premiers—Orlando who retired from active politics; Salandra, who was elevated to the Senate; and Giolitti, who died in July 192%. In domestic affairs the Fascist Gov, set the country to work, re-serts the sight-hour day and develved. setab the eight-hour day, and developed the policy of organising labour into syndicates, which were a species of trades unions, including both employers and workers, and under state supervision.

In toreign attairs, I, successfully encountered many difficulties—with Yugo-Slavia over Flume (see above); with Greece over the nurder of Gen. Tellind of the Albanian Frontier Commission, followed by the It. occupation of Corfu; France over the treatment of It. minorities in France and Tunisia, with Turkey over Turkish fears of an It. annexation of Anatolia. These problems were eventansona. These problems were eventually solved and concluded by a series of pacts—that with Greece on Sept. 23, 1928, with France on Dec. 3, 1927, and with Turkey June 1, 1928, while an Italo Albanian alliance was concluded on Nov. 22, 1927, and a commercial treaty with Soviet Russia had been in existence since Feb. 1924. I. was also a signatory to the Locarno Treatics (q.r.).

Locarno Treatics (q.r.). A rapid increase in pop., coupled with a dearth of raw materials, led I. along the road of imperialism. Fascist policy tended to even greater aggressiveness, notably in rivalry with France, both in naval construction and in agitation for the revi-ion of the Versailles Treaty. But partly owing to France's then dominating position in Europe and Mussolin's dispute with the Vatican over jurisdiction in the position in Europe and Mussolini's dispute with the Vatican over jurisdiction in the educational sphere, the dictator was obliged to pidy the rôle of protagonist in the movement for a limitation of armaments and European security. But five years have the dispute of a new wards Ethiopin sowed the seeds of a new European conflagration, besides menacing the whole existence of the League of Nations. Notwithstanding the existence

conventions nexing the country and, by May, 1936, the nexing the country and, by May, 1936, the It. forces were in occupation of the Abyssinian cap. (see ITALO-ABYSSINIAN WAR, 1935-36). Thus, in addition to the great ters. conquered in 1911, vast new regions were added in 1936; yet the number of Its. settled in E. Africa scarcely ever exceeded 30,000. The League of Nations considered collective action against 1., but the idea was eventually abandoned. As a consequence the various European nations agreed to recognise ious European nations agreed to recognise officially the It. conquest of Abyssinia, and in 1938 as a prerequisite to recognition Great Britain entered into an agreement with I., designed to prevent It. aspiration m Africa and It. support of Gen. Franco in the Sp. Civil war (q,r.) from becoming a the specific war (4,7) from between the two countries. The agreement was not, however, put into effect until after the Munich Part when Mussolini's prestige order of the part in the settlement (see EUROPE—History during the second World War). This event strengthened the ties between I. and Germany even though the Ger. annexation of Austria earlier in 1938 had appeared to frustrate Mussolini's ambition of achieving a dominant position in S.E. Europe. acquiescence in the annexation nullified the Franco-it., Pact of 1935 which was designed not only to regulate relations in Africa but also to preserve the independence of Austria. Later in the year (1938) the pact was formally denounced as a hos-tile gesture towards France whilst It. claims were launched for Dilbouti, Tunis, Corsica, and Nice. Mussolini's aggressive intentions became more manifest while at home his autocratic position was strong-thened by the abolition of the Chamber of Deputies. In its place a Chamber of Fasci and Corporations was set up, having 800 members from the National Council on hembers from the National Council of the Fascist Party and the National Council of Corporations, nominated by Mussolini. The gov. had the right to promulgate decrees with the force of law, which were then placed before the chamber. The chamber dealt with constituber. The chamber dealt with constitutional laws, budget estimates and also
any matters previously authorised by
Mussolini to be so dealt with. The real
uling authority was the Gran (Council),
which was composed of the quadrumviri
of the March to Rome, uppointed for an
indefinite period, a certain number of
members (unhisters and other high digmatries) appointed for as long as they
acid their offices, and an indeterminate
number of members appointed for three
years by the head of the gov.

On April 7, 1939, It. troops invaded
Albania. King Zog fied, and the country
was occupied, King Victor Emmanuel III,
becoming also king of Albania. At the

action S of the Carpathians The attempt to set up I as a Balkan protagonist was part of the policy of non bolliger ency which Mussolini adopted on the outbreak of the Second World War in 1949. He was accordingly thanked publicly by Hitler for his diplomatic and political support and released from military obligations. Nevertheless, the following year with the decline of allied fortunes in the W. Mussolini became convinced of Ger The at-W, Mussolini became convinced of Germany system; and on June 10 I declared war on France and Great Biltim This action was preceded by the breaking off

Germany, however, succeeded in retrieving It fortunes in both \ Africa and the Balkans and the reflected prestige helped to muntain the Cascist regime in I which fell more and more under the control of Gumnny

Mussolini's son-in-law, who had been Foreign Minister since 1936, was appointed who had been to the lesser post of ambas, to the Vatican. Dissension within the Fascist Vatioan. Dissension within the Fascist Party, however, broke into open revolt when Mussolini, after two meetings with Hitler in July, was unable to obtain a promise of adequate Ger, support against the coming invasion. By order of the king Mussolini was arrested, and Marshal Badoglio was called upon to form a gov. He at once put out peace feelers while at the same time publicly proclaiming the continuation of the war. A secret armistice was agreed while the Gers., in anticipalion of some such move, tightened thee was agreed while the ders. In anti-cipation of some such more, tightened their grip in N. I. and also occupled the Rome airdelds. On Sept. 8 following the Allied landing at Salerno the airustice was declared. Badogho set up his gov. was declared. Badoglo set up his gov. in Bit. occupied ter, and on Oct. 11 L. declared war on Germany. The king was likewise maintained by allied authority. In the N., on the other band, Mussolini having been rescued from allied hands by Hitler's emissance attempted to set up a republican Fascist regime. He revenged himself on those of his former supporters who had betrayed him but were now in who had betrayed him but were now in his power. Among them were Count tiano and Marshal de Bono who were tried and shot.

In S. I. there was a movement against the monarchy headed by the Liberal leader Count Torza and the aged philo-opher Benedetto Croce, and this found sopher Benedetto Croce, and this found expression at a meeting of the Council of National Liberation held at Bari in Jan. 1944. The king promised to retire as soon as the Cct. occupation of Rome was ended. In April Badoglio tornied a new gov. to include Count Stora, Croce, and the Communist leader, Signor Togliatti. In Jane the allied armies entered Rome words a popular velcour, and on June the control of the country of th amid a popular welcome, and on June 5 King Victor Emmanuel retired in favour of his son, Prince Umberto. He did not, of his son, France Cimerto. He did not, however, abdicate. Badoglio resigned, and Signor Bononn (q :) an elder states man from the days before I users m, formed a new goy. With an It. Gov. in Rome most of the occupied areas of S. I. were handed over to It. control, and the gov. was recognised diplomatically by the

United Nations. On April 27, On April 27, 1915, Mussolini with twelve of his cabinet was shot by members twelve of his cabinet was shot by members of the Partisan Movement which was resisting the Fascists in N. I. A few days later, May 2, the Ger. army in I. surrended, and the liberation of I. was completed (see ITALIAN ERONT, SECOND WORLD WAR CAWFAIGNS ON). Bonomi, who considered his interim task now at an end, resigned, and was succeeded by Signor Parri, a leader of the Partisans, who formed a coalition gov. with the Socialist leader, Napari, and the Liberal leader, Brosio, as vice-premier; while Togilatti teader, Neani, and the Liberal leader, Broslo, as vice-premiers while Togliatti became minister of Justice. A consultative assembly was set up, and local elections were held at the end of the year. Parri resigned in-Nov., and a new gov. combining six parties was formed by de Gaspert. By this time the Allied Military Core. But have deep was to the It (for the elections were held at the end of the year.

Parri resigned in Nov., and a new gov.

combining six parties was formed by de gasper. By this time the Aliled Mitiary is appeal for revision was, however, made Gov. had handed over to the It. Gov. the to the United Nations. The gov. alliance

control of all ter. except Venezia Giulia. and the Udine prov., while the economic situation was eased by supplies which reached I. from foreign sources through

U.N.R.R.A On May 9, 1946, King Victor Em-manuel formally abdicated, a move which may have been designed to breathe new life into the monarchy. In spite of the fact that it had been decided to hold a fact that it had been decided to hold a nation-wide referendum on the subject of the monarchy in June, Prince Umberto, who had been acting as Lieutenant-General of the realin, was crowned king as Umberto II A referendum was, however, held, and the result was a vote of 12,715,000 tor a republic against 10,719,000 for the continuation of the monarchy. King Umberto at first disputed the deci ion, but on June 13 he left Rome On June 18 the Court of Cassation upheld the result of the referendum, thus bringing to an end the reign of the thus bringing to an end the reign of the House of Savov.

Elections were held for the Constituent Assembly which resulted in a gain of 207 seats for the Christian Democratic Party, 115 for the Socialists, and 101 for the Communists out of a total of 556. The Constituent Assembly met on June 25 and proclaimed a republic, electing En-rico de Nicola as President. De Gasperi continued as premier of a reconstructed coalition gov., the first for twenty-five veus to consist of deputies fixedy elected, Eight members of the gov belonged to the Christian Dinocratic Party, four were socialists, four Communists, two Republican and concluded the control of the control o

hean, and one Liberal

The first event which confronted the new republican goy was the Peace Treaty with the Allies, the draft of which was pub on June 30, 1946, as drawn up in Pans by the Council of Foreign Ministers, ippresenting Great Britan, U.S.A., France, and Russia. The treaty was signed on Feb. 10 the following year, but the It. gov. at the time of signing registered a protest at the terms of the treaty while affirming they would be loyally met. The treaty was an occasion of national rourning, and the terms whereby Estria, Frame, and ter. E. of the Isonzo were coded to Yugoslavia (with the exception of the newly created Free Ter. of Trieste) were considered a sad blow to I. while they did not satisfy Yugoslav ambitions. the anong other conditions were that the Tenda-Briga area in the Maritime Alps was creded to France, and the Dodecanese Is, to Greece while I. also lost her colonies in Africa and agreed to respect the independence of Ethiopia. I. agned to pay reparations over seven years, amounting to 100 million dollars to US S.R., 125 million to Yugoslavia, 165 million to Greere, 25 million to Ethiopia, and 5 million to Albania. Provisions were also made for the demilitarisation of frontiers and of is. to the Mediterranean, and for the limitation of armed forces. and for the limitation of armed forces.

between the Catholics (Christian Democratic Party) and the Communists reflected the uneasy state of equilibrium main-tained in the country two years after the end of the war Shortage of raw materials and other economic difficulties were addi-

tional causes of unrest

The withdrawal of left wing support overthrow the coalition gov in May, but the following month de Gaspers formed a the following month de caspers formed a further got dependent mainly on the Christian Democrats. The Constituent Assembly, due to discolve on June 24 prolonged its own life until the end of the year, thus automatically postponing further elections, and it was in conditions of considerable political uncertainty that the Assembly addressed itself to its prime teal of tangents constitution. station above While the communists still held a place in the gov they tried for purposes of their own, to introduce members of their inovenient into the cuvred out of the gov, largely by Do Gaspers, the communist element in the State's service has been fairly thoroughly weeded out. But at least nine out of every ten ervil pervants who lost their jobs because a their of tions with fa-cism were reinstated. They were never expurgated in the strict sense of the term. because there was no hard and fast rule Roughly, a distinction was drawn at the time between these civil servants who followed Musselm into \ Italy are a the liberation of Rome and those who staved behind, but it was a distinction which could not be maintained for ever The undoubted undertone of fascist sympathy, however, that prevailed in I was still sentimental rather than political and the small aggressive political party of the neo fascists, known as the Social Movement made only slow progress All other ment made only slow progress. All other right wing political groups were virtually eclipsed by the result of the cluctions of April (1918), when the Christian Demo-crate were given an overwhelming man date. The Christian Democrats are not in the abstract, right wing though in the context of present day it politics they wore inecapably on the light as cham plons of the church and the property owner against the community. The party officially demonstrated its central position by allying steelf with the liber is on the right hand and with the republicans and independent socialists on the left. The communist opposition used the trade umon movement as its pun weapon against the gov and since the mail anti-Westpon communist minority in the movement

Austria Austria In the result Grüber, the Austrian foreign minister and De Gasperi, Austrian foreign minister and De Caspert, the It Prime Minister, staned an agree ment between themselves, at Puns, Cutiber asknowledging the Breuner fron tat. In Caspert, in return, promising local self gov or autonomy within the frame work of the It Statt for the prov of Bol zano and the few mixed language coms in the S prov of Trento This agreement we highly unpopulu in both I and Austria both the deput rates. An tria, both the signatories being actued of signing away a national birth right Under the statute eventually dutted the new autonomous region was ti i ic to include Boly mo and the whole of th It speaking prov of Trento Under its shome the Its tell that, though the car peaking elements would get a m juit, in Bolzano prov, they had en strict a safe it spealing in agority in the elected regional council. But both sides had reckened without those inhab of Tirinto who, although they speak it, are publically in sympathy with the Pyrolese princially in sympathy with the Fyrol se and those influenced the result of the election (Nov 28, 1948) which gave the Vols-partiel, or party of the Ger-speaking tople of Bolzano, and the Christian Department of Bolzano, and the Christian Department of the country of the coun

is a tester tongue of Fi. 52. Portraguese Run annan, and Provençal It is naturally more closely connected than any of these with lat, the language of the Roms the uninonce of the written speech of Virgil Cicero, and Horace linguring for long in the peninsula. It grammar is a simplification of Lat grammar, but the popular spoken Lat of the rustic played a very important part in the evolution of the It vocabulary. It is divided into the It vocabulary It is divided into very many dialects and the pronunciation or smiller words differs very greatly throughout the country. The standard literary and political presh is the Tuscan lider which came more prominate during the lourteenth century when it was my the four-openin century when it was compassed by Dante and his contemporal of the sum in me ana ingua itat a (51 84), 1888 1 12, 6 I Ascoli, to how giolologoo i di mo, 1873 et seg. communist minority in the movement recorded in 1949, to form its own so called for rounion was almost entirely in the hards of the communists

I. has about 200,000 inhab who have no love for I. Those are the Ger spenking people who live in the northernmost prov of Bolzano, bordering on Switerfland and Austria Petitions demanding a severance of the ties with I were sont to the Parks conference of 1946. Some of the petitioners hoped for an independent Tyrolean State, others called for rounion with

of love and war throughout the peninsula. In the early thirteenth century there grew up round the court of Frederick II. (1194– 1250) in Sicily an It. school of poets who 1250) in Sicily an it. school of poets who closely initiated the Provenceal lyrice both in style and matter. Chief among them were Frederick himself, and his sen Enric (d. 1272). Piero delle Vigne (d. 1219), and Giacomo da Leutini. But their art was wholly imitative, conventional artificial, and consequently short lived. In the latter part of the thuteenth century the Tuscan tongue came into prominence. Puscany had this advantage over the rest that its lingua rolgare, the familiar speech that its lingua volgare, the familiar speech of the rustic, was more generally polished to as to resemble the poetic diction of other dialects. The Siculo-Provençal poetry was imitated by a small Tuscan school, which, with Guittone d'Arrzo (1215-91) at its head, included the humorists and satirists Folgore of San Gimignano, Cene della Chitarra, and Rustico di Fillipo. Guittone abandoned the Provençal chivalric forms, and wrete political and didectic poems. His great political and didactic poems. His great pupil, Guido Guinicelli (d. 1276), wrote philosophical lyrics, which are intellectual rather than imaginative, but mark a great development in the hist, of It, poetry. A contemporary of his was Brunetto Latini (d. 1294), the friend and master of Danto His Tesoretto was obviously influenced by the allegorical poems, such as Le Roman de la Rose. Under the same influence was de la Rose. Under the same influenco Francesco de Barberiuo (1264-1348). Umbria the development of poetry was largely due to the religious movement brought about by the estab. of the Fran ciscan and Dominican orders. To St. Francis of Assisi (1182-1226) has been attributed the Cunico del Sole, a hymneritten in rhythmical pross. The great written in rhythmical prose. The great est exponents of religious poetry at this time were Jacope dei Benedetti da Todi and Raniero Fasani Fasani's Laudi and similar liturgical compositions are the earliest form of It. religious drama. The carliest specimen of it prose dates from the middle of the thirteenth century. The Cento Novelle Anticho vas probably written by a Florentine. It is a collection of short tales drawn from Onental, Gk., Trojan, and medioval sources. Francesco Barberino included similar stories in his Del Regamento e dei costumi delle donne. The letters of Fra Guittone d'Arczzo, on moral and religious subjects, are interest-ing specimens of the lingua relgare. In addition we have a number of trans. and adaptations of Fr. romances and Lat historical ascetic treatures an original scientific work on astronomy and goography called Compositione dil mondo, by Ristoro d'Arozzo; and treatises on government. De regimine principum, by Egidio Colonna who wrote in the Vonetian dialect.

The lourteenth century, called Trecento. Is the age of a inlightly tilo-Dante. Petrar b, and Boccacelo. Hitherto, poets and writers had experimented in various dialects, and Tuscan had been proved to surpass the others. The great writers of the fourteenth century were all Tuscans, and by their use of it made the

Tuscan dialect the acknowledged literary medium of speech in I. for all time, Dante's immediate predecessors in lyric poetry were Guido Cavalcanti, whose Sulla natura d'amore is a poem on the metaphysics of love, Cino da Pistoja, and Lapo Gianni. To this school belonged Dante Alighieri himself (1265-1321). Mis work culminated in the Divina Communa, a transcendental poem of incomparable beauty tere DANTE). Francesco Datance (1301-71) you at the time re-Tuscan dialect the acknowledged literary parable beauty (see DANTE). Francesco Petraica (1304-71) was at the time regarded as the dictator of literature, and his love for Laura has remained as an inspiration to all succeeding pucts of every nationality (see Pitrahen). But he must be studied not only as the writer of beautiful love-lyrics, but also as the first humanist in L. the foreruner of the revival distinguished by an enthusiastic study of anct. classic literature. Giovanni Boccaccio (1313-75) had the same zeal for re-carch into the works of antiquity, as is testified by his encyclopædic works in Lat. on diverse subjects—De genealogia deorum, De casibus virorum illustrium, De claris multeribus, etc. His narrative poems, Testid, Filostrato, and Ninfale flesolamo, are far moro successful than his lyrics, while his .Imorosa Fisione shows the influence of Daute. His fame rests mainly on the Decamerone, a collection of a hundred notelles, which are arranged and told with the skill of an artist who is at the same time an observant and sympathetic man of the world (see Boccaccio).

These three great writers had many mitators Among Dante's followers must be numbered Francesco Stabile, called Cecco d'Ascoll (1269-1327; L'Acerba), Fazio degli Uberti (Dillamando), Federigo Frezi (Quadrfregio), whose works are chiefly of historical interest to the student Novel writing had already attained great popularity in France and other countries. The example set by Boccaccio was now closely followed by Giovanni Fiorentino (Preceme, 1378), Franco Sacchetti (d. 199), a moral writer on immoral subjects, and Giovanni Lorcambi of Lucca (1347-1421). The prose literature of the time is chiefly represented by the tales and novels of these and other men, and chronicle is very important as being the first attempt at historical writing. The greatsthistorian of the time was undoubtedly Giovanni Villani, who wrote a chronicle of bis native city, Florence, including a review of the world's hist. From the Tower of Babel down to 1348. Travel literature is represented by the traces of Marco Polo, and the religious and mystic sentiment of the time is expressed in the letters of St. Catherine of Siona (1347-80) and in the Fronti, a collection of the words and deeds of St. Francis, During the period succeeding the death of Dante, Petrarch, and Boccaccio, there was a dearth of great writers. This may be accounted for partity by the over estimation of anct. Gk. and Lat. writers and the consequent under estimation of works in the vulgar tongue. Among those who ventured still to write in it, rather than in Lat. must be numbered Leon Battista Alberti (1407-72), with his Della Familia. and Matteo

Palmieri (1406-75), with his Della Vita Cirile. Works of a more popular kind were the prose romances I real di Franca and Guerino il Meschino of Andrea Barberino (1372-1431), the burlesque topical sonelli candati of the Florentine, Domenico di Giovanni (d. 1448), surnamed Il Burchiello, and the rappresentazioni sacre, or religious dramas, which corresponded in some ways to the miracle and mystery plays of England.

In the middle of the fifteenth century two great events occured which were of vast importance in the literary hist, of every European country. One was the every European country. One was the fall of Constantinople in 1453, which drove many Gk. scholars into W. Europe, the other was the invention of printing, which other was the invention of printing, which did not affect I. till 1164. In 1447 the erudite founder of the Vatican Library was made Pope Nicholas V, an election which gave great impetus to the study of antiquity. Another event which influenced It literary hist, was the foundation of the Rom Academy and the Florentine Platonic Academy, the latter of which made the important declaration that It was equal in literary ment to Lat Moreover, in the great centres of literary active. over, in the great centres of literary activity there were grow're up young men of genius who became zealous advocates of genily who became zealous advocates of maintaining the literary traditions of the country. One of these was Lorenzo de' Medici (1448-92), prince poet, and patton of literature His works include Ambra, an Ovidian allegory La Caccua col Fulcone, La Zeucia de Harberno, the Canti cane, I.a. Zeucia at Barnerina, the Canal Carnascaleschi, carnival songs of a some-what licentious character, a number of elegant love poems, besides pastorals and satires. He not merely encouraged, by his personal example, the use of popular literary forms, but he infused into them the culture of the Renaissance The most distinguished of the men of letters who distinguished of the men of letters who frequented Lorenzo's court in Florence were Luigi Puici (1131-37) and Angelo Ambrogini (1454-92), commonly known as Politian. To the former we are indebted for the Morgante Mayyore, a humorous epic in ottara rima, which contains a curious mixture of flippant and irreverent buffornery, lofty sentiment, and religious fervour. Politian, who was a brilliant classical scholar and philologist as well as a poet, wrote the lyne tragedy Orfeo Giostra, a poem on the tournament, and Other protégés of Lorenzo were Antonio Manetti (1423–97) and the famous Girosance of anct culture was similarly fos-tered by Ferdinand I at Naples. Jacopo serve of recumand 1 at Napley. Jacopo Sannazaro (1158-1530) was the first to show that excellent It. prose could be written outside of Tuscany. His Arcadu, a pastorul romanice, foreshadowed by Boc-cacelo's Anclo, is classical in its construc-

which are unfortunately written in Lat. In Ferrara, the literary centre of the N., Matteo Maria Boiardo, Count of Seandiano (d. 1494), enjoyed great popularity as the author of an unfinished poem, Orlando Innamorato, which celebrates deeds famous in old Fr. cycles. The story is original, and though the incidents are ingenious the characters are real people, but the style and diction are lacking in refinement.

The romantic epic, thus for the first time handled with any success by Bolardo, was perfected by Lodovico Ariosto (1474-1533). See Ariosto. His Orlando Furusa is a sequel to the Orlando Innamorato. The works of Ariosto open a new period in the history of It. literature, a glorious period called by Its. the Canqueeralo, which is in many respects equal to that of Dante. Petrarch, and Boccacio. Ariosto

LUDOVICO ARIOSTO

ous mixture of dippant and irreverent buffoonery, lofty sentiment, and religious fervour. Politian, who was a brilliant classical scholar and philologist as well as a poet, wrote the lyric tragedy Orfoo Giosta, a poem on the tournament, and some exquisite shaze per la guestra of the symmetric per la guestra (1432-97) and the famous Giro-lamo Savonarola (1452-98). The Renaissance of anct culture was similarly fostered by Fordinand I at Naples. Jacopo Sannazaro (1458-1530) was the first to show that excellent It. prose could be written outside of Tuscany. His treadu, a pastorul romance, foreshadowed by Bocacofo's Amelo, is classical in its construction of sentences as well as in its setting 1t set the fashion for writing in studied poetical prose, and prescribed the rule for all future pastoral romances. A fellow townsman of his was Glovanni Pontano (1458-1503), the founder and head of the Neapolitan Academy and the author of the cynicism and lack of morality that

was characteristic of the time is prominent in the work of that crafty but far-sighted statesman, Nicoolo Machiavelli (1469-1527). Second to him as a historian is Francesco Guicciardini (1483-1540), who, besides writing of the hist, and gov. of Florence, made a collection of aphorisms for statesmen called Records politics of cirili. The two chief novelists of the sixteenth canture, ware Mattao Bandello and teenth century were Mattee Bandello and Anton Francesco Grazini. Although the former was a Dominican friar, his works reflect the loose manners of the time as much as any of those of his contemporaries. The licentiousness of the It court was embodied in the infamous Petro Arctino (1492-1557), whose letters, pub. in Pens in 6 vols. (1609), are an index to the life of the times. His comedies are lively and saturic sketches of contemporar manners. Other comedy writers of high merit are Giovan Maria Cecchi, Machin-velli, and Ariosto, but the greater number of It. play wrights adopted the conventional methods employed by sirct, writers of Lat. comedy. During the latter part of the Renaissance a literary controversy took pace with regard to the introduction of dielect forms in literature. In the end the 'purists,' who maintained the Tuscan of the fourteenth century to be the literary tongue, prevailed. Chief among them was the crudite Cordinal Bembo (1470-1547) who came to be regarded as the dictator in all matters of literary taste. Other writers of pure and elegant proper were the Martuan Castiglione (1478-1529) and the Tuscan della Casa (1503-56).

The work of Torquato Tasso (1544-95) brings this period to a close, and forms a link between it and the next. He early writings included Rinaldo and Aminta, a beautiful pustoral play, but his life work was the Gravala mine Librata, a noemen a heroic scale, in which is expressed the profundity of his feeling and the deep melancholy of his soul.

The period of decadence which fol-lowed the glorious eld of the Renaissance may be traved back to the middle of the sixteenth contury. The writers of the Scientismo were devoid of imagination of passion of sentiment. The inspiration of passion of sentiment. The inspiration of the Revival of Letters left them cold and barron, and their work is distinguished by its exaggeration, bombast, and artificial-The fashion for this rapid manner of viting was set by Giovan Battista Marini (1569-1625), who, in spite of his far-fetched conceits and extravagant metaphors, showed a vigorous imagination in his poem, L'Adone. His manner was mimicked by le-ser men, and the style which came into vogue was called after him Warmismo. Another characteristic of the Selectitismo is seen in Gabriello Chiabrera of Savona (1552-1637) and his followers, Fulvio Tegti of Ferrara (1598-1646). Francesco Redi of Arezzo (1626-98), and Alessandro Guidi, who initated Pindarlo and other classical metres, and showed themselves possessed of a real tyric gift. The pastoral drams, essentially an artificial production, became extremely popular, the chief examples of the kind being the Pastor Fido of Guarini (1537-1612),

and the Daine of Rinuccini, which was set to muse by Peri and Caccini. Vincenzo Filicaja (1612-1707) is noteworthy as being one of the few writers of this age with real sentiment. Ilis songs have a true patriotic ring, but even they are expressed exaggerated form. A reaction in an against the extravagance of metaphor and against the extravagance of metaphor and the affectation of an exuberant, passionate style became cyldent, and took definite form in the estab. by Giovan Maria Crescimbeni and Gien Vincenzo Gravina of the 'Academy of Arcadia' (1690), which advocated a return to pastoral simplicity. The most noted of the 'Arcadians' were innecenzo Frugoni, Felice Zappi, and Paolo Rolli. But these would-be reformers only escaped one affectation to fall into another; the effeminace of their formers only escaped one autocasson with all into another; the effentiace of their madricals is no better than the hyperbole of Matuni A healthy sign of revolt against Marinismo and Arvadia is seen in the satires of Salvator Rosa (1615-73), a Neupolitan artist and musician and a a Neponian artist and invacian and a foreminer of the eighteenth-tentury patriots and in the mock-heroics of Alessandro Tasson (1565-1638), the author of a section Randa and full pieche. But the most durable work of the Selcontismo was done by scientists like Galfieo Galliei and Fia Paolo Sarpi and thinkers like Glordano Bruno and Torimasu Campanella. The prose of Galileo is distinpanella. The prose of Galileo is digushed by its precision and virility.

The Risorgimento, or Age of Revival, was also prepared by Giambattista Vice, who, in his Scienza nuova investigated the universal laws of bist which had governed the progress of the human race. Lodovico Artonio Muratori, Sciptone Mattel of Ver-ons and Apostolo Zeno epplied thomselves industriously to bistorical research, and Count Giovanni Maria Mazzuchelli of Brescia and Girolamo Tiraboschi showed an interest in the sources and development of interature. Independent criticism found a public plutform in the reviews recently estab on the model of the Eng. Speciator and Taller. Chief of these were the Osser-ial r and Gazrella reneta of Gaypare Gozzi (1713-86) and the Frusta letteraria, m which Ginseppe Baretti of Turin (1719-69) gave vent to his satisfical humour, Most conspicuous among the literary reformers of the Risorgimento was Giuseppe Parmi (1729-99), a Lombard poet, who induded the frivolity and self-indulgence of the society of the time in Del Giorno. Carlo Goldini (1707-93) may be regarded. as the dramatic reformer of the eighteenth century. With Molière as his master, he studied the people living about him and supplanted the commedia dell' arte by

supplanted the commenta are are by conseller of character.

The educated classes in I. were at this time filled with a hope of freedom from the loreign yoke. The idea of therty they found best expressed in the writings of anct Gk, and Lat. writers on whose style they tried to model their own. Vittorio Alfori (1748–1803) made a determined effort ic establish a national dramps. His effort to establish a national drama. tragedus, which are almost invariably based on incidents in Ok. or Rom. hist., may lack artistic finish, but they are in-spired by a noble patriotic spirit. The

chief literary fighters for national liberty at this time followed Afferi in a return to classic models Ugo Foscolo (1778–1827) passionately advocated the political cause in Lettere d. Jacopo Ories, Sepolera, and Ories, which are somewhat marred by his Gargantuan rhetoric. Foscolo should also be noted as a literary critic of high merit. His most important work as such is Dell'. His most important work as such is Dell' origine e dell' uffu to della letteratura he also wrote textual criticisms of Dante and Boccaccio Other classicists of note are Vincenzo Monti (1754–1828), who attacked the Papacy in Superstratone and leanat smo, and expressed his fears for his coun try in Ba smiliana and Peroniade, Giam battista B Niccolni (1782-1861), who battista B. Niccoimi (1782-1861), who wrote tragedies on political subjects, as a g. Anionio Foscarna and Lidonico il Moro, Ippolito Prindemonie (1753-1828), a dramatic poet and Leopardi (1798-1837) the greatest lyrist sunce the Tricento Indignation against Napoleon's aggressive policy roused Carlo Botta (1766-1837) to write a hist of his country during the years 1789-1814. Other historians like him distinguished by their nationism and him, distinguished by their patriotism and by their classic methods, are Cesare Balbo (1789–1854), and Gino Capponi (1792–

1876)
The modern literature of I may be said to have arisen out of the romantic move ment which started in Milan towards the end of the sighteenth century The chief The chief characteristics of the new movement were a renewed study in the aurer trecentists, the classic writers of the fourteenth century, and in all incdit val things, and a keen interest in the works of such men as Goethe and Byron, who represented a similar movement in Germany and England The organ of the new school was the Concilia-tore, a journ il estab in Milan in 1818, and its leader was Alessaudro Manzoni (1785 1873), the author of 1 great historical novel, Promesa 'spost, which owes much to Sir Watter Scott Domenico Georgia; (1864-74) and Mussimo d'Azegho (1798-1865) were successful exponents of the historical novel Giusoppe Giusti (1899-50), a Tuscun won great popularity with his clever engrammatic satires Among the political revolutionists, who were at the same time powerful literary advocates of the cause of librity, should be noted Vincenzo Globert (1801-52), who is also known by his philosophical work, Primato morale a coule digit Italians, Niccolò Tonmasco (1802-74), and Giuseppo Massiri (1802-74) Mazrini (1808-72)

Since 1850 politics have had less in fluence on Italian literature. The transi

tation as a writer of mystic and philoso-plinal novels with an historical setting. The influence of the realistic movement is Edmondo de Anicis (1846-1908), known Edmondo de Amicis (1846-1908), known by his novels and travels, is one of the most popular of writers. The chief women novelists are Grazia Deledda and Mathide Serao, while Vittoria Aganoer, Annie Vivanti and Ada Nogri are women poets of repute. Gabriele d'Annunsio (q v) is a brilliant and versatile writer a dramatist, poet, novelist, and ortic. His genius is undeniable but many crities compleme of the hegentosympes and pear complain of the licentiousness and pesi uturism in literature was linked to that in painting, and indeed showed Fr influence. tt leader was Marinetti, together with Soffici Papini and Ungaretti In criticism and philosophy the outstanding figures are Benedetto Croc e and Giovanni Gentile, while Pasquale Villari's books on Machiavelli and Savonarola have become classics. (note work has been the direct cause of the revival of eathetic criticism throughout Europe, and he is also a philosopher and historian. With the dramatist, Brace o, he is one of the few prominent It. istacco, he is one of the few prominent it, authors who are out of sympathy with the lacest ideas. But there is among sounger people an inevitable reaction grant (rece's characteristic optimism, a naction which often takes the shape of custenzulismo (Existentialism) and homage to 'irtre More specifically postibilit is like and the local scene in new like the like and the local scene in new like the control of the local scene in new like the local scene in the local scene ploit It life and the local scene in novel and story—in, for instance, the Sardinian novel of Grazia Deledida Nobel prizo-emmer in 1927, or in the savesatic but humorous work of Ugo Oletti or of Panzim, Brocchi, Raffaello (aizini, and Martino Moretti, who is also a poet of distinction Other important writers are the novelus Zives (a.) Bleerando Bastinction Other important writers are the novelest Zucca (q 1), Riceardo Bacchelli whose long novel, Il Diazolo al Pastelungo, is descriptive of the Italian anarchist movement and Prof Borgess (q r), who besides being a literary critic, has written a novel hube, reflecting the decadence of life after the First World War Bachelli's work is linked in a personal and direct way not but traditions of Since 1850 pointes have had less in fluence on Italian literature. The transition between the Age of Revival, which roughly speaking, covered the years 1750 1850, and the age of King Humbert is marked by the patriotic poems, stornally pointer, of Francesco dall' Ongaro ontelly pointer, of Francesco dall' Ongaro of Lush') is an achievement equal if not 1868-73. The traditions of the roman tie school were maintained in the poems of Ciovanni Prati (1816-84), but the greatest Italian poet of the post-Risorgi mento, Giosuè Cardined, set on one side the outworn methods of the Romanties, and sought his inspiration in the national literature of an earlier time. The chief followers of his classical manner are Guido

is theatre at Taormina in 1925. With the possible exception of Croce, the Italian writer of the greatest European importance is Luigi Pirandello (q.v.), who exploits a psychological world of half-reality. He is a prolific short story writer as well as play wright, and in fact with him the two mediums are not widely dissociated. The Fascist regime, while not seriously defecting the career of the not seriously denecting the careers of the older estab writers such as Pirandello or Panzini, did not produce any notable literature of its own. The best writing was produced in exile, and the It socialist, Ignazio Silone, gained European fame with his novel Fontemara in 1930 He with his novel Fontemara in 1930 He also wrote a Hustory of Fascasm in 1931 He returned to I. in 1945 Since the Second World War the only important books of verse have been Eugeno Montale's Finusterre (1946), and the complete ed. of Umberto Saba's poetry (1946) These are the major It poets to day. Ungaretti, who has recently issued a trans. of Shabasheare's connect is the most These are the major it poets to day. Ungaretti, who has recently issued a trans. of Shakespeare's sonnets, is the most notable poet of the previous generation Alberto Moravia seems to be the It novelist best known outside his own country Agostino, reputed to be his best book, relates to the disturbance and anxiety with which the discovery of sex afflicts the adolescent — a hackneyed theme which, however, Moravia treats with a kind of lucidity Equality ruthless is Guido Piovene's Pietà contro Pietà ('Pity against Pity') (1946), a novel of contemporary life, crude and subjective, but penetrating. Corrado Alvaro, author of L'Età Breve ('The Brief Age') (1947) is a Calabrian novelist who is well known in I. Among contemporary short story writers the best known are Vitalino Brancati, whose Il vecho copis struct ('the Old Man with the Boots') (1911) is a description of prov Sicilian life under the Fascists; Carlo Cassola and Guglielmo Petroni. The It Resistance movement, unlike that in France, did not result to any travolal literature though pention lieimo Petroni The It Resistance movement, unlike that in France, did not result in any typical literature, though mention may be made of the novel Uomini e no ('Men and Not Men') by Flio Vittorini (1945), whose later work, however, has reverted to the manner of Sarovan, and of the autobiographical sketch. Il Mio granello ('My Grain of Sand') (1946) by Luciano Boris. Among the many new literary reviews may be mentioned Anglica (Florence) devoted to English studies Mercurio, and Il Ponte-all being post 1945 productions Frera Letstudies Mercurio, and I being post 1945 productions Frera Letteraria is still regarded as the best literary weekly publication. In another sphere It writing to day shows intense vigour historical research, philosophy, art criti-cism, and philology are four-shing, and works of this kind are the chief merit of It culture to-day

Music — For early developments con-nected with Rome as seat of the Christian Church, see the article Music The Important movement known as Ars nima, which during the fourteenth century replaced the medieval organum by a poly-phonic style with a much wider harmonic Gk tracedy they rejected polyphony and and rhythmic range, was largely it. (Florentine) in origin; but the composers cided with the introduction of the figured

Gk. theatre at Taormina in 1928. With the possible exception of Croce, the Italian writer of the greatest European importance is Luigi Pirandello (q.v.), who exploits a psychological world of half-reality. He is a prolific short story writer as well as play wright, and in fact with him the two mediums are not widely must be a prolific to the dissociated. The Fascist régime, while not seriously deflecting the careers of the older estab writers such as Pirandello or (Eng ballet), and the canonic cacua (Eng. (Eng ballet), and the canonic caccia (Eng. catch), all characterised by harmonic catch), all characterised by narmonic amplicity, lightness of mood and concentration of melody, always a strong feature of it music Verse and music were closely integrated, sometimes dancing and instrumental accompaniment were added The Laudi Spirituili, popular hymns influenced by plainsong, originated at Florage in the fourteenth century and at Florence in the fourteenth century and later became an important element in oratorio The union of it, secular song and Flemish poly phony produced a valu-able art form in the madrigal, whose style, anie art form in the materigal, whose styre, imitative rather than contrapuntal, was founded on a perfect balance between words and music. Its earliest masters were Flemish, notably Willaert and Lassus, but it was soon taken up by native composers and reached its height in the work of Marenzio (1)53 99), Gesualdo (c 1:60-1615) and Monteverdi (1567-A severer method, influenced less by popular song and more by the motet, was cultivated at Rome, first by Costanzo (152)-94) Charged by the Pope with the purification of church music, Palestrina purination of church music, raissuring evolved a style, compounded of it lyricism and the solid contrapuntal achievements of the Fletnings, that crowns the whole polyphonia period

The leaders of instrumental music were

the Venetians. Venue, the centre of music printing, became in the sixteenth century the bub of European musical life. The earliest surviving lute books, consisting of transcriptions, dances and fandasi w, date from 1.07.09. The canzona and recrure, originating in thans riptions of the Flemish motet, were cultivated by Anire Gabrieli (c. 1510-86) and developed by Claudio Merulo (1-33-1604) and devolutional Gabrieli (15-)7-1612) into independent compositions for organ. Another new instrumental form was the loccata, in new instrumental form was the locala, in which a genuine keyboald technique became apparent. Among Giovanni Gabach's innovations was the use of voices and instruments in antiphonal groups, this arise from the shape of St. Mark's Cathedral, which required the divoof the choir into two parts, each with its own organ. With Freescobaldi (1583–1644) the grouper dividend into the own organ With Frescobalda (1583-1613) the ricercare developed into the

modern fuguo
About 1600 Italy produced two new large scale forms, opera and oratorio. The earliest operas were the work of an adistocratic Florentine group known as the Camerata, chief among whom were Peri (1561-1633) and Carcini (1545-1618). Endeavouring to revive the methods of

Another approach to the stage was h the madrigal: Orazio Vecchi through the madrigal; Orazio (1550–1605) wrote an early dramatic work in the form of a string of madrigals, and Monteverdi, in whose madrigals the music had become more and more an emotional illustration of the text, turned to opera in 1607. He greatly enriched its orchestral element and range of harmonic expression. which he put to true dramatic use. ancestor of the oratorio was the medieval morality play, as developed by St. Philip Neri (1515-95) at his oratory in Rome. The first oratorio proper, by Cavalleri (c. 1550-1602), was produced in 1600 with scenory, costumes and dancing. It difseenory, costumes and dancing. It dif-fered from opera only in its othical subject. During the seventeenth century both these forms, especially opera, sprend throughout Europe, but the It. love of seenic and vocal display caused an increasing emphasis on virtuosity at the expense of dramatic truth and orchestral colour. The operas of Cavalli (1602-76) and Cesti (1623-69) saw the gradual and testi 1023-03) saw the gradual separation of aria from recitative, a process standardised by Alessandro Scarlatti (1660-1725), a great melodist, who establishe it. overture da capo aria, opera buffa and the two aimbout recitative. He also should be observed to construct ejected the chorus, whose part in oratorio however had been extended by Carissimi 1605-74) Another form, coeral with opera and oratorio, reshaped by Carissimi and soon pipularised abroad, was the cantata, whether sacred (da chiesa) or secular (da camera). Opera in the It style and language continued to dominate the stages of Europe throughout the eighteenth century, aided by the vogue of the male soprano or castrato. The librettos of Metastasio (1698-1782) imposed a still Methotasio (1998 1782) imposed a still stricter formalism, but the quality of the music doclined and the dramatic element all but vanished. Of many it, operatic composers Pergolesi (1710-30) is remem-bered for his success in opera buffa.

The leading It. keyboard composer after Froscobaldi was l'asquini (1637–1710)
The great advances made in N. It. in the evolution of the violin family led to an exevolution of the violin family led to an ex-tension of instrumental music parallel with that of opera. It was this age that gave to music many of its familiar It terms. The sonata, originally any piece written for instruments (as opposed to cantata, a piece for voices) and more or less synonymous with canzona and sin-fonia, developed like the cantata in two forms: sonata da chiesa, derived from the old polyphonic style, and sonala da camera, based on popular dance measures. works were at first written for sev. instruments, generally of the violin family, but in time were confined to one or two supin time were confined to one or two supported by a string bass and continuo
(figured bass) on the harpsichord. The
(figured bass) on

Geminiani (1687-1762), Vivaldi (c.1675-1741), a many sided composer who influenced Bach, and Tartini (1692-1770), who improved the technique of the violin. The pianoforte was invented about 1710 by an It. Bartolommoo Cristofori (1655– 1731), but did not at once become popular, and the greatest It. keyboard composer, Domenico Scarlatti (1685-1757), wrote for the harpsichord. His very varied onemovement sonatas have the greatest artistic and technical importance.

After 1750 It must lost its begemony. Opera buffa alone retained some vitality in the works of Paisiello (1740-1816) and Cimarosa (1749-1801). A spark of brillance was supplied by Rossini (1792-1868), who however, like other its. of his romantic opera in Paris. Native melody and vocal virtuosity continued to find expression in the operas of Donizetti (1797-1848) and Bellini (1801-35) and in the early work of Verdi (1813 1901), a direction of the operas of the early work of verdi (1813 1901), a direction of verdi (1813 1901), a directio dramatic composer of rare genius, who in his later operas achieved a perfect balance between drama and music, thus at last reaching the standards set by Monteverdi. During the late eighties a new type of opera, based partly on Fr. and Ger. models and known as revismo from its attempt to reproduce the situations of every-day life, was initiated by Mascagni (1863– 1945) and Leoneavallo (1858–1919). But their operas and those of Puccini (1858-1924) a composer of greater refinement, are marred by a search for effect that is too often neither musical nor truly dramatic but melodramatic.

Towards the end of the nineteenth cen-Towards the end of the nineteenth century it. Interest in instrumental music, dead for more than a century, was revived by Sgambati (1841-1911) and Martucei (1856-1909), and their successors have cultivated all the possible forms, both vocal and instrumental. The most important composers are Respighi (1879-1936), best known for his rich orchestral works, Malinian (A. 1862). Desertif (1864), best before the contract of the cont piero (b. 1882), Pizzetti (b. 1880), both of whom have adopted a more serious instrumental style, Casella (1883-1347), whose output is celectic, and Dallapiccola (b. 1904). But Italy has not yet found an operatic successor to Pucchil.

Italian.

Italy, British Army in (First World War). The disastrous It. defeut at Caporetto (q.r.) occurred in Nov. 1917, but before the close of the year the Brit. Gov. sent out five divs. It is undoubted that these reinforcements were a vital moral influence in restoring what seemed a desperate situation. In March 1918 two of these divs. were, however, sent to France in view of the impending Ger. attack on the W. Front. When the Austrian offensive of May 1918 opened the Brit. forces, under the command of Gen. the Earl of Cavan, were disposed on the Asiago Plateau. While the Its, were repulsing the enomy in the Adamello passes the Brit. repulsed them on the plateau and both allies took many prisoners and guns. On June 15 the Austrians Italy, British Army in (First World War). oners and guns. On June 15 the Austrians launched a heavy offensive from Asiago to the sea with 600,000 men, crossing the Plave the same day at Montello and near the mouth. The Brit. forces, which in-cluded several battalions of the Royal Fusiliers, played an important part in hurling the Austrians across the riv. again and involving them in the tremendous and involving them in the tremenques defeat of the early autumn, which ended in the armistice with their being signed on Nov. 4. The total number of Brit, forces employed in Italy was about 101.000 combatant and 44.000 non-combatant troops, the maximum strength at any one time being about 90,000 combatant troops. The casuaties were, killed and died of wounds, 1057, missing and prisoners, 670, and wounded, 1971.
Italy Star, Brit military decoration, instituted in 1915 for entry into operational service on land in Stelly or in Italy at any

service on land in Sicily or in Italy at any

service on land in Sicily or in Italy at any time during the campaign there from capture of Pantellaria on June 11, 1943, and until May 8, 1945. The ribbon is in It. colours, green, white, and red. Itch, any irritating skin disease. The commonest form is scalies, a disease caused by the animal parasite, surceptes scales, which burrows under the skin and causes intense irritation leading to scratching on the part of the retains with scratching on the part of the patient with scratching on the part of the patient with resulting rawness, scabs, and escenations conditions. It may occur on any part of the body, but rarely on the scalp and often between the flugers. The treatment is application of sulphur cintment. Barber's tich is caused by a fungus and affects the hair follicies, particularly those of the beard. The inflammation set up leads to the formation of pustules at the root of the nave of the church of the Annunziata, each hair affected. Cuban itch, an irritation the beli-tower of S. Maria, and the facade ing skin disease introduced by soldiers of St. Michele Arcangelo remained intact, from Cuba; it is supposed to be a mild variety of smallpox. Coolie tich, a skin-inflammation common amongst field-workers in Assam and other tropical countries. It is caused by the larva of uncharis duodenutis, and the eruptions are confined to the surface of the lower extremities.

Itch-mite, name given to the species of Sarcoptine, a sub-family of archnids which are parestic on the skin of mammals, birds, and insects. Notceres, Prosopodectes, Sarcoptes, and Chortoptes Prosopodectes, Sarcoptes, and Charloptes are among the commonest geners. S. sabes attacks the skin of man, and produces the disease known as scables.

Ithaea: (1) Now called Thiaki, one of the Ionian Isles, and lies E. of Cephalonia. the Ionian Isles, and lies K. of Cephalonia. It has an area of about 37 sq. m., and is mountainous. Wine and olive oil are the chief productions. The chief in is Vathy (pop. about 3,200). This is, is noteworthy as having been the home of Ulysses. Pop. about 8,800. (2) in., the cap. of Tompkins co., New York, U.S.A. on Cayuga Lake. Cornell Univ., the New York State College of Agriculture, the Athra Couservatory of Music, and the Empire State School of Printing are situated here. Pop. 19.700.

Itû, or Itû, tn. in Brazî, on the R. Tiete, 70 m. W.N.W. of São Paulo. It is the centre of a great cotton, sugar, and coffee producing dist., and has cotton factories, and iron and bronze foundries. Pop. 38,000.

Iturbide, Augustin de (1783–1824), for ten months emperor of Mexico, was a Creole by birth. In early life he much distinguished himself as a soldier in the rovalist cause, which was then endangered royalist cause, which was then endangered by Hidalgo's and Morelo's rebellions. In 1822 he accepted from his devoted soldiers the title of Emperor Augustin I., for the 'Sp Cortes refused to recognise the virtual independence of Mexico as set forth in the independence of Mexico as set forth in the treaty of Cordovs. After a compulsory abdication (1823), the result of his arrogance and despotian, he went into exile, and on returning was met and shot. See M André, La Fin de l'Empire espagnol de l'Amérique, 1922.

Iturea, dist. in anct Syria, lies between Damascus and the Lake of Tiberias in N. F. of Dalactine.

NE of Palestine.

Itzehoe, tn. of Germany, on the Stör,
44 in N.W. of Hamburg, is the oldest
town in Schleswig-Holstein. The castle
of Enselsfieth, round which it was built,
was erected by Charlemagne, 809. Pop. 20,000.

Iuka, tn. in Mississippi, U.S.A., county seat of Tishomingo co., is 22 m S.E. of Corinth. Here the Federals under Gen. Rosencrans defeated the Confederates under Gen. Price in 1862. Pop. 1,400. Iulus, see JULUS. Iulus, see ASCANUS. Ivan, or John, name of six grand dubag.

Ivan, or John, name of six grand dukes

of Moscow and tsars of Russia.

Itan I (1301-41), surnamed 'Kalita,' or 'Money-Bag,' because of his strict economies, consolidated scattered Russian ters, conquered Moscow and Tver, and made the former city the metropolitan see in place of Vladimir.

from II. (1326-59), son of the above, was a 'gentle and merciful prince,' but a weak ruler, who much diminished the grand duke's prestige. He began to

reign in 1353.

Trum III. (1440-1505), called 'the Great,' ascended the throne in 1462. He commander Svenigorod crushed the power of the invading hordes of Tartars (1481). I introduced fire-aims and cannon into Russia (1475), and also forced the hereto-fore independent kingdom of Novgorod to acknowledge his successity (1478). He disreparded his boyars, and ruled as an autocrat.

Iran IV. (1530-84), called the 'Terrible.' grandson of the above, came to the countries. He was made Prince in 1907. The Frandson of the above, came to the and appointed resident-general of Korea and Anter the Russo-Japanese War, meeting his doath at the hands of a Korean at Kharbin.

Kharbin.

Itri, small tn. of Littoria, Italy. It was the bp. of Fra Diavolo. As a result of the Second World War the tn. and its otherwise are in ruins. The central part of number of ruthless massacres. 1682, and was associated in power with his half-brother, Peter. He was quite deficient in personality, and became the

tool of stronger men.

Ivan VI. (1740-64) never reigned, but passed practically the whole of his life in solitary confinement till his murder in

Ivan Gorod, see NARVA.

Ivanov, Nicholas (c. 1858-1918), Russian soldier, son of a common soldier accidentally killed when I. was twelve years dentally killed when I. was twelve years old at a military review in presence of Alexander II, who had I. admitted to a military school and helped his advancement. In the First World War he commanded one of the armles operating in Galicia; won much distinction, capturing Lemberg and Przemysl. In 1915 after the Russian retreat, he resigned his command, but was retained at headquarters by the Tsar—who telegraphed to him when the revolution threatened. I. thereupon made a dash for the cap.; but when he learned that he would be totally unsupported there, he desisted. On unsupported there, he desisted. On Feb. 16, 1918, it was reported at Petro-grad that I. had been killed in action at Kiev.

Ivanovo (or Ivanovo-Voznesensk), region and tn. of central Russia. The tn. was formerly in the gov. of Vladimir and is situated 60 m. N.N.E. of Vladimir. Sown situated ou m. N.N.E. of Viadinir. Sown grasses form an important part of the agric. economy in the I. region, which is also noted for dary farming. I. is the Manchester of Russia—the centre of the cotton-spinning and weaving industry. There are also chemical works. Here is also one of the large regional peat-electric powers stations of Russia. I is conpower stations of Russia. I. is con-nected by rall with Moscow, about 180 m. distant. Pop. (tn.) 285,000, (Region) I. is con-4,500,000.

Iveagh, Edward Cecil Guinness, first Earl of (1847–1927), Irish philanthropist; third son of Sir Benj. Lee G., M.P., first Bart. Educated at Trinity College, Dub-lin. From 1886 he was chairman of the limited company then formed to take over the business of G.'s brewers, but he retired from active work on the board in 1889. His first charitable donation was a quarter of a million to be spent in building homes for the poorest workmen of London and Dublin. This fund is now controlled by the London and Dublin Guinness Trusts for Housing the Poor. Guinness became a peer in 1891, and soon afterwards embarked on a scheme for clearing and replanning seven acres of slum in Dublin city. Here he arranged for labourers' dwelling, a public pleasure garden, swimming baths, and a concert hall. Although a Unionst, he was offered the Lord-Mayoralty of Dubin in 1909. In 1919 he was made an earl.

Ken Wood Mansion, together with its

pictures and furniture, were bequeathed in 1928 by i., for the benefit of the public;

Ivan V. (1666-1696), became tear in the endowment fund are controlled by 82, and was associated in power with trustees. There are 68 paintings, including representative pictures by Boucher, Crome, Cuyp. Gainsborough, Frans Hals, Hoppner, Landseer, Lawrence, Morland, Van Ostade, Raeburn, Rembrandt, Rey-

van Ostale, Rasburg, Remorald, Rey nolds, Romney, Rubens, Turner, Van Dyck, and Vermeer. Ivel, tributary of the Great Ouse, flow-ing N.E. and N. through Bedfordshire, England. The confluence is at Temps-ford. Length 30 m.

Iverna, see HIBERNIA.

Ives, Frederic Eugene (1856–1937), Amer. photographic inventor. At age of eighteen was put in charge of the photographic laboratory of Cornell Univ.; so remained till 1878, when he invented the first half-tone process; invented the process in 1886. He also invented in 1894 the photo-chromoscope which a single positive image in natural colours is produced by a combination of three negative ones. The reader is recolours is produced by a combination of three negative ones. The reader is re-ferred to I is own publications for the best account of his work. These include Iso-chrimatic Photography (1886), and A New Principle in Heliochromy (1889). Iveston, vil. in the co. of Durham, Eng-land, situated about 9 i m. N.W. of Dur-ham. Pop. about 6000.

ham. Pop. about 6000.

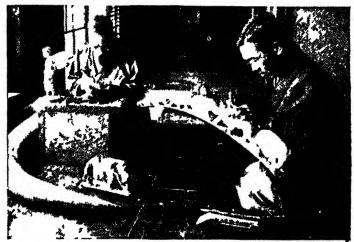

Ivinghos, vil. of Bucks., Eng., 9 m. from Aylesbury. It has a fine lifteenth-century church. I. Beucon (762 ft.) and roin Aylestony. It has a fine intesting century church. I. Beacon (762 ft.) and Ringshall or I. Common were acquired by the National Trust in 1926. I. mill, between I. and Pitstone, 3 m. N. of Tring, Herts, is probably one of the oldest remaining post-mills in Eng. It is preserved as a historic landmark.

Iviza: (1) One of the Balcaric Isles, stuated in the Mediterranean Sea, between 50 and 60 m. from the coast of Spain, to which country it belongs. This is. has a much indented coast and a mountainous and well-wooded interior. The

chief productions are fruit of various kinds and sait. Pop. 23,500. (2) The cap. of the above is. It is a fortified tn., and was the see of a bishop. Pop. about 6500. Ivory, term properly given only to the material which forms the tusks of ele-phants and is 'that modification of den-tine, or tooth-substance, which in transverse sections or fractures shows lines of different colours, or strize, proceeding in the arc of a circle, and forming by their decussations minute curvilinear lozenge-shaped spaces' (Sir Richard Owon, Lectures, 1856). These tusks are sometimes of tremendous size, a single specimon oc-casionally weighing 200 lb., and are dis-tinguished from the teeth of most animals in that they are imbedded in semi-solid wascular pulp, and continue to grow in size during the whole life of the elephant. The turn ivory is often extended to a similar substance obtained from the walrus, narwhal, hippopotsimus, etc. The I. from the African elephant is the most estremed on account of its superior denno 1225 by 1., for the benefit of the public; estream a on account of its superior defi-tegether with an endowment fund of \$250,000. He also bequeathed the grounds is also obtained from India, Ceylon, and park of some 74 ac. to the public. The Burna, and the is. of the K. Archipelago. Burna, and the is. of the K. Archipelago. In African elephants both the males and L.C.C.; the Mansion and its contents and females have tusks, although those of the sity and whiteness, but a certain amount is also obtained from India, Ceylon, Burma, and the is of the K. Archipelago. In African elephants both the males and

males are larger, but in the Indian species the females are practically tunkless The 'fossil' I obtained from the extinct mam moth in Siberia is too brittle to be of much moth in Siberia is too brittle to be of much value. Antwerp is the chief market for I I. is valued according to the size and soundness of the tusks The natives have discovered the superior value of newly obtained tusks, and paim off a large quantity of 'dead' I, which has been buried for centuries, upon unwary traders The special qualities of I, its beautiful texture and tints, its perfect elasticity and adaptability to the carver's tools, have been recognised from the earliest times,

seals, hunting-horns, knick-knacks, snuffseels, hunting-horns, knick-knacks, snur-boxes, toilet combs, mirror cases, chess-men, and draughts. Prehistoric man used pices of bone, horn, and ivory for his sketch book and scratched on it drawings of animals. The anct Egyptians and Assyrians used ivory for domestic pur-poses and for the decoration of furnture, but Egyptian ivory statuettes have also been found The Gkz used ivory for the decorations on the trappings of their decorations on the trappings of their horses and for the bosses of their shields and for small boxes and caskets, but we possess few examples of Gk. especially of the early period Of Rom.

Vege able I is the name given to ' Corozo Nuts. the hard white, potato like endosperm contained in the seeds of the paim like tree (Phytelephus mucrocarpa) which grows in the low hot valleys of the Andes valued at about \$10 a ton, and is used for buttons, etc. For another substitute for L. see CELLULOID See A. Maskell, Ivortes, 1906

Ivory Carving Since earliest times ivory has been used either alone or in con decorative material Ivory has always been used considerably for the decoration of palaces and the Roms sent an ivory throne to Porsena, while, in the nine teenth century, an Indian Prince sent one to Queen Victoria. Ivory has also been used a great deal for religious purposes in

and plaques which are beautifully carved in relief. The subjects of these carvings were usually classical myths or pictures of Rom gods. The carliest Christian ivories in existence date from the time of Constantine and among these we have and book covers hyrantine lyories are very numerous and beautifut, and if the figure of Christ, so often portrayed, is indicated to be sterrotyped the decorative designs of these is one are excellent. Up to the end of the fourteenth century, lyory carvings were usually of religious subjects, although often used for secular turposes, but after this date hunting turposes, but after this date hunting scenes deeds of chivalry and pictures of tournaments were depicted, the sculptures being influenced by the romantic literature of the period. In India, wory has been much used for caskets, many of such things as crucifixes, the heads of pass such things as crucifixes, the head suc

than beautiful, and consist chiefly of claborately carved balls and models of victory of Henry IV. of Navarre over villas. Jap. ivories are usually vory mall, but very well designed and finished. Most Jap. ivories are comparatively modern. In modern times ivory has been used for soulpture, cither alone or in conjunction with bronze and jewels. One modern example of ivory sculpture that may be mentioned is the 'Lamia' by George Frampton. This piece is the bust and a woman. The face is life-size and which climbs by means of its rooks, bears modern example of ivory sculpture that may be mentioned is the Lamia by George Frampton. This prece is the bust of a woman. The face is life-size and carved out of ivory, while the head-dress

and dress are of bronze. lvory Coast, Fr. colony on the W. coast of Africa, bounded on the S. by the gulf of Guinea, W. by Liberia and Fr. Guinea, N. by Upper Senegal on Niger, and E. by the Brit. colony of the Gold Coast. The low beyond which the ground rises from a general height of about 1000 ft. to the plateau of the Kong ter. (4757 ft.), which is largely covered with almost impenetable neglectors. is largely covered with almost impenetrable, primerval forest, intersporsed with patches of savannah. The rivs are of little importance, and all drain into the guil of Guinea. The chief products are maize, plantains, rice, bananas, pineapples, limes, and other fruits, all of which are cultivated by the natives; and rubber, ecceptuate covers the production of which coco-nuts, cocoa, the production of which is fostered by the Fr. for the export trade. is fostered by the FT. 107 the export trausc.
There are also mahogany forests. The exports, comprise chiefly paim kernels, paim oil, cacso, rubber, mahogany, cotton, and cocoa. The imports are chiefly tobacco, wines, and metal and cotton goods. The seat of administration, previously at Bingerville (native Adjame), with a European non. of only about 100. with a European pop. of only about 100, has been transferred to Abidian (pop. 26,000). The ports are Grand Bassain (in the neighbourhood of which some gold is found), Assinie and Grand Lahou ; other chief to. in the interior, Dimbokro, Aboisso, Onagadougou (16,500), Bobo-Dioulasso (18,600) and Bouaké, From Dimbokro, Dioulasso (18,600) and Bouake, From Abidjan a railway runs N. to the oil and rubber dists., as far as Taffré. a distance of 300 m., and it is now proposed to extend this to the Niger. There is a large network of roads suitable for motor traffic (11,000 m.). There are six wireless stations in the colony. The colony was estab. In 1899, the coast having been set-tied in 1843, and the 'huterland 'in 1883. In 1933 a part of Upper Volta was added in 1933 a part of Upper voits was added to the I.C. Area approximately 180,000 sq. m. Pop. 4,056,000. (Europeans, 3,800). See T. J. Clozel, Dix ans a la Côted' Ivoire, 1908; R. Villanour and Inchmond, Notre Colume de la Côte d'Ivoire, 1903; and La Côte d'Ivoire, 1908; G. Hanotaux, L'Empire colonial français, 1929.

J, tenth letter of the Eng. alphabet, is one of the few permanent additions of the Middle Ages to the Sentiti-Cik.-Lat. alphabet. In exact terms, it was not an addition, but a differentiation from an existing letter. I in Lat., besides being a vowel, had the consonant value of y, as in index and major. The symbols i and j, a lengthened form of i with a curve to the left, were used in the carly Middle Ages indifferently for both the consonant and the vowel sound, the sign j being used in hands current at this time. At a later stage, from the fourteenth century onwards, the symbol j was used for distinctive purposes, particularly when I had to be written initially or in conjunction with another i. The sound j (dsh) came into England through Fr., where it had changed in sound from y to sh, cf. Fr. juge which became Eng. 'judge,' but the Lat. value of j as y may still be found in words of Heb. or cheer origin, as halletujah, junker, and so forth. In Fr. the sound sh was also represented by g. Consequently, such words, in passing into Eng., 'y sex,' This accounts for variations in the spelling of words like 'judge,' have an alternative spelling of words like 'gad '-' jail,' 'gibe'.' Jewes,' This accounts for variations in the spelling of words like 'gad '-' jail,' 'gibe'.' jibe,' 'Geoffrey'-' Jeffrey,' 'serjeant'.' sergeant,' and so forth.

Jabal, see JUHAL.

Jabal, see JURAL.

Jabalpur, or Jubbulpore: (1) The most northerly div. of the Central Provs., India, and also a dist. Area 18,950 sq. m. Pop. 2,100,000. (2) The cap. of above div., 150 m. N.E. of Nagpur, near the Nerbudda R. Formerly the Great Indian Peninsular railway ended here, and the E. Indian railway system began; but between 1920 and 1930 the Great Indian Peninsular railway took over the railway between J and Allahabud and the junction of these lines is now at the latter in It is also a commercial city and manufs cotton goods, tents, and carpets. Pop 125,000.

Jabary, or Javary, riv. in S. America, a trib. of the Amazon, joining it near Taba tinga after a course of 400 m. It forms part of the boundary between Brazil and Peru, and is navigable for 300 m. Jabbok, mt. stream of Gilead, E. Pales-

Jabbok, mt. stream of Gilead, E. Palestine, is one of the prin. tribs. of the Jordan. It rises in Jehel Hauran and enters the Jordan 30 m. above the Dead Sea It has many scriptural associations, and is first mentioned in connection with the meeting of Jacob and Evau. It is now called Mahral-Zarka, from the fortress of Zarka which stands on its banks between Damascus and Mecca. Its length is 110 m. Jabes, sec. Jayra.

Jabesh-Gilead, city of Gilead in Pales - motionless on tree and are t tine, E. of the Jordan, is important in religious hist. According to Josephus it species is the Jacamerops grandis.

was the metropolis of the Gileadites. Here Saul and his three sons were buried. The site is now uncertain.

Jabiru, or Mycteria, genus of birds belonging to the Stork tamily (Ciconidea). The Amer. J., which is found from the Argentine northward to Mexico, stands sometimes as much as 5 ft. high, has pure white plumage except for a black neck and head, and massive, slightly-upturned bill. Other species occur in India, Australia, and Africa.

Jablonec nad Nisou (Ger. Gablonz), tn. of Crechoslovakia, situated in the N. of Bohenna, about 7 m. S.E of Reichenberg. It is famous for its trade in glass and artificial gerns. It also has textile industries, paper mills, and printing estabs. Pop. 34,000.

Jablonica (or Jablonitza) Pass, in the Carpathian Mts., due W. of Cernowitz (Ternauti). During the First World War the Russian S. Army captured this important pass in Aug. 1916, a movement which had some influence upon Rumania's participation in the war on the side of the Entente. The pass is now in the Ukrainian S.S.R.

Jabneel, tn. in Palestine, between Joppa and Ashdod, 3 m. from the Mediterranean. was an anot. Philistine stronghold. It was taken by the Israelites and played an important part in Jewish hist. It was conquered by the Maccabeans and became the centre of Jewish scholarship The sittings of the Sanhodrin were held here after the destruction of Jerusalem. Near the modern vil., Yabna, built on the auct. site, are the remains of a fortress built by the Crusaders. The Jabneel mentioned in Joshua xxi, 13 is situated S.W. of the sea of Galilee.

Jaborandi, native Brazilian name for a number of drugs prepared from sev. rutaceous plants, but parteularly from the leaflets of Pilocarpus pennalifolius. The leaflets, when dried, an valuable for their slalagogue and diaphoretic actions. Phey contain two alkaloids, pilocarpine and jaborine, a volatile oil and a bitter substance. The effect of J. is to produce muscular relaxation, salivation, and perspiration.

Jaca, fort. tn. in Spain, in the prov. of Huesca, on the Arragon, 66 m. N.E. of Saragossa, with a famous old cathedral. Pop. 5000.

Jacamars, little-knewn species of birds, found in the dense tropical forests of S. America, E. of the Andes, and classed in the family of the Gaibuildæ. The golden, bronze, and steely lustre of their brilliant plumage, and the length and sharpness of their straight bills, are their chief characteristics. They are usually seen sutting motionless on trees and are therefore counted dull and supid. The largest species is the Jacamerops grandis.

Jacana, or Parides, family of birds whose most striking feature is the length of their toes and claws, which enables them to travel on the fist leaves of water-lilies and other riv. plants. Their eggs illies and other riv. plants. Their eggs are a rich olive-brown, usually streaked with dark lines. The common J. (Parra

jacana) of Brazil is black with green plumage on the wings and a warm-brown neck. In habit it resembles a water hen. The Hydrophasianus, or pheasant-tailed J., frequents the marshes and lagouns of India and China and 14 the largest of all the genera.

Jacaranda tree, genus of Bignoniacee, found in tropical America, consists of found in tropical Alterica, consists of about thirty species which are noted for their heavy, fragrant wood; these are also frequently known by the name of rose-wood. J. oralifolia, the green ebony, and J. mimosifolia, a native of Brazil, are

common species.

Jacobus, or Hapale jacobus, name of a species of Primates belonging to the family Hapalides or marmosets; they are small monkeys found in S. America; their fur is soft and their general appearance aguirrel-like; the tall is ringed, longer than the rest of the body, and not pre-hensile. They are arboreal and feed on insects and fruits.

insects and fruits.

'J'Acouse': (1) title of a famous open letter, written by Emile Zola to the President of the Fr. republic and pub. in L'Aurore, in which he fiercely exposed the official attempts to burke the facts in the notorious Dreyfus affair (2r.). The letter was pub. on Jan. 13, 1898, just after the acquittel of Esterhazy, and Zola was in consequence prosecuted; and though defended by Labori and Albert Clemenceau (brother of Georges Clemencau), he was convicted and sentenced to a year's imconvicted and sentenced to a year's imprisonment. He subsequently took restant on a Carolina for a Ger. pamphiet by Dr. Richard Greitle U.S.A., and still to-day, with Thomas of a Ger. pamphiet by Dr. Richard Greitle U.S.A., and still to-day, with Thomas Jefferson, one of the patron saints of the ling, pub. at Lausanne in April, 1915. It

is a strong indictment of the Ger. ringleaders who were accused of being responsible for bringing about the war, and is an illuminating commentary on Ger. mentality, placing in a dazzling light the responsibility for the general attack on European liberties. The paniphlet repeats Liebknecht's accusation (manifesto of Dec. 2, 1914) that the whole outbreak was a question of an avoidable war formented by the war parties of Germany and Austrie, and that Germany and Germany alone could have made Austria listen to the voice of reason. The book charges Bethmann-Hollweg with high treason for that on Aug. 14, 1914, he lied with effrontery to the Ger. people in proclaiming to the Reichstag that the war into which he was forcing it was a defensive war. It goes on to say that the prin. culprit was the Kaiser, on whose volte-face executed since 1910—when the Emperor seems to have been a friend of peace—it passes sentence of dishonour.

Jacinth, see HYACINTH. question of an avoidable war fomented by

Jacinth, see HYACINTH.

Jackal (Turkish chukdi, Persian shagha),
name applied to many species of the genus
Cunts, but is properly restricted to Cants
aureus, which is a woldsh, wild, dog-like
animal found throughout S. Asia and E. Europe. In colour it is a grey-yellow, the back being darker than the belly. The tall is bushy; the teeth and round eyetail is obsny; the techn and round eye-pupils resemble the dog's, and its length is some 2 ft. or, with the tail, 3 ft. The shrick of a J. is even more dismal and hideous than a hymna's, and the Arabie name Deeb (howler) is certainly appro-priate. The common food of Js. is poultry and small mammals, but as they positry and small mammals, but as they are fond of marauding by night in packs of 200 or so, they sometimes carry off sheep and antelopes. Other species besides the common J. are the Egyptian wolf (C upaster), the striped J. (C lateralis), and the J. wolf (C untus), Jack-s-lantern, popular name of Ignis fature (a m)

fatures (q.v.).

fature (q.v.).

Jackass, Laughing, name given to the species of Dacelo, a genus of coraciform birds. See Laughing Jackass.

Jackaks, Daw, or Corrus monestic, species of crow. It is smaller than the rook and rarely exceeds 14 in. in length. The plumage is glossy black with purplish wings. Usually it lays five bluish-white ever motthed with tiny dark brown species. wines. Usually it lays five bluish-white eggs, mottled with tiny dark brown spots, and it invariably chooses a hole in which to keep them, often the hollow of a tree, a rabhit burrow, a beifry tower, or a castle turret. It is one of the best of the bird-architects, and has been known to pile a stack of loose sticks 12 ft. high. In disposition it is remarkable for its temerity, demostlets and cunnific Smalls worms. domesticity, and cunning. Suells, worms, and insects are its thief food, indeed farmers are indebted to Js. almost as much as to rooks for the destruction of pesti-ferous insects. Js. are common residents in most parts of the world, though they seem not to be known in America.

the tn. of Monroe. Both his parents were engigeants from Ireland. Although only thirteen at the closing days of the Amer. War of Independence, he took his place in the fighting ranks. He lost his two brothers in this war, and his mother died from exposure while nursing Amer. soldiers. J., having fought his way to education and the law, migrated to what was then considered the W.—the future state of Tennessee. Here by turns he was public prosecutor, planter, storekeeper, judge, and member of Congress. When the young Amer. nation and Great Britain entered on war in 1812, the Creek Indians also made war on the Amers. J., in charge of Tennessee troops, led a punitive expedition, and defeated the Indians in two decisive battles. In the autumn of 1814 Great Britain sent Gen. Sir Edward Pakonham, with a fleet of fifty vessels and 16,000 veteran soldiers to take New Orleans. The Brit. easily sank the Amer. flotills of gun-boats and landed troops. Unknown to both sides, Great Britain and America had signed a treaty of peace. Thus, a whole series of buttles occurred rinis, a whole series of outres observed while a ship was in ind-occan hearing the good tadings. J. defeated the Brit. generals Pakenham ',' Gibbs, who were killed while gallantly leadings their troops into action. J. became a national hero, and the country turned to him in 1818 when the Seminole Indians raided Amer. ter. from the safe jumping-off place of Florida, then still a Sp. possession. J. not only defeated the Sominoles, but, against orders, invaded Florida and as a result of his action Spain sold Florida to the U.S.A. and J. became its governor. In 1823 he was chosen U.S. States Senator for Tennessee. In 1825 he ran for the presidency as a Democrat, other candidates being John Quincy Adams, W. H. Crawford of Monroe's cabinet, and the famous orator, Senator Henry Clay. J. received the highest number of electoral votes, but the decision was thrown into the House of Representatives. Clay lent his influence to Adams, who thus became president. In 1828 J. had his revenge Adams can for re-election, with J. once more the Democratic nomines. J. obtained an enormous popular as well as electoral vote. He was the first genuine self-made man of the people to become president of the U.S.A. In 1832 he was re-elected. His second term was marked re-elected. His second term was by his breaking the U.S. Bank. He hold that it had too much power, and was a corrupting influence in Amer. political life.

The bank's charter was rescinded. He The bank's charter was resonded. Its retired at the end of his second term, dying a lonely old man at his residence, the Hermitage, near Nashville, Tennessee, on June 8, 1845. See life by J. S. Bassett. 1916, and A. M. Schlesinger, The Age of

1916, and A. M. Schlesinger, The Age of Jackson, 1945.

Jackson, Sir Barry Vincent (b. 1879), Eng. theatrical manager, b. at Birmingham; founder of the Pilgrim Players.
1907; founder and director of the Birmingham Repertory Theatre, 1913, which has produced hundreds of plays old and new. Provided the ana nonductions Provided the ana. productions at the Malvern Summer Festivals, 1929- in remoter parts of Central Africa.

37. A Governor of the Old Vic, Sadler's Wells and of Stratford Festival Theore; awarded Gold Medal of the Birmingham Civic Society, 1922. Pubs.: Fificila (with Basil Dean), 1911; The Christmas Party, 1913; The Marriage of Figaro (new adaptation), 1926; Demos, King and Slave (adaptation) 1931. Knighted, 1925. See T. C. Kemp, The Burmingham Repertory Theatre; The Playhouse and the Man, 1913, 1918.

1913, 1918.

Jackson, Sir Francis Stanley (1870-Jackson, Sir Francis Stanley (1870-1917). Eng. politician, governor and cricketer, younger son of the first Lord Allerton, one-time (bief secretary for Ireland. Educated at Harrow and Cambridge Univ. He had a distinguished parl career, entering Furlament in 1915 as Conservative member for the Howden. as Conservative memor for the interest shire Div. of Yorkshire and reaching the chairmanship of the Unionist Party organisation in 1923. Was governor of Rengal, at the time of the Montagu-Cheimsford constitution, in 1927–32 during the height of the terrorist menace. but when he was succeeded by Sir John Anderson the difficult political situation had been mitigated by his firmness and courage. But it is as a cricketer that he will be best remembered. He was in the will be best remembered. He was in the Cambridge eleven (captain, 1892-93), captain of the Yorkshire eleven, succeeding Lord Hawke as president of Yorkshire Cricket Club; and repeatedly played for Gentlemen v. Players and All-England test teams. Other activities prevented him from ever going to Australia, but his record against Australia in test matches in England more than anything revealed his talents as an all-round player of the in England more than anything revealed in talents as an all-round player of the first class. In all be played in twenty test matches, making 1412 runs with an average of 48 runs per limings. Yorkshire was champion oo, during his epoch in 1946, 1895, 1909, 1901-2 and 1905. In trentemen v. Players matches at Lords, I played 18 innings for an average of 34. J played 18 innings for an average of 34. In 1904, when he and S. M. J. Woods of comersotalize bowled unchanged, the Players were dismissed twice, for 103 and 107, J. taking 12 wickets for 77 runs, the best performance of his cricketing career. has performance of his cracketing career. Against Australia at Leeds he took 9 wickets for 42 runs. As a 'atsman of the quick-footed type he had no superior, but above all he supplemented his gifts of defence and clean hitting with a temperament admirably suited to any situation; and when he retired from first-class cricket often 1905 he was admired by some as after 1905 he was adjudged by some as perhaps the greatest crucketer in England.

Jackson, Frederick George (1860–1938),
Brit. explorer. For some months he

travelled in Australian deserts; and in 1893 he journeyed on a sledge in mid-winter across the foren 'tundra' of 'bleria, which lies letween the Ob and the Perhora. The Great Frozen Land (1895) i- the narrative of his adventures on this occasion; and in the same way A Thousand Days in the Arcic (1899) gives the results of the Jackson-Harusworth Polar Expedition to Franz Josef Land, which he commanded. Crossed Africa Beira to Banana Pt., 1925–26, and made journeys in remover parts of Central Africa.

Jackson, Helen Maria (1831–85), Amer. authoress, was the daughter of a prof. at Amherst College, Massachusetts. Emerson expressed his admiration for her meditative Verses, which were pub. in 1870. Her best work of fletion is Ramona (1881), which contains an admirable appreciation of Indian character and life. In A Century of Inshonour (1881) Miss J. Issued a spirited denunciation of the govs. dealings

with the natives.

Jackson, Holbrook (1874–1948), Eng. writer and bookman, b. at Liverpool, self-educated. He started earning a livelihood in commerce at the age of fitteen. He had however determined on a writer's He had however determined on a writer's career and entered journalism in 1907, becoming joint-editor with A. W. Orago of the New Age. He also contributed as a freelance writer to most of the leading periodicals of the day. In 1910 he was associated with T. P. O'Connor in the latter's pubs., and became editor of T.P.'s Weekly (1911-14). From 1917 to 1923 he was both owner and editor of a literary jour. To-Day. In addition to his interest in literature and book-collecting he was an literature and book-collecting he was an acknowledged authority on various business matters, and from 1917 until his death he was editorial director of the National Trade Press Ltd. He was also chairman of the Brit. Colour Council, 1933-34, having interested himself in cashions in colour and their introduction. The first pub hook was an essay on Ed. His first pub. book was an essay on Edward FitzGerald with a bibliography (1899). He was the first to write a full-(1899). He was the lift to write a full-length study of Bernard Shaw (1907) and also wrote a biography of Wm. Morris (1908). His book Eighleen Nineties (1913) is a standard work on the period. An authority on book production, he col-laborated in A Brief Surrey of Printing (1923) and was author of The Printing of Rocks (1939). (1923) and was author of The Printing of Books (1938). His wast knowledge, technical, literary, and antiquarian, his love and care of books were the resources out of which he wrote his Anatomy of Bibliomania (2 vols. 1930–31), a work modelled on Burton's Anatomy of Melancholy. His pub. vols. of essays include Southward Ho! pub. vols. of essays include Southward no (1914), Occasions (1922), Essays of To-day and Yesterday (1928), and Maxims of Books and Reading (1934). His Dramers of Dreams (1948) contains studies of a number of Eng. and Amer. writers of the

Jackson, John (1769-1845), Eng. pugilist, son of a London builder. Fought only ust, son or a London builder. Fought only three fights, defeating Fewterel, at Croydon, in 1788, in the presence of the Prince of Wales; defeated by Ingleston at Ingatestone, 1789, through breaking bones in a fall; defeated Mendoza at Hornchurch, 1795. Champion of England till retirement in 1803. Known as 'Gentleman Jarkson.'

man Jackson.

Jackson, Sir Thomas Graham (1835-1924), Eng. architect; b. at Hampstead; son of Hugh J., solicitor. At first intended to become painter; but entered Sig G. Gilbert Scott's office, 1858. Much of his work was restoration, and nearly all of it was devoted to scholastic or eccles. buildings. In Oxford he designed the new

Examination Schools, the new Radoliffe Library, and extensions to Brusenose, Corpus, and Balliol; in Cambridge, the Sedgwick Memorial Museum, the Law Library, and the Physiological Laboratory. He also designed new buildings for many public schools, including Eton, Rugby, and Harrow. Specimens of J.'s restorative skill may be seen in Great Malvern Priory, and in Winchester Cathedral (for which he received a baronetcy in 1913), and there is a new church of his at 1913), and there is a new church of his at Aldershot. R.A., 1896. Books include: Modern Gothic Architecture (1873), Reason in Architecture (1996), Gothic Architecture in France, England, and Italy (1915), The Renaissance of Roman Architecture (1921-

Jackson (Stonewall), or Jackson, Thomas Jonathan (1821-63), Amer. Confederate general, b. in Harrison co., Virginia. Of mixed Scottish and Irish descent, he was essentially the type of man who formed the essentially the type of man who formed the backbone of the people of the middle states of America. Educated at a small prov. school, he was severly handleapped when he entered W. Point Academy; but he overcame the limitations of his early schooling by pertinacity. He began his military career as an artillery licutenant, and won distinguished himself in the war grants the Mayleans carring in Moreans. against the Mexicans, serving in Mag-ruder's Battery and being breveted captain for his gallantry at Contreras and at Cherubusco (q.v.). But after this war he resigned his commission and took the post of prof. of military science and mathematics at the State Univ. of Virginia. His participation in the civil war is easily explained by his sturdy advocacy of State rights, involving the support of Virginia's slave laws and her right to secode from the Union. Hence, when the war broke out between the Federal and Confederate States, J. was given a command in the S. Army, and at once proved himself to be an efficient and enterprising officer. At an efficient and enterprising officer. At the battle of Bull Run he commanded a brigade, and the dour defence made by him and his troops earned him the celebrated sobriquet of 'Stonewall' (1861). In the course of the famous Shenandeah Valley campaign (1862) he succeeded in defeating the three Federal detachments under Banks, Frement, and McDowell, and later in inflicting a second defeat on and later in inflicting a second defeat on Banks at Cedar Run, near Culpeper, Vir-gula. During the Maryland campaign he obliged 11,000 Federals to surrender in Harper's Ferry and his corps at the tough Harper's Ferry and the corporation fight of Antietam rendered yeoman service to the embarrossed Lee. Fredericksburg to the embarrassed Lee. Fredericksburg and Chancellorsville (1803) were his last two battles. At the latter he was thrice wounded and shortly afterwards died. To his soldiers he was a very Napoleon, but with his rare gift for inspiring popularity was combined the intense religious fervour of Cromwell. Stonewall Jackson, The Good Soldier, by Alfan Tate, 1930, is a critical study of his generalship.

Pop. 6200.

Jackson, William (1730-1803), Eng. musical composer, studied music under the organist of Exeter Cathedral and later under Travers, then organist of the Chapel Royal, London. His Elegies and other part-songs, especially Time has not thinned my flowing hair, and the tender melodies in his opera, The Lord of the Manor (performed at Drury Lane in 1781),

still delight music lovers.

Jacksonville: ,1) Cap. of Duval co., Florida, U.S.A.. and situated on the St. John's R. This city, which is an important railway centre, is well built, possessing many large buildings, while its streets are wide and shaded with trees. It is also a resort for winter visitors, and an important trading place, exporting and importing very largely. It has a natural harbour with a 30 ft. channel at low tide. It has with a 30 ft. Channel at low tale. It has numerous factories, iron foundries, and engineering works. It is a seat of a Confederate Soldiers' Home, and a National Marine Hospital. Pop. 173,100. (2) The cap. of Morgan co., Illinois, U.S.A., stuated about 33 m. W. of Springtield. In this tn. are situated sev. culcational institutions, among them the Illinois College. stitutions, among them the Illinois College Cliesenting), the State Conservatory of Music, and Illinois College for Women (Mothodist). Pop. 19,800.

Jacmel, seaport of Huiti, situated on the S. coast, 30 m. S.W. of Port-au-Prince. The vessels here anchor about

half a mile away from the shore. Exports

Jacob, also called Israel, son of Isaac and Robekah. He was one of the three great Heb. patriarchs whose histories are recounted in the Book of Generis. His twelve sone are applied of a them. twelve some are spoken of as the ance-tor-of the twelve tribes. J.'s death took place in Egypt whence he was carried to Hebron for burial. Cheyne considers his name to be that 'not of an individual, but of the

imaginary ancestor of a tribe.

Jacob, Sir Claud William (1803–1948),
Brit. soldier, son of Major-Gen. Wn. J.,
educated at Sherborne School and R.M.C.,

Div. and was the only Indian army officer of the Corps to rise to high command there. of the Corps to rise to high command there. In 1915 he led the Dehra Dun Brigade at Neuve Chapelle and at Aubors Ridge. Commanded II Corps for the remainder of the war: during the Somme Battles, 1916, when he took Thiepval (2.v.) by a well-planned assault; at the Anore operations and the pursuit of the Gers. to the Hindenburg Line, 1917, and at the third battle of Ypres; and in Flanders in the flual Allied advance to victory in 1918. In 1920 he returned to India on his appointment as Chief of the general staff. In 1924 he was given the N. Command in India. From 1926 to 1930 he was military secretary at the India Office. In 1927 he was appointed Colonel of the Worcester-hire Regt. From 1916 to 1933 he was Colonel of the 1st/4th Hazara Pioneers, which body he had formed in 1904 for work on the N.W. Frontier communicawork on the N.W. Frontier communications. His last official post was Constable of the Tower of London, 1937-43. High as he rose, he narrowly missed reaching the highest positions on two occasions: the first was during the First World War when, as a Corps commander, he was seriously considered as successor to Haig as Commander-in-chief on the W. Front; and p. 1924 when the pest of Commander and in 1924 when the post of Commanderin-hief in India seemed likely to be offered to him, but the choice fell instead to Sir Wm. Birdwood. A soldier of much practical sense and high moral courage, with a great talent for commanding men.

Among his many decorations he had the Amer. Distinguished Service Medal.

Jacobadad, tn. of Upper Sindh, India. It is situated 45 m. N. W. of Shikarpur, and has cantonments. It obtained its name from Gen. John Jacob, its founder. Pop.

10.000.

Jacobean, term applied to architecture and furniture of the reigns of the Stuarts (1603-88), though strictly only to those of the time of James I. J. furniture is generally of heavy oak, skilfully carved. Panelling is characteristic of the interior

of the typical J. house.

Jacobi, Friedrich Heinrich (1743-1819), Ger. philosopher, b. at Dusseldorf, studied at Frankfort and Geneva. In 1807 he was made president of the Academy of Sciences at Munich, where he d. His philosophical work was not original in nature, but consisted in keen criticism of the systens promulgated by others. He was largely responsible for drawing attention to the philosophy of spinoza by his letters to Mendelsshon, Ceber die Lehre des Spinoza (1785), and compared Hune with Kant in his work Parid Hune über den Ulauben oder Lehre werd Perikanen. imaginary ancestor of a tribe.'
Jacob, Sir Claud William (1803–1948),

113 occuments were published. See studies by L Koenigsberger, 1901, and A Kowalewski, 1917.

Jacobina, tn in the state of Bahls, Brazil It is situated in a fertile though mountainous region and has a cotton-growing and cattle industry. Pop.

growing and cattle industry. rop. 10,000.

Jacobins, Fr. political society formed during the Fr. Revolution, of persons who aimed at constitutional reform of a reasonable kind. They were called J because they used to meet in a building in the rue St. Honoré, Paris, which belonged to the Dominican order, called in France to the Dominican order, called in France the Jacobin. Afterwards the member-grew more extremist and organised the reign of terror; but their power ended in 1794 with the execution of Robespierre The word 'jacobin' was used in Britain and in Europe generally for the holders of extreme political opinions, and it was to oheck such views that the Anti-Jacobin (q.v.) was launched.

Jacobites, name given to the followers of the Stuart house after the revolution of 1688. The name is derived from the Lat. name Jacobus (James). James II had numerous followers in all the countries had numerous followers in all the countries of the Brit. Isles, but the later Stuarts, the Old and Young Pretenders, revewed their main support from the Scots. In 1689 Graham of Claverhouse roused the Highlands for James, Jought the battle of Killiecrankye, but died in the moment of victory. The Highlands were peaceful with the peace of desolation, after the massacre of Glenooe. In Ireland the Boyne had been fought in 1696 and the Irish defeated (see James III.) and Ireland also had been rought in 150 wind the first defeated (see James II.), and treland also was pacified at the edg of the sword Ireland, however, was so thoroughly subdued that during the two santsequent rebellions she pisyed no active part. The reign of Anne was one of constant intrigue reign of Anne was one of constant intrigue between the leading statesmen and the Old Pretender, and the Jacobite plot at the end of the reign failed only because of the too sudden death of the queen. In 1715, the Hanoverians having just been estab, on the throne, a Jacobite rebellion took place both in Scotland and in the N. of England. The indecisive battle of Sheriffmur, the surrender at Preston, and the somewhat depressing presence of the Old Pretender, all contributed to the overthrow of the rebellion. The prisoners taken were treated leniently, and the rebellion died a natural death. The attention of the present of the contributed to the contribute of the contributed to the contribute of the research died a natural death. The strengts to rouse opposition to the Hanoverlans by Alberoui met with no success, and it was not until the middle of the War of the Austrian Succession that the Young Pretender, 'Bonnie Prince Charlie,' landed

at Moldart with seven followers. He roused the Highlands at once, be swept roused the Highlands at Ouce, he swept away opposition at Prestonpans, and pro-claimed his father James III. He invaded England and reached Derby, but there he commenced to fall back. His march had been conducted in a great are over some 500 m. from Moidart to the outskirts of Derby, where the decision to turn back was taken at a point only 130 m. short of London. A rehellion on the defentive is London. A rebellion on the defensive is of a necessity a failure, and Charles was inally overwhelmed at Culloden. After numerous adventures he managed to escape, and died on the Continent, a weak, broken, dissolute drunkard. His younger brother became a cardinal of the Rom. Church, and thus ended the Stuart line. Every great statesman of the time had intrigued with the Stuarts, from Sunderland and Marlborough down to Newcastle hunself. In fact, when Charles reached Derby in 1746, Newcastle was undecided whether to declare for him or not. Many of the great names of the time can be written down as J, amongst them

can be written down as J, amongst them being Sanotoft. Harley, Bolingbroke, Atterbury, and later, Samuel Johnson. See Sit C. Petrie, The Jacobte Movement: First Phase, 1683-1716, 1949

Jacobs, William Wymark (1863-1943), Eng author, b. in Wapping, E. Loudon, son of Win. Gage J, a wharf manager and, thus early familiar with the types of long-shore man and sailors whose ullocynomeses shoreman and sailors whose idiosyncrasies he exploited with much success in his humorous stories. Educated at private schools, in the Savings Bank dept. of the Civil Service 1883-99 His earliest literary work was pub in the litter and Today both edited by Jerome K. Jerome, who soon recognised the merit of J's humour. Contributed to the Strand Magazine. His first vol of short stories, Vany Carpoes, was pub. in 1896. This success was followed by The Skipper's Woong (1897) and after Sea Urchins (1893) he abandoned the ('vil Service and thereafter lived entirely by his pen. J. pub about twenty vols, chiefly collections of short stories, vols, (hiefly collections of short stories, under such titles as Light Freights (1901), if Summeh Port (1902), The Lady of the Barge (1902), Odd Craft (1903), Dialstone Lane (1904), Captains All (1905), Short Cruises (1907), Sullhaven (1908), Saslore Knots (1909), Ships Company (1911), Night Wulches (1914), The Castaways (1918), Deep Waters (1919), and Sea Whispers (1926) He also wrote some oneact plays, such as Eshabishing Relations and Diron's Return. His gruesome story The Monkey's Paw marked a departure from his humorous veln; this story and some others were dramatised in collaborasome others were dramptised in collabora-tion with Louis N. Parker and successfully

played. He also collaborated in Beauty and the Barge, a three-act comedy (1906). Jacobsdal, div. of the Orange Free State, S. Africa, and the cap, of that div., situated 25 m. S. of Kimberley. Sev. engagements occurred here during the Boer war

(1839-1902). European pop. 400.

Jacobsen, Jens Peter (1847-85), Dan.
novelist, b. at Thisted, Jutland. He began as a student of botany and later trans.
Darwin into Dan. Among his works are

Marie Grubbe (1876), Niels Lyhne (1880), and a vol. of stories called Mogens (1872). Jacob's Ladder, or Polemonium corru-leum, a species of Polemoniacese found in temperate climates and of rare occurrence temperate climates and of rare occurrence in Britain. It is a perennial herb which attains a height of 1 to 2 ft. and bears blue or white flowers. The popular name is given to the plant because of the ladder-like arrangement of the leaves.

JACOB'S LADDER

Jacobstadt, or Jakabpils, tn. on the R Dwina 7 m S.E. of Riga, Estonia Fighting took place here in Sept. 1915. when the Gers were endeavouring to break through to Moscow. They achieved some success with a large force of cavalry. but a Russian counter-attack restored the position. Further ighting took place here in March 1916, when the Russian-took the offensive. In Sept. 1917, the Gers, crossed the Dwina just above J., and compelled the Russians to concentrate on that place. The Bolshevik Revolution brought lighting to a standstill. Taken by the Gers, in the Second World War, the Russeus drove them out again in

Aug. 1944.

Jacobus, gold com struck in the reign of James 1. of Fingland (1603-25), and thus named after him, J being the Lat. equiva-lent for 'James' It was of the same value as twenty-five shillings sterling, but was put out of coinage at the conclusion of that

reign. Jacopone Jacopone da Todi (1240-1306), It religious poot, b at Todi in the duchy of Spoleto. He was originally an advocate, but about 1268 turned a Franciscan, and wrote poems which display an extreme bent towards asceticism. He is an author bent towards asceticism. He is an author of the 'laude,' which play an important of the laude, which pay an important part in the development of it, drama from 1393 to 1303, Todi was imprisoned for inveigning against and satirising Pape Boniface VIII., and siding with the Colonnas in their struggles against the Pope. On the death of Boniface he was released, when it is not the particular for five years in a dim-

has been ascribed to Todi, as also many beautiful Lat. hymns. An ed. of his works appeared at Florence in 1990. See

works appeared at Florence in 1490. See lives by A. D'Ancons, 1884 and Evelyn Underhill, 1919.

Jacotot, Jean Joseph (1770–1840), Fr. educationist and inventor of the 'universal method' of education, 5. at Dijon. He became successively soldier, military secretary, and holder of various professorial chairs. It was while at Louvain that he applied his method of 'universal instruction,' closely resembling that of Hamilton. The principle of his system is that the The principle of his system is that the mental capacities of all men are equal, and

mental capacities of all men are equal, and he expounded his views in *Enseignement Universet* (1823). See the life by Guillard, 1860, and J. Tourrier's Intellectual Emancipation. A Treatise on Jacobot's Method of Universal Instruction, 1852.

Jacquard, Joseph Marie (1752-1834), hr rechanician, b. at Ouillons, near Lyons. He invented the silk-weaving loom called after him (1801-03), a mechanical contrivance capable of being adjusted to any kind of loom, and doing away with the guidance by hand. The silk weavers offered violent opposition to silk weavers offered violent opposition to his machine, and he narrowly escaped with in life on one occasion. His invention, however, revolutionsed the art of weaving, and at his death his machine was in almost universal use. Napoleon rewarded him with a small pension.

Jacquerie, name given to a revolt of peasants in 1358, the designation Fr peasants in 1358, the designation and manding from the contemptuous term is questioned by which the nobles described the peasants. Long continued oppression on the part of the nobles was the cause of the rebellion, which broke out in the neighbourhood of the Marne and Oise. Charles of Navarre led the nobles, and Meaux the peasant army, the latter being defeated with great slaughter on June 29, 1358; thus ended the insurrection. the insurrection.

Jacitation (Lat. jacitator, boaster)
The suit causa factitationis matrimonis
may be brought against one who malicto the petitioner. The object of the remedy is to enjoin properties allence upon rement is to enjoin properties stence upon that matter against the jactitator, and apparently this suit is the only remedy available for such an injury. It is a remedy inherited by the Probate, Divorce, and Admiralty div. of the High Court from the old eccles, jurisdiction of the spiritual courts, and the statute conferring that purisdiction in the Divorce Court is the Matrimonial Causes Art, 1857. Suits of J. are extremely rare, probably because the remedy is not adapted, or because the events there are no piecedeuts to show that it is adapted to establishing the validity of it is adapted to establishing the validity of the potitioner's muriage with a third per-son. There is, however, a statutory remedy under the Legatimacy Declaration Act, 1858, for that purpose which is also the appropriate remedy to estab. the

legitimacy of offspring.

Jadar (or Yadar), riv. of Yugoslavia, just S.W. of Belgrade. It was the scene after languishing for five years in a dun-geon. The authorship of the Stabet Mater of a brilliant Serbian victory over the Austrians on Aug. 20-22, 1914. The battle was fought almost simultaneously with that of Shabatz (Aug. 17), the Serbs, under their crown prince, fighting the two battles in order to prevent two huge Austrian invading armies of 200,000 men in all, which were converging from N. and W. on the military dept. at Valievo, from effecting a junction and so 'squeezing out' the whole Serb army. In this the Serbs were entirely successful, winning first the battle of Shabatz and then that of the Jadar R., their casualites being about half those of the Austrians, who lost in the two defeats some 40,000 in killed, wounded, and prisoners, besides stores, and in addition being compelled to abandon the invasion.

vasion.

Jade, ornamental stone, generally of green colour, belonging to two distinct species, viz. Jadete and nephrite, often wrongly confounded one with the other. Jadete belongs to the pyroxene group, while nephrite is a variety of amphibolo. J. is highly prized in the E., especially by the Chinese, and is found in China, Burma, and many parts of S. Asia. It was used by the prehistoric peoples of Mexico, Alaska, New Zealand, and other countries, for utensils and carvings, and on many prehistoric sites in Europe, as in the Swisslake dwellings, J. objects have been frequently discovered. Consult Dr. G. F. Kunz, (ed.), Investigations and Studies in Jade, 1906, for a full and exhastive description of the stone; also S. C. Nott.

Chinese Jade, 1936.

Jadeite, mineral species related to the pyroxenes and differing markedly from true jade or nephrite. It is a monoclinic aluminium sodium silicate, White or 'camphor' jade is the purest form, though usually specimens are coloured by the presence of metallic oxides, e.g. chromium causes brilliant green patches. Though the hardness of J. differs but little from that of jade, its sp. gr. is much higher (3.20 to 3 tl). It is much more readily tusible. Although implements of J. have been found on many prehistoric sites in Europe, it is only recently that the raw material has been found in situ on this continent, viz. in the Alps. Large stores of it have been mined since remote times in S. Asia. etc.

S. Asia, etc.

Jael, Jewish matron, wife of Heber, the
Kenite (Judges iv.), who, after the battle
on the Kishon, treacherously slew Sisera
who, at her invitation, had taken refuge
in her tent.

Jaen (1) Prov. of S. Spain, and one of the most fertile dista., being well watered by the Gnadalquivir, Segura, and other riva. It produces wine, oil, cereals, etc., and has lead mines. It was conquered by the Moore on their entrance into Spain and in 1246 fell into the hands of Ferdinand III. of Castile. Area 5200 sq. m. Pop. 809,400. (2) The cap. of the prov., situated on a trib, of the Guadalquivir, 50 m. N.W. of Granada, and 122 m. E.N.E. of Seville. It consists of an old and now the former having remains of a Moorish wall flanked with towers, and irregular, winding streets. The cathedral, on the site of a mosque, is of special interest, and

there are sev. handsome churches. Weaving and milling industries are carried on, but the silk, for which it was at one time famous, is no longer manufactured. Pop. 55.100.

Jafarabad, feudatory state in India in the prov. of Kathlawar. The chief tn. is Jafarabad, 28 m. E.N.E. of Diu, on the estuary of the R. Ranai. Pop. about 5000.

Ja'far Pasha-el-Askeri (1880-1936), Iraqi statesman, b. at Bagdad. Educated: Constantuople and Germany. Entered Turkish army, 1902. Promoted captain in Balkan War, 1912. In the First World War he was chosen to organise the troops of the Sheikh-el-Senussi; and, attempting to invade Egypt, was captured by the Dorset Yeomanry at Agagia. Feb. 26, 1916. In an attempt to oscape from Cairo citadel he injured himself; and, during incapacitation, he was converted by the reading) to the Brit, side. Joined Hejaz army, 1917, and was given the C. V. G. on the recommendation of Gen. Allenby. Governor of Aleppo, 1919. Minister of Defence in Iraq, 1920-22, and represented Iraq at Lausanne conference. Prime Minister, Iraq, 1923; diplomatic agent in London, 1925 26. Prime Minister and minister of foreign affairs, 1926-28. Minister in England, 1923-30 and also 1932-31, and called to the Eng. Bar. Iraqi Senator, 1934. Minister of Defence, 1935. Assassinated after a curp d'état in Oct. 1936.

Jaffa (anct. Japho; Ck. Joppa), second largest th. in Palestine, its pop., is estimated at 70,000. It is 5 im. by rall from Jerusalem, of which it was the port in King Pavid's time. The old parts of the th. stand on a rock dominating the harbour. J. is the headquarters of the S. dist. and the port of Jerusalem. J. was known in the time of the Crusades as Japhe, and has a long hist, both recorded and legendary. It was the reputed scene of the rescue of Andromeda by Perseus and also of the awallowing of Jonah by the whale. Its name is to be found on the tower of Thotmes II at Karnak among the cities mentioned as being overwhelmed by Pharach. Later it became a Phemician city, and then, for a thousand years, Philistine, during which time the logs for Solomon's Temple, after being floated down from the ports of Lebanon by Hiram, were landed. Under the Maccabess, J. became essentially Jewish. Then Pompey conquered it, and, having made of it a Rom. free city, gave it to Cleopatra as a love token. It afterwards became a pawn in the conflicts between the Rom. and Idunean rulers. It was in the house of Simon the Tanner in J that St. Peter saw the vision recorded in the Actaix. 43. In the Crusades, Baldwin I. signed the treaty of Jaffa with the Genoese, whonce sprang much strife. The city then became a co.; but in 1187 it was captured and destroyed by the brother of Saladin, and then retaken by Richard Cour de Lion. In 1287 it was sagain sacked, this time by Bibars, and in 1799 it was stormed by Napoleon. The strike over Jewish inmigration, formented by the Arab political leaders,

which developed into grave disorders throughout Palestine in 1936, began in J. Though of such antiquity, J. is uninteresting to the visitor. Its streets are narrow and tortuous. N. of the old city is Tel Aviv, the cap. of the state of Israel considerably enlarged through the spur of Zionist development under the Brit. Zionist development under the Brit. mandatory regime and, in contrast to Jaffa itself, strikingly modern. Oranges from inland are the chief export. There is rail connection with Jerusalem, Kantara, and Haifa over two lines, the junction of which is at Lydda. The port consists of a Customs House and jetty, and a short wharf where lighters land cargoes in smooth water.

Jaffna, or Jaffnapatam, scaport tn. on Jaffna, ls. off the N. coast of Ceylon, 116 m. from Trincomali. It has a ruined Dutch fort, an old Dutch church, and temples. Palinyra timber, tobacco, truit, rice, and curry-stuffs are yielded, and the Tamils also carry on fishing. Pop.

45,000.

Jagadhri, tn. of Amhala dist., Punjah, India, with manufs. of 170n and copper, and a borax refinery. Pop. 12,000. Jagdalak, sec. JUDDALAK.

Jagellans, or Jagellenes, royal dynasty of Poland, descended from Gedinin of Lithuania (d. 1312), founded by Jagellenes (c. 1315-131), afterwards Ladislaus II. This illustrious line ruled in Poland from 1802 (172), then with bildgranud August. 1386-1572, when, with Sigismund Augustus, the male line became extinct. Through his sister's descendants the J. continued on the throne till 1668. Rulers over Lithuania, Hungary, and Bohemia, were also chosen from the J.

Jagannath, see PURI.

Jagersfontein, vil. of Fauresmith div., Orange Free State, S. Africa, 67 m. W.S.W. of Bloemfontein. The celebrated Klipfontein diamond mines nearby rank next to those of Kimberley. J. is on the railway from Cape Town to Pretoria.

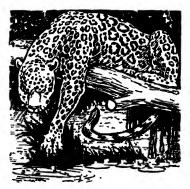

railway from Cape Town to Pretoria. Pop. 4500.

Jagger, Charles Sargeant (1885–1935). Eng. sculptor, b. near Sheffield. He trained at Sheffield School of Art and at the Royal College of Art, S. Kensington, where he went on a scholarship. Here he won a travelling scholarship and visited Rome and Venice. In 1914 he won the Rome Scholarship for Sculpture of the Brit. School at Rome. His best known work is the Royal Artillery Memorial Brtt. School at Rome. His best known work is the Royal Artillery Memorial Hyde Park Corner, London, but is not his best work, being a compromise through collaboration with architects and an organising committee. His most characteristic work is in the manuer of the bronze gunners at the sides of this Memorial, the figure on the G.W.R. War Memorial and that of Sir Ernest Shackleton on the building of the Royal Geographical on the building of the Royal Geographical Society. Elected an associate of the Royal Academy, 1926, and a member of the Royal Mint Advisory Committee on Coins, Medal, etc. in 1932. His group in stone for Imperial Chemicals House, Mill-bank, won him, in 1935, the gold medal of the Royal Society of Brit. Sculptors.

Jaggery (Hindustani shakkar), coarse brown sugar of the East Indies, chemically the same as cane-sugar. It is made by inspissation from the sap of various palms, such as the J., coconut, Palmyra, and datepalms (Phanix dactylifera). The Indian palms (Phonix dactylifera). The Indian Phonix sylvestris and Caryota urens also yield J., as do also the Nipa fruircaus, Arenga saccharifera, and others. The sap or juice by fermentation becomes palmwine, from which arrack is distilled.

Jago, Richard (1715-81), Eng. clergy-man and poet, studied at Oxford. He held various livings in Warwickshire from 1746, various livings in Warwickshire from 1748, dying at 'nitterfield. His Poems, Moral and Descriptive were pub. by Hylton in 1754. Among them are: 'The Hackbirds,'; 'Edgehill' or, the Rural Prospect delineated and moralised'; 'Labour and Genius, a Fable.' See W. Shenstone, Works in Verse and Prose, iii., 1777; A. Chalmers, Works of the English Poets, vii., 1810; F. L. Colvile, Worthes of Warwickshire, 1869; and C. H. Poole, ii arwickshire Poets, 1914
Jagst, or Jaxt, dist. and riv. of Württemberg-Haden, Germany. The dist. has an area of 2000 sq m and a pop. of over 400,000. Chief tn., Ellwangen. The riv. is a trib, of the Neckar.
Jaguar (Felis onca), large Amer, spotted cat of the order Felidæ, found in countries

cat of the order Felide, found in countries ranging from Texas through Central and S. America to Patagonia. In form the J

JAGUAR

somewhat resembles the leopard, but is of new and resembles the state of a lion or tiger. Its skull resembles that of a lion or tiger. Its movements are rapid and it is very agile. It has a tawny yellow hide, spotted with block, and varies in length from i ft. to 6 ft. 9 in. It is tes in length from 1 it. to 5 it. 3 in. It is generally found singly, and preys upon quadrupeds, such as horses, dogs, and cuttle. It emits terrific roars and cries, particularly during the mating season. From two to four cubs are produced at birth towards the close of the year. In disposition the J. is ferocious and blood-thirsty and offer having teated human. thirsty, and after having tasted human

flesh, it occasionally becomes a confirmed man-seter. It submits somewhat grudgingly to captivity, but may become subdued and even dodle. It is usually subdued and even dodie. It is usually bunted with dogs and polsoned arrows, though sometimes with the lasso, and the skins are imported into Europe in large numbers. The black-furred J. is some-times regarded as a different species, but the characteristic markings can be detected in cortain lights. Amer. naturalists divide the species into a number of forms regarded as distinct, but preferably ranked as sub-species.

Jahangir, Mogul emperor of India, succeeded his father, Akhbar, in 1605 and reigned till his death in 1627. When he ascended the throne his son, Khusru tried to usurp power and to seize Lahore, whither J. had transferred the seat of gov. Insurrections marked his reign through-out. J. was strongly influenced by his favourite wife, Nur Mahal ('Light of the Harem'), and the currency was struck in her name, and court intrigues occupied her life. J. favoured the Jesuit missionaries, whose influence was ovident in many seventeenth century buildings in Lahore. The Saman Burj and other parts of the old royal palace and various tombs date from J.'s reign. It was in his time that the Eng. first estab. themselves at Surat the Eng. first estab. themselves at Surat and appointed their first embassy to an Indian court. J. was succeeded by his son, Shah Jahan, the founder of Delhi, which city was known to Moslems as Jahanabad. In Jahan's reign the Mogul empire reached the peak of its magnificence. But his chief city of residence was Agra and his name will ever be associated with the glory of Indian architecture, the Taj Mahal, named after his wife, Muntaz Mahal, hesde whom he lies hurden.

Mahál, beside whom he lies buried.

Jahn, Friedrich Ludwig (1778-1852), father of gymnastics, or Turnvater, b. at Lanz in Prussia. First served in the Prussian army, and in 1811 started the first gymnasium in Berlin. His system did graph for neutre purieds the market production and the system as the system as the system and the system as th first gymnasium in Berlin. His system did much to revive patriotism and attracted the Prussian youth, but in 1818 his gymnasia were closed on account of the political gatherings held there, which were of too liberal a nature to find favour in the eyes of the Prussian Gov. J. was arrested and imprisoned for six years

was arrested and imprisoned for six years (1819-25) as a demagogue. He wrote Deutsche Volkstum (1810) and Die deutsche Turnkunst (1816). See E. Nevendorff, Turnouter Jahn, sein Leben und Werk, 1928 and F. Eckhard, Friedrich Ludwig Jahn: Eine Wurtigung seines Lebens und Wirkens (2nd ed.) 1931.

Jahn, Otto (1813-69), Ger. archeologist and classical editor, b. at Kiel. In 1839 he was appointed to the chair of archeology at Leipzig, where he founded the Archeological Society. His pubs. include works on Gk. art, representations of anot. life on vases, a masterly life of Mozart, and essays on music. His letters were ed. by A. Michaelis, 1913.

Jahrum, th. and dist. of Fars prov.

Jahrum, ta. and dist. of Fars prov., Persia, 90 m. from Shiraz. The dist is famous for its shahan dates, other fruits and tobacco being also exported. Pop. 15,000.

Jahvist (J), or Yahwist, worshipper of Jahveh or Yahweh. The term is now generally applied to the writor or writers of the non-Deuteronomic portions of the of the hon-betteround portions of the hexacouch, marked by the use of Jahveh, or Jehovah (the 'sacred tetragrammaton' of JIVH or IHUH), not Elohim, as the name of God. A Jehovist (JE) is properly one who combined the work of Jahvists and Elohists (E).

Jail Fever is now recognised as a severe rm of typhus fever (y,v_*) . The disease Jahl rever is now recognised as a severe form of typhus fover (q, n). The disease raged in Eng. prisons from the sixteenth century breaking out at the Black Assize of Oxford in 1577. It was caught by many attending the assizes at the Old Bailey as late as 1750, but owing to the improvements in sanitation is now of rare excursions. See 1. Howard, Account of occurrence. See J. Howard, Account of the State of Prisons, 1777. Jainism, doctrine of the Jains, a wealthy

and influential Hindu sect, mostly found in the W. dista. of Upper India. It is allied in many respects to Buddhism, but appears to have developed from Brahmanism at an earlier date than Buddhism dld. Its origin is attributed to Vardhamana Mahavira, who lived about the end of the sixth century B.C. The sect flourished sixth century B.C. The sect flourished greatly between the third and eighth centuries, but subsequently dwindled ow-ing to persecution by the Brahmins. In 1901 the number was given as 1,335,000. 1901 the number was given as 1,335,000. The Jains, like the Buddhists, deny the divine origin of the Veda. They believe in the separate existence of the soul after death, even of animals, and this belief leads them to take great care of animal life. They brush seats before sitting, and trink only water that has been strained, never leaving it uncovered for fear that some insect may be drowned in it. They have to practice liberality nietr. greatly have to practise liberality, piety, gentleness, and penance, and must make a daily visit to the Jain temple. Their principle is to suppress the body by abstinence, continence, and silence. During certain seasons they abstain from honey, grapes, fruits, salt, tobacco, and other articles. The members of the religious order of the Jains are called Yatis, those of the secular order Sravakas, the rules for the former being stricter than those for the latter. The Jains are not divided into castes, except in S. India, but they have certain family groups between which marriage is not ollowed. Formerly they advocated leaving the body naked, but this practice is now confined to meal times. Their creed is very detailed, and in many respects fantastic. They reverence defied saints called Jina, who give the sect its name. These saints are eventy-two in number, twenty-four each of the past, present, and future ages respectively, the earlier of them being of gigantic proportions who lived enormous lengths of time, while the most recent resemble ordinary humans in these respects. The J. are responsible for many beautiful temples, notably Mount Abu and Mount Parasnath. Their temples are usually constructed The Jains are not divided into castes, ex-Their temples are usually constructed with pseudo-urch and dome, built in hori-

zontal courses and with pointed section.

Jainism Hills, mountainous dist. form-large of Katoch (fourth century kingdom of Katoch (fourth century)

Jaintia Hills, mountainous dist. forming with Khasi a dist. of Assam, India. It lies S. of Brahmaputra valley, E. of the Khasi Hills. Area about 2000 sq. m. The inhab. call themselves Panars, but are known as Santengs (Syntenga) by the Khasis. Coal and Imostone are found,

and rice is grown.

Jaipur, or Jeypore: (1) State of Raj-putana, India, covering an area of 15,579 tq. m. The central portion is a sandy tableland about 1500 ft. above sca-level, but in the N.W. the surface is broken by a but in the N.W. the surface is broken by a spur of the Arwalli Mts. J. came under Brit. protection in 1818, and 19 one of the wealthiest and bost administered of Indian states. The ruler is the head of the Kachhwaha clan of Rajputs. J acceded to India u. 1947. The minerals found are copier, cobait, and hon, and large quantities of salt abound. Pop. 3,040,000. (2) (ap. of above state, 850 m. N.W. of Calcutta, and 84 m. N.W. of Ajmeer. It is a walled city, well built, with the inaharajah's balace in the centre, and is the chief commorcial centre of Rajputana. Building of note are a orner, and is the chief commortal centre of Rajputana. Buildings of note are a college school of art, industrial and eco-nomic museum, observatory, mint, hos-pital, and sev. mosques and temples. Fabrics, enamelled gold-wares, and marble sculptures are the prin. manuts. Pop. 145,000.

146,000.

Jaisaimir, Jaisaimer, or Jessulmir, one of the Rajunt states of India. Situated in the great Indian desert, in the W. of Rajuntana, it is about 15,000 sq. m. in area. The tin., cap. of the fondatory state, was founded in 1156 by Rawal Jaisai, and is 136 m. from Sukkar. There is a strong fact on the bill with many lain temples. fort on the hill with many Jain temples. Trade in wool, camels, sheep, and cattle is carried on. Pop. of state 70,000; tn.

5000.

Jaice, anct. tn. of Bosnia, on a hill near the junction of the Pliva and Vrbas riva.
The tn. possesses an interesting four-teenth century citadel and a ruined church (fifteenth century), the legendary burial-place of St. Luke. Pop. about 4000.

Jajpur, or Jajpore, th. of Bengal, India, 43 m. from Cuttack. It is a place of pil-grimage. Pop. 11,000 (mostly Hindus). Jakutak, see YAKUTSK. Jalalabad, or Jelalabad, th. of Afghanis-tan, on the route between Kabul and

tan, on the route between Kapul and Peshawar, in a fertile plain near Kabul R., close to Khaibar Pass. It is noted for the brave resistance made by the Brit, under Sale (1841-42) to the Afghans. Its de-destroyed on the Brit. fences were destroyed on the Brit. evacuation of Afghanistan, 1842. Pop.

N.W. of Lahore, noted for shawis. Pop. 12,006. (2) Ruined in. of Jehlam (Jiehum) dist., W. Punjab, Pakistan, 68 m. S.S.E. of Rawalpindi. It is identified by Cunningham with Alexander's Bucephala, built in memory of his famous horse.

Jalandhar, Jullunder, or Jullundur, in. and cantonment of the E. Punjab, India, cap. of Jalandhar dist., 47 m. E.S.E. of Amritaar. It is mentioned in the Mahabharaia, and was once cap. of the Raiput kingdom of Katoch (fourth century B.O.). Pop 75,000 (Moslems).

Jalap, well-known purgative medicine.

Jalap, well-known purgative medicine, consisting of the dried root of *Iromosa purga*, a plant belonging to the Convolus family. It is a native of the E. slopes of the Mexican sierras, growing at an all things of them 1000 # and is arrest altitude of about 6000 ft., and is named from the tn. of Jalapa. Jalap-root confrom the ta. of Jalaps. Jalap-root contains starch, sugar, lignin, etc., but the active principle is a resin present to the extent of 10 per cent., which may be extracted with alcohol. J., which is administered either as a powder or in alcoholic solution. coholic solution, acts as a hydragogue eathurtic, and is used in constipation, reual disease, dropsy, and corebral affec-tions. The ordinary dose of the powder is

tions. The ordinary dose of the powder is from 10 to 30 grains.

Jalapa: (1) Dept. of Guatomala, Central America. Cap. Jalapa. Chief productions are coffee, the sugar-cane, rice, and maize. Pop. 75,100. (2) Tn. in Mexico in the state of Vera Cruz, of which it is the cap., 60 m. by rall N.W. of Vera Cruz city. It is 4330 ft. above sea level and is situated in a picturesque and fertile dist. with a healthy and temperate level and is situated in a picturesque and fertile dist, with a healthy and temperate chinate. The medicinal plant 'jalap' here grows wild. J. is famed for the wide overhanging eaves of its white colonial homes and other buildings, and its redicted roofs showing picturesquely against the semi-tropic verdure. The cathedral is a massive structure, with strange low-placed cupolas and with floors which slope slightly towards the altar. The church of the Beaterio was originally a franciscan convent: its huidings have Franciscan convent; its buildings have been renovated and modernised. Another notable church is that of St. Joseph. The Gov. Building or Palacio de Gobierno, The Gov. Building or Palacio de Gobierno, is a long, white editice of colonial type with pillars and archways on the first floor. Pasco del Ayuntaniento (q.v.) is a fine broad paved street leading to the Parque Juarèz, with its stairways and tall trees. There are other streets called by such names as Street of Jesus Helps You, Street of the Virgin, Street of John the Carbon Burner, Street of the Devil's Pocket, and Street of the Beilringer. Pop. 47,000.

47,000.

Jalaun, tn. of the United Provs., India, 68 nr. W.S.W. of Campore. The surrounding swamps cause cholera and malarial fever. Grain, oil-seeds, and cotton are exported. Pop. 8000 (largely

Hindus).

Jalisco, state of Mexico, on the Pacific, evacuation of Afghanistan, 1842. Pop. about 4000.

Jalabour, or Julaipur: (1) Th. of the W. volcanic cones, Colima (12,736 ft.), and Punjab, Pakistan, Gujarat dist., 78 m. Nevado (14,100 ft.), being the highest.

The chief riv. is the Rio Grande de Santiago, flowing out of Lake Chapala, and draining the N. portion of the state. The chief industries are gold, silver, and copper mining, and agriculture. Cotton and woollen goods, paper and tobacco are manufactured. Guadalajara (q.v.) is the

Jaina, tn. in the state of Hyderabad, India, about 215 m. from Bombay. J. has ceased to be a cantonment since 1903.

has ceased to be a cantonment since 1903, It is famous for its gardens, which grow large quantities of fruit. Pop. 18,000.

Jalpaiguri, Jalpigori, or Julpigoree, tn. and dist. of India. The tn. 19 on the R. Tista, about 300 m. from Caloutta. Pop. about 10,000. The dist. includes the W. Duars, and is situated S. of Darjeeling and Bhutan, and N. of Cooch Behar. Area 2960 sq. m. The dist. produces jute and tea, and lime is quarried in the lower Bhutan Hills. Pop. nearly 1,000,000.

Jalpan, tn. in Mexico, Queretaro state, situated about 85 m. from Guanajuato. Pop. 2000.

Pop. 2000.

Jaluit, or Jalut, one of the Marshall Is.
in the Pacific. It is the administrative

centre of the group

Jam, name applied to the preserve formed from fruit boiled with an equal tormed from fruit boiled with an equal weight of sugar, which dissolves in the juice of the fruit as the latter is broken. The process of boiling sterilines the entire mixture, and causes the luice to develop the essential 'setting' properties due to the presence of 'pectin bodies' always present in ripe fruits. J., if carefully and well made, can be kept for sev. years, though the quality generally deteriorates after twelve or eighteen months, owing to the crystallisation of the sugar, etc. The time requisite for boiling J. varies accordtime requisite for boiling J. varies according to the nature of the fruit used. It may be anything from ten minutes to one or two hours. The heating process should be two nours. The nearing process should be carried on over a slow fire, in order not to do away with the aromatic and flavouring principles of the fruit. If the boiling is hurried, these are carried away by the steam, and for this reason home-made J is superior to commercial, the latter usually being boiled for a shorter period than the former. When J. is made from oranges or lemons and such fruits, it is termed 'marmalade.' The poel of these contains a large proportion of aromatic and flavouring matter, and towards the end of flavouring matter, and towards the end of the boiling process is added to the pro-serve in the form of shreds. In fruit jellies, the juce of the fruit only is used, not the pulp as well, this being removed by straining. It is then boiled with sugar until ready to 'jelly.' Fruits are 'pre-served' by covering with water in suitable of the pulp and begins to a bigh tenn ntensils and heating to a high temp., the vessels being closed while hot. In home-made preserves, the actual propor-tion of sugar averages about 20 per cent; in commercial, from 10 to 00 per cent. See also PRESERVING.

divided into three cos.: Cornwall in the W.; Surrey in the E., and Middlesex in the centro, each of which is divided into five pars. J. is traversed by a mt. range, running E. and W., which culminates in the Blue Mt. Peak (7423 ft.) in the E. region. From this ridge flow numerous rivs., which promote luxuriant vegetation, but, with the acception of the Black B. but, with the exception of the Black R., are useless for navigation. Black R, is named for Maggotty Falls and is navigable for 25 n. The Salt R., and the Cabaritta, are navigable for a few miles. Other are navigable for a few miles. Other notable rive, are the Rio Cobre and the Rio Minbo in the S., and the Rio Grande, Martha Brae, and Great Sp. R., in the N. Roaring R., with its beautiful falls in St. Ann's Par., and Rio Cobre, which empties into Kingston Harbour, are the most picturesque rivs. There are many ex-cellent harbours—Port Morant, Falmouth, old Harbour, Port Maria, etc., but the finest is Kingston in the S.E. It has a total area of about 16 sq. in., and a depth, over at least 7 sq. m., of from 7-10 fathoms. The harbour is protected by a long spit of sand called the Palisadoes 71 m. long, at the extremity of which is Port Royal. The soil is very rich and fer-tile. The climate of J. is, on the whole, wery healthy. By the coast it is warm (mean temp. 80° all the year), but the heat is lessened by cool breezes. The atmos-(mean temp, 80° all the year), but the heat is lessened by cool breezes. The atmosphere is very moist during the two rainy seasons in May and Oct. Inland and on the uplands the climate is delightfully mild. The is, is frequently visited by thunderstorms. Heavy rains and floods caused much damage in 1909 and 1910. There are many valuable thantations. There are many valuable plantations. The chief trees grown are mahogany, balata, cbony, coconut, palm, liguim-vitæ, logwood, and cacti. There is a flourishing trade in fruit, chiefly oranges. bananas, pineapples, mangoes, and grape-fruit. Very line coffee is cultivated, es-pecially in the dist. of the Bine Wis. Maize, Indian corn. Guinea grass, chinchona, tobacco, and ginger are among the products of the soil.

Industries .- In the old days sugar and rum were supreme, but in the early nineties of last century they were supplanted for the first time as the leading planted for the first time as the teating industries of J. by fruit, which has been steadily growing in importance since that time. The export of bananas has exceeded 25,000,000 bunches in a single year; the production of citrus fruit is also rapidly expanding, as also of cocount. nuts in recent years, however, the banana crops have been much diminished by leaf spot disease (see Banana). 1919 the dept. of agriculture produced a new anety of banana, which may super-sede both the Gros Michel, which is the world accepted banana, and the Lacatan. The strain out of which the new commercial banana is expected is immune from Panama disease and is resistant to leafspot. J. is famous for its rum, which is still re-Jamaica, largest is, in the Brit. W.

and dairying. There are about 73,000 ac. under bananas and 40,000 under sugarcane; 40,000 under coco-nuts, and 6000 under coffee (Ann. Report, 1938). Exports: coconuts, logwood, sugar, bananas. coffee, cocoa, ginger, cigars, oranges, and pimento. The prin. manufs. are rum, oils, mineral waters, and matches. There oils, mineral waters, and matches. There are cigar factories, distilleries, and breweries, etc. Trade in 1943 and 1944 aggregated between £11 million and £13 million. Total imports: 1943, £7,311,340: 1944, £8,974.683: 1945, £9,595,587. Total exports: 1948, £1,237,431: 1944, £4,479,630: 1945, £5,137,045. Imports from U.K.: 1943, £2,566,302: 1944, £1,325,783: 1945, £1,326,461: 1946, £2,451,671: 1947, £3,563,248. Exports to U.K.: 1943, £738,688: 1944, £917,455: 1945, £2,530,557. The large supply of cheap black and coloured labour, coupled with the steep fall in the world-price of with the steep fall in the world-price of sugar—which, as to W. Indian sugar, has to compete with beet-sugar—has resulted in lower wages and a reduced standard of living: and there were serious riots in 1938. These, following on riots in Trini-1938. These, following on riots in Trini-dad, led to the sending out of a Royal Commission, under Lord Moyne (later Secretary of State of the Colonies) to investigate W. Indian Colonies generally and to the organisation of a scheme of small holdings or allotments. Much has been accomplished already to improve conditions in J. by grants and loans under the Colonial Development and Welfare Act, 1940. The assistance approved by way of grant and loan to J. to Jan. 31. 1945 reached £3,775,040 (of which total £3,021,440 was by way of grant).

Communications. The is, is intersected by good roads, and there are some 213 m of rallway. The J Gov. rallway (gauge 4 ft. 8½ in.) starts from Kingston, which it connects with Spanish Town (33 m.). Old and to the organisation of a scheme of

Communications. The is, is intersected by good roads, and there are some 213 m of railway. The J Gov. railway (gauge 4 ft. 8½ in.) starts from Kingston, which it connects with Spanish Town (33 m.), Old Harbour, Porus, and Montego Ray. Another line runs from Spanish Town to Hog Walk and Port Antonio. From Bog Walk, Ewarton is reached by another branch line and another line opens up the Rio Minho valley and Upper Clarendon from May Pen. Kingston has a service of electric trans and motor omnibuses. There are telegraph stations and postoffices in every tn. and in many vils.

offices in every tn. and in many vils.

Chief Torms.—The chief tn. is Kingston, the seat of gov. and the largest port and tn. (pop. 109,000); the next in in portance are Spanish Town (12,000). Montego Bay (11,500); and Port Antonio (5,500). Headquarters House, formerly Hibbert's House, where the Legislative Council has net since 1870 (when the seat of gov. was transferred from Spanish Town to Kingston), and the colonial secretary's offices are situated in one of the few buildings of note in Kingston which escaped the carthquake and fire in 1907. A notable institution of Kingston is the Institute of J., rebuilt, after the earth quake, in reinforced brick and concrete. It has a large library, especially rich in Jamalcan and W. Indian liberature. In its Hist, gallery are many notable treasures, including the original 'Shark Papers' exploited by Michael Scott (q.v.)

in his Cruise of the Midge; the bell of the old church of Port Royal; and two silvergilt maces, formerly belonging to the Council and the House of Assembly. The Council and the House of Assembly. The Institute also has a museum containing zoological, geological, botanical, and archæological specimens. King's House, the residence of the governor, is 4 m. from Kingston, in St. Andrew, on the Liguanea Plain. Port Royal, at the extremity of the Palisadoes, is of historic interest, having been the headquarters of the buccaneers, and the mart of their spolls. Prior to the carthquake of June 1692 it was reputed to be the finest tn. in the W. Indies. In Port Royal is Fort Charles, where Nelson commanded in 1779. The staircase to what is known as 'Nelson's Quarter Deck,' a space on the ramparts by the admiral's old quarters, still stands. Port Royal used to be a notable naval station, but the dockyard was closed in 1905, after an existence of 21 centuries. Spanish Town (13 m. from Kingston), the old st. Jago de la Vega or St. James of the Plain of the Sp. days, was formerly an imparted. Plain of the Sp. days, was formerly an important tn. and the well-built group of Gov. Buildings round its central square Gov. Buildings round its central square bears witness to its former grandeur. The most notable of these was the King's House, the former residence of the governors, of which little more than the façade remains. The N. side of the square is ornamented by a stately memorish to Adm. Rodney, victor of the battle of the Saints (q.r.). Near the Square is the Cathedral, dedicated to St. Catherine, whose red brick fabric is in pleasing contrast to the surrounding foliage. It is one trast to the surrounding foliage. It is one of the three oldest eccles, buildings in the W. Indies (the others being the cathedrals at Havana and Cartagena). Bog Walk is a vil. close by a noted gorge of the Rio Corbe. Port Antonio, on the N. side of the is.. 75 m. by train from the cap., is situated on the shore of a spacious harbour. Formerly a vil. of modest size, it rose to a position of prosperity through the banana position of prosperity tarough the bename industry, but suffered when the United Fruit Company moved their headquarters to Kingston. Montego Bay, second the J. is 12 m. by rail from Kingston. When sisted by Columbus it was a large Indian throat of Americal High have been vil. and traces of Arawak life have been found in the neighbouring caves. Its par. church is one of the handsomest in the is. Savanna-la-Mar, the chief tn. of Westmoreland, is the port of a sugar, coffee etc., growing dist. Falmouth (106 m. from Port Antonio) was once a port of some note. Not far from Ewarton are the Roaring River Falls, the largest waterfalls in Jamaica. St. Ann's Par. is a favourite

in Jamaica. St. Ann's Par, is a favourite place of visit on account of the views from Mount Diablo. Mandeville is a favourite resort of winter visitors to J.

Population. The census taken in Jan. 1943 shows a total of 1,237,063 persons resident on the is. (598,267 males and 638,796 females). The estimated pop. in 1945 was 1,289,051, the natural increase being about 18 per thousand. The white pop. numbers about 15,000, the coloured about 200,000, Indian Asiatic, 30,000 and the rest blacks.

Dependencies of Jamaica. Under the

of J. came into force in Nov. 1944. The position of J. was unique, because the colony was returning to a form of responsible, representative gov. after an interval of 78 years, and because the proposals for reform submitted to the spokesmen for reform submitted to the spokesmen for organised public opinion were, to all in tents and purposes, adopted in their en tirety. A bicameral legislature was set up, consisting of a House of Representatives of 32 members elected on a basis of universal adult suffrage (women were enfranchised in 1919 but there was then a prohibitive property qualification) and a nominated Legislative Council of aftern official and publishings. fifteen official and non-official members The old Privy Council of J disappeared from the Constituion, except for questions of perogative, in invoir of an Executive Council of ten, of whom five are elected by the House of Representatives, and by the House of Representatives, and three official and two unofficial members nominated by the governor from the Legislative Council The governor himself is the Chairman with a casting, but not an original, vote. This new body is the prin instrument of policy, with the duty of preparing the budget, and of having to approve Bills, by a majority, before their introduction in either House of the Legislature. It functions, in effect, as a Cabinet, and the five elected members are appointed Ministers in charge of depts of administration They are the leader of the House of Representatives, who as is as chairman of the Finance Committee of that Chamber, and the ministers of communications, agriculture, education, and social weitare, who preside as such over House committees concerned with their depts. The power of certification of measurements which he considered contents that depts The power of certification of measures which he considers essential but which have been rejected by the Legislature, is exercised by the governor in accordance with the advice of the Lxecutive Council and he retains the power of veto, but, before refusing assent, must consult but, before refusing assent, must consult his ministers and, if they do not agree, the secretary of state. The Constitution is to be tried out for a full electoral period of five years, after which the position is to be reviewed. A general election, held in Dec. 1944, returned to the House of Representatives twenty three Labour Members, four representing the People's National Party and five Independents—thase latter closely allied with the J National Party and five tudependents—these latter closely allied with the J Labour Party led by Alexander Bustamente, minuster of communications. Serious labour troubles occurred in 1946 leading to fatal casualties, Bustamente and the minister for social welfare being stated but acquitted on a charge of respectively. tried, but acquitted, on a charge of mansiaughter

Education.—The Imperial (iov., in 1946, decided; after consideration of the Report of the W Indies Commission on Higher Education in the Commission on Higher Education in the Colonies to estab a W. Indian Univ Col lege is J. In the first instance the college will be given the status of a univ. college and will prepare students for the degrees

gov. of J. are Turks and Calcos Is , and | that the college will, after a reasonable Cays Is. (see under their names). | formative period, become a centre of Constitution.—The present Constitution | teuching and research. It was also decided to estab. a permanent medical faculty as an integral part of the college. The univ. received its royal charter in 1949 A beginning has been made to erect permanent buildings for the univ., which, at present, is housed in huts outside kingston.

Liters and Fyffes Ltd BINANA HARVESTING IN JAMAICA

History .- J was discovered on May 3. 1494, by Columbus, who called it Sant Jago but it has retained its Indian name Xavinaxa' or Xavinaca, land of water' There is much cucumstantial evidence about his landing on the above date in the works of Bernildez, Peter Marter, an abbet of Jamaique during the sharter, an about of Januaque during the Spoccupation, and in the trans from the It records by t ilon. Washington Irving's lafe of Columbus tells us that Columbus landed in Puerto Bueno or the bay later called Dry Harbour but he has no authority for his supposition. There is no reliable evidence to ideatify the land-fall of Columbus in J or the port or bay where he careened or repaired his battered the Nefar which had becreakly. caravel, the Nifa, which had borne him southward from Juana or Cubs in quest of Santingo or Kaymaxs or Jamaiqua so it was variously called, or some such is, as he had been truly led to believe tay in that quarter and where he thought to find extravagant treasure in gold and preofess stones. According to Frank Cundail, J.'s modern historian, the distinction of being the place of his landing appears to be about equally divided between St. Ann's Bay and Fort Maria. It was not till mine of Leadon Univ. Eventually, it is hoped years later, on his fourth and last voyage.

that Columbus again visited the is. caught in a violent storm, he ran his ship-aground near St. Ann's Ray, on the N. coast. He came this time not as a Sp. vicoroy but as a shipwrecked refuge, disappointed and broken by the persecution of his enomies. His crews being mutinous and the Arawaks or natives of the is. unwilling to bring him the supplies they had brought on his first visit. Columbus would have starved to death but for playing on the superstitions of the Indians by pre-dicting an eclipse of the moon, a trick which many an explorer has used since in fact and in fletion. When Columbus died (1506) his son Diego inherited his property and went out to Hispaniola (now Haiti and Santo Domingo) as governor. On arriving there he found that J. had been partitioned between two Spaniards, and in order to estab his title, he sent Esquivel to found a settlement in J. under his direction. This settlement was founded on the N. side; but in 1 31, because the vessels salling to and from Spain the tr of St. Jago de la Vega, now Spanish Town. was founded, and this soon became the chief in In 1596 the swas attacked by the Eng, under Scholler, who pillaged Spanish Town, and in 1643 Col Jackson, with some 500 men, landed at Port Royal and exacted a ransom from the Spaniards. J., however, remained in Sp. hands for 161 years, and it was not until May 10, 165; that it changed hands, when Adm. Ponn and Gon. Venables, when Adm Fenn and Gen. Venilles, having been disastions of defected on April 17 and 25 off Hepaniola, gave up the attempt on that is and sailed for J. instoad. Venables reached J on May 10, and the chief the was occupied with next to no fighting and Governor Don Christowal Arnaldo Ysassi was forced to capitulate on May 17. Venables' 'conduct of the campaign' was unskilful to a degree: the campaign was unstituted in degree; while Penn, father of the Quaker founder of Pennsylvania, seems to have done little cise but quarrel with Venables Later, under the auspires of the viceros of Mexico and the governor of Cuba a formidable expedition was fitted out with which Don Ysassi hoped to recover J. But the bravery of the Eng. soldiers dismayed the Sp. commanders at sea and they left the Sp. invading forces in J. to their fate and to the aputhy of the Sp colonists. After this we enter on the constitutional period of Jamaican hist, when civilian governors succeeded military men. The first Eng governor was Col. D'Oyley, who may be regarded as the real conqueror of Jamaica. In 1661 P'Oyley's military command was changed into a civil governorship and his commission from Cromwell instructed him to govern with the advice of an elected council. The African slaves of the Spaniards, who had been brought into the is, after the virtual extermination of the Arawaks, and who were called Marcons, fled to the nit. fastnesses, and they were not finally pacified formed Evre (see and this famous case k. B. until the end of the eighteenth century when, following a rebellion, many of them were deported to Nova Scotia. The year layed a conspicuous part in the transactions he records thirty years later; also

Being the insurrection of the Coromantyns in is ships Ballard's Valley under a leader called the N. Tacky—certainly one of the most danger-ous risings in Jamaican annais. In June 1670 the Brit. occupation of Jamaica was formally recognised by the treaty of Madrid. Colonisation went on and there was a large influx of soldiers and of unwas a large innux or soluters and of midewrable refugees, neither of whom made good settlers. Other settlers came from Nevis and other W. Indian is. J. at this time became one of the hidring places of the buccauseers, freebooters of all nationalities. ilities, who were opposed to the rule of Spain. One of the most famous was Henry Morgan, (qv.) whose exploits are narrated by the Dutch burcaneer, Es-quenceling, who sailed with him (see John Esquemeling, Bucaniers of America, 1684). Morgan eventually became governor of J. as ar Henry Morgan.

J.'s hist, from the late 1790's until 1831 is the story of the anti-slavery struggle to eventual omancipation. Successive colonial sceretaries sought to prevail on the Jamaican legislature to adopt orders in council for the betterment of the condition of the slaves, but the old House of Victor Hugues, the Fr. W. Indian revolu-tionary and friend of Robespierre, came to I and tried to work up insurrection and to I and tried to work up insurrection and bloodshed, and this it was that led to the rebellion of the Trelawney tribe of Myrons in 179. In the critical days of the entry 1830's of J.'s hist, it was fortunate for the is that it had as its governor the entry 1830's and the large Lord Normanby, where it has been benefit a retrieved. who was the most man to hardle a petuthat House of Assembly, which was always disposed to dispute the authority of the Imputal Gov. and even the royal promitter. It was largely through his concilitory hearing and firmness that the Assembly was at length induced to accept the BULL for the ubulifion of always. the Bill for the abolition of slavery. Edward John Eyre, a most experienced colouid administrator, became governor of in 1864. The is, fell upon will times through economic depression and the state of its inances necessitated new taxastate of its manners necessitated new taxa-tion. The resulting discontent led to a rising on Oct. 11, 1465, known as the out-brack at St. Thomas in the East. Mar-tial law was proclamar in the dist. and Groupe Win. Gordon, who was said to have metted the people, was taken from Kingston to Morani Bay, tried summarily, and barged. Gordon was a coloured and harged. Gordon was a coloured number of the Legislative Council and a considerably landowner but he was prone to inflammatory utterances. This may to inflammatory utterances. This may or may not have justified his apprehension; but, by transferring him from Kingston, where martial law had not been declared, to Morant Buy, where it had Eyre committed a technical blunder. Later an enquiry was begun in England by a hostille committee of which John Stuart Mill the committee of which John Stuart Mills as chairman, but a rival committee under Thomas Carlyle and Charles Kingsley defended Eyre (see on this famous case E. B. Underhill, The Tragedy of Morant Bay, 189)—a blased work by a man who played a conspicuous part in the transaccontroversial, but on the other side is Lord Olivier's The Myth of Governor Eyre (1933) and see also the judicially minded work The Sugar Colonies and Governor Eyre (1936), by Wm. Law Mathieson) This reverberating event was followed in 1866 by a drastic change in the gov of J. The one-time recalcitrant Assembly, with its charter and large local rights exercised by a very small class, had become of small influence now that the large sugar planter, who, in 1805, numbered noarly 900 were reduced to 300 in 1865. Strong central gov. under the Crown was the only remedy and so J. was made a crown colon with a gov. and council appointed by the Imperial Government (see further

by the Imperial Government (see further under Government, above).

Boy Scouts' Association to their national and world rallies. In cuchic (q.v.) it denotes a single hand containing the five highest cards.

highest cards.
Jambu-dups, one of the seven continents of the world, in the Mahabharata, embracing the gods' dwelling place and the mountain of Meru with its 'jambu' or 'rose-apple' troe. Mountains divide it into nine countries, Bharata (India) being the chief. Poetry and Buddhistic works give the name to all India. Others apply it to the mt. dists. only (N.W.), and others to the whole of Asia. others to the whole of Asia.

Jambul, region of the Kazakh S.S.R.

Pop. 62,790. Jambusar, Jambusar, tn. and municipality of India in the Broach dist., Bombay, situated about 28 m. N.W. of Broach.

Pop. 11.000. of three important James, name of three important i. (trans. 1909) and commentaries by figures in the Apostolic Church: (1) The Ewald, Mayor, and writers named in

son of Zebedee and brother of John, one of the most important of the apostles according to the Synoptic accounts. He and his brother received from Jesus the surname 'Boanerges,' explained as meaning 'Sons of thunder.' In Acts 1. 13 ft. he is mentioned among those who, after the Resurrection continued stoadfast in prayer at Jerusalem. He was the first of the apostles to suffer martyrdom, being put to death in the year A.D. 44. by Rerod Agrippa (Acts xii 1 ff.). Legend speaks of his having made missionary Journeys to Spain, of which country he is the patron saint (2) The son of Alphaus, was also an apostle. There has been much discussion as to whether he is to be identified with (4). Mark xv 40 ff. speaks of his mother as a certain Mary, but little is known of him. (3) The 'brother' of Jesus, surnamed the Just, was, according to Epihanius, the son of Joseph by a former marriage. Hegosippus (see Eusebus, Historia Ecclesiasticu, il., 23) gives a detailed description of his accetic life of the kind that would appear ideal to an Rhionite, and Josephus (Ant. xx. 9) also tells us that he suffered death by stoning in A.D 62 under the high-priest Ananus. He was the head of the Jewish Church at Jerusalem and seems to have been the leader of the Judaising party, eager for the observance of the law

Ine conservance of the law

James, Saint, The Epistle of, is placed
first among the Catholic epistles. Its
title is short, James a, servant of God
and of the Lord Jesus Chust, to the twelve
tribes which are scattered abroad.' The traditional view identifies this James with James the Just, Bishop of Jerusalem, and those who hold this view place the date of the epistic very early, before the epistic to the Hebs, and probably before St. Paul's first missionary journey. The epistle is therefore not to be regarded as a pole-inical treatise against the Pauline view of faith, but as an independent address to Jewish Christians from a different point of view. Though the apparent autithesis between the insistence of Paul on justification by faith and the emphasis which James lavs upon works is great, so much so indeed, that Luther characterised the opstic as 'an epistic of straw,' the two views are not contradictory. An almost views are not contradictory. An almost entirely different opinion was held by the Fubingen school, now somewhat dis-credited. They placed the epistle very late Schwegler and Hansrath ascribed it to the time of Trajan, Hilgenfeld to that of Domitian, being supported in thus dating it by Holtzmann and Von Soden. Most of these critics consider the epistle to be the work of a member of the Rom. Church, writing in direct opposition to the Pauline propaganda, for the position of the Tubingen school depends largely on their assumption of an opposition through-out the NT between the Basiline theology. out the N T. between the Pauline theology and that of the older Jewish Christianity. The epistle deals, however, with life not with doctrine. There was some difficulty as to 114 admission into the Canon. Son Zahn's Introduction to the New Testament

article. See also J. Moffatt, Introduction to the Literature of the New Testament, 3rd ed. 1918.

James I. (1394-1437), king of Scotland, James I. (1394-1437), king of Scotland, the son of Robert III., at an early age was sent to France by his father. He was, however, captured by Eng. sailors on his way there, and was imprisoned in England by Henry IV. (1406). In the same year and probably a month later than his capture, his father died and he became nominally king of Scotland. The gov. of Scotland was conducted by the duke of Albany, the king's uncle, who showed no Albany, the king's uncle, who showed no desire to ransom his norther. His education was by no means neglected, and he proved himself one of the best-educated princes of Europe. He was also very active and a good athlete. After accompanying Henry V. to France he was, in 1421, restored to Scotland, the Scots promising a hugo ran out. He had married in the same year, Jane Beaufort, daughter of the duke of Somerset. He was crowned in 1424 and with his real accession begins constitutional monarchy in Scotland. He caused the overthrow of Murdoch, duke of Albany, and his son, and proved so powerful a king that he made many enomies. He crushed the "ulent nobility and was finally murdered by Graham. He was finally nurdered by Graham. He holyrood, he reason several taled in was the author of two poems, The Kingis highest position she had yet attained in Quair and Good Counsel. See A. M. I'm noe, and during his reign the Scottish Quair and Good Counsel. See A. M. Mackenzie The Rise of the Steuart, 1329-1513, 1935; E. Balfour-Molville, James I. (1430-60), the only surviving

James I. He was brought up during his minority under the care of his mother, the earl Douglas acting as regent. and after the second marriage of the queen he passed into the custody of Sir Alexander Livingstone. Aboost continual continual civil war waged during the period of hi-minority, the prize of the victors being the custody of the king. In 1449 J. married and assumed the royal power. He immediately proved himself a strong king. He custed Livingstone to be ex-cented and later stabled Douglas with his comp hands. He consoled the move of the own hands. He crushed the power of the great nobles, and was supported by the majority of them, and also by parliament. the sympathised with the Laucastrian cause in England during the wars of the Roses, and after their defeat he attacked the Eng. possessions in the S. of Scotland. the Eng. possessions in the S. of Scotland. At the sloge of Roxburgh he was kalled by the bursting of a cannon. On the whole the gov. and justice were improved and reformed during his reign. Sec J. Halfour, Annales, 1057-1653, 1825.

James III. (1451-88), the eldest son of James II. He became king at the age of nine, and his minority was speut in the custody of Sir Alexander Boyd. In 1469 he married the durchter of the king of

he married the daughter of the king of Denmark and assumed power himself. The nobles submitted to him, but his deare for peace and for a quiet life soon began to make him unpopular. His brothers plotted against him; both wore arrested and one of them died in prison. The other fied to England and was recog-nised by Edward IV as king of Scotland. War broke out with England, and the lay on his deathbed that a daughter had

duke of Albany and Richard, duke of Gloucester (Richard III.) were, owing to the actions of the barons, able to march upon Edinburgh. Peace was made, but again Albany rebelled and finally died in 1185. The barons, unable to appreciate the peaceful policy of J. towards England, in billed and defeated the king at Samble. to belled and defeated the king at Sauchleburn, where, according to tradition, after the buttle he was slain by a soldier in the disguise of a priest who was called in to shave him. See A. Lang, History of Scot-

land, 1900-07.

James IV. (1475-1513), was the eldest sol of James III., against whom nominally he ought at the battle of Sauchieburn. If was crowned immediately after his nother's death, and at once took over the the magement of the affairs of the realm He had little or no trouble with his publes after the frustration of a plot formed at the beginning of his reign to hand him over to the Lng. king (Henry VII. Tudor), and he was intensely popular with the commons. He supported Perkin War-bed, against Henry VII., but the pro-perted war with England came to rething. and in 1503 the marrane between Mar-gret Tudor and J., which was to result in the union of the crowns, took place at holyrood. He raised Scotland to the court was retined and enlightened. The accession of Henry VIII. led to continual backerings between the two countries, and inally in 1513 J. declared war. He carned some successes at first, but was hadly overthrown at Flodden, He daplitus bravely, and with him perished the flower of Scottish nobility. He was a nam of generous nature, and an energetic kms. See J. Skene, Memorabilia Scotica, 117, 1612, 1923. James V. (1513-42), king of Scotland.

James V. (1513-42), king of Scotland, on oi James IV., succeeded his father at the age of one year, and between the years 1513-28 the country was in a state of constant turnoil, owing it frequent collisions between the Fr. and the Englantes in Scotland. The queer dowager was for a time regent, but finally Albany, at the head of the Fr. party, occupied that position. The king fell but the hands of the Douglases who kept hum prisoner partit the Douglases, who kept him prisoner until the year 1528, when he escaped and began to rule personally. He put down disorder with a firm hand, and proved himself a very capable king, but he was unpopular with the nobles, since he restricted their power too much. He was highly popular with the commons, however, whose rights he preserved. He married in 1538 Mary of Guise. He supported the old form of faith in Scotland, principally because he relied on the clerky for support against the nobles, and refused to follow the lead given by his nucle, Henry VIII. This regiven by his uncle, Henry VIII. This re-fusal to listen to the advice of Henry VIII. led to ill feeling between the two coun-tries, which terminated in 1542 in the out-break of war. The nobles revenged them-selves by deserting their king and leaving him to be overwhelmed at Solway Moss. Shortly afterwards he died, learning as he been born to him—the later Mary Queen of Scots. See E. M. MacKerlie, Mary of

Guise-Lorraine, 1516-1560, 1931.

James I. (1366-1825), king of Great
Britain and Ireland (formerly James VI. or Scotland), the son and only child of Mary Queen of Scots and her second husband, Henry, Lord Darnley. He was born at Edinburgh Castle, and became king in 1567 whon his mother was forced to abdiet. to abdicate. He was a boy of great weakness, and never became a strong man, although he lived for nearly sixty years. He was kept outside politics altogether up to the year 1578. He was brought up first of all under the care of the carl of Mar and his countess, for both of whom he seems to have had much affection. Later, on the death of Mar, Sir Alexander Erskine took him into his charge. His education was by no means neglected. George Bucharan being his principal tutor The times made it necessary that he should be trained as a Protestant, and should be trained as a Protestant, and therefore the cheological side of his cducation was pursued. It was not until 1583 that J. began actually to rule. His reign as James VI of Scotland was altogether for the good of that country. J. broke the power of the baronage and restored the power of the monarchy. He gained the favour of the people, and he was able even to curb the pretensions of the Prestreign Church, and to introduce a form even to cure the preteinsons of the Pres-byterian Church, and to introduce a form of episcopal gov. He had been brought up as a Presbyterian, but he never had any very great love for Presbyterianism. Ho believed above all in the divine right of tings, and held that the chief supporters of this theory—the bishops—were alone to be supported. In England, however, his career was otherwise. He was accepted by his Fig. subjects largely because the alternative to accepting him was civil war. But his pretensions, his in-tolerance, his personal appearance, and his manners did much to alienate his sublects. His claim of divine right, which he supported by pretence to powers of dis-pensation and suspension of the laws, quickly gained for him enemies in Eur-land. The failure of his foreign policy and his desire to pose as the arbiter of Europe were also points against his general popuwere also points against his general properties the falled altogether to see the weakness of Spain, and his desire for a marriage alliance with that country weakened support in England. His reign from 1603 to 1625 may be regarded as one of the essential preliminary causes of the outbreak of civil war in 1612. Truly it has been said 'James sowed the wind, Charles reaped the whirlwind.' He has also been aptly described as the wisest fool in Christendom. He was certainly well educated and well read, but pedantic

Mackio, Canalier and Puritan, 1936.

James II. (1633-1701), king of Great
Britain and Ireland, was the second surviving son of Charles I., and was created
duke of York in 1643. During the Civil
war he was captured by Fairfax, but
escaped to Holland in 1648. During the
twelve years which elapsed between this
date and the Restoration, he proved himself an able soldier, and was commended self an able solder, and was commended both by Turenne and Condé. On the res-toration he was appointed Lord High Ad-miral and Warden of the Cinque Ports. He proved himself an able officer and a wise administrator, and gained a great reputation both for ability and courage. His private life was, however, as immoral as that of his brother, the king. He married Anne Hyde in 1660, under exceedingly discreditable circumstances. By her he had issue Mary and Anne, who both ascended the throne. His second wife was Mary I) Este of Modena, who bore

JAMES II.

him a son, James Francis Edward, known as the Pretender, and a daughter, Mary Louisa, who died young. He avowed himself a Rom. Catholic in 1682, but after the passing of the Test Act, he was forced to give up his offices, and later the Popish Plot drove him to Holland. His exclusion from the throne was proposed by the Whigs, but after Charles's triumph ho was Commissioner for Scotland, where he instituted cruel persecutions of the Covenanters, and later he was again made Lord ligh Admirel. He succeeded in Feb. 165, to the throne. He promised to defeat the Church and the laws, and was well educated and well read, but pedantic to a degree. His general reading and his intellectual interests show that he had intellectual interests show that he had received as king with some popularity, great sympathy with the education of the time. Amongst writings of his may be mentioned, Essays of a Prentse in the duced Catholies into the army and the Divine Ario I Poesie (1584); Counterblust in Tobacco (1604). See H. G. Rosedale, ling with and suspending the laws of Spanish Match, 1908; R. S. Rait, James's England. The Declaration of Indulgence Secret, Elizabeth and James VI., 1927; and the refusal of the bishops to read it in H. J. Laski, Political Ideas of James I., libel. They were acquitted amidst the the topographical dept. of the War Office applause of the nation and even of the in 1857, and was knighted in 1860. He is army which J. had gathered at Hounslow famous for having applied photo-zincoto overawe London. The birth of a son to overswe London. The pirth of a sont to him destroyed Eng. hopes of a Protestant succession, and induced a group of Eng. nobles to send an invitation to Wm. of Orange, without which he would not come. J. was sublimely unconscious, in spite of repeated warnings, of what was happening, but awoke to the danger after the arrival of Wm. of Orange in England. He attempted to retreat, and finally fled the country. His first attempt to escape failed, and he was brought back, but allowed to escape again. He crossed to France, and from there to Ireland, where he was defeated at the Boyne (1690). He seems to have lost his old courage, and behaved with great cowardice. Two behaved with great cowardice. Two other attempts to restore him (the battle of La Hogue (q v) and the Assassination Plot) falled, and after refusing the crown of Poland. J. died at St. Germains in France. He was narrow-minded, and against him. To these two causes his failures may be chiefly attributed. See lives by H. Reline 1928; F. M. G. Higham, 1934; i. C. Curner, 1918; also J. Marriott, Crisis of English Laberty, 1930; M. Hay, Wenston Churchill and James 11., 1934.

James, David (1839-93), actor, whose real name was Belacco, b. in London. He made his first appearance at the l'rincess's Theatre under Charles Lean, but subsequently appeared at the Royalty in 1863, where he played in Burnaud's burlesque of Irian, and estab. his reputation in 1870 with his performance of Zekiel Homespun with his performance of Zekiel Homespin in the Herr at Law. His played at various theatres in many parts, but his most successful was Perkyn Middlewick in Our Boys. This piece was played over 1000 times, and was claimed as 'the longest run on record.'

James Francis Edward Stuart, see

STUART, JAMES FRANCIS EDWARD. James, George Payne Rainsford (1799-1860), Eng. novelist, b. in London. Taking to literature early, he attained some success as a writer of miscollaneous articles, and in 1822 produced a Life of articles, and in 1822 produced a Life of the Black Prince, followed within the next thirty years by over a hundred books, mostly novels, the remainder hists., plays, and verse. Many of his tales are historical, Richelieu (1829) being one of the best. They were very popular, having plenty of adventures told in good Eng., though the characters are mere lay-floures. His style is parodied by Thackunougn the characters are mere lay-figures. His style is parodied by Thackeray in 'Barbazure' in Novels by Eminent Hands. Though J.'s histories are compilations of no great value, he was for some time historiographer-royal to Wm. IV. From 1850 to 1860 he was British consul successively in Massachusetts, Virginia, and finally Venice, where he died.

James, Sir Henry (1803-77), directorgeneral of the Orduance Survey of England and Wales, b. in Cornwall. He was
appointed in 1827, and was made directorgeneral in 1851. He was also director of ber. The last was: The Outery, (1911).

in 1857, and was knighted in 1860. He is famous for having applied photo-zinoo-graphy to ordnance maps (1859), on which subject he pub. a book entitled Photo-zincography and other Photographic Pro-cesses employed at the Ordnance Survey Office.

James, Henry, Lord (of Hereford) (1828 1911), Eng. lawyer and statesman, b. at Hereford, and educated at Cheltenham. Called to the Bar in 1852 he became Q.C. year as Liberal member for Taunton, which seat he retained until 1885. In 1873 he was appointed first solicitor. general, atterwards attorney general, and received a knighthood. Resuming office under Mr. Gladstone in 1886, he was offered the lord chancellorship in 1886, but declined to accept it, having broken away from his leader on the Home Rule question. Elected for Bury (Lancs.) in 1886, and re-elected in 1886 and 1892, he became a leading Unionist. At the holding of the Parnell Commission he appeared with Sir Richard Webster as counsel for The Thuse and in 1896 took bis east in The Times, and in 1895 took his seat in the Salisbury cabinet as chancellor of the duchy of Lancaster with a peerage. A on moral free trader, he strongly opposed the Tariff Reform movement in 1903 During the latter years of his life he took great interest in the Imperial Institute file was a good sportsman, and for some time president of the M.C.C.

James, Henry (1843-1916), Amerauthor; b. in New York; son of Henry J., an eminent theological writer and lecturer. He and his brother Wm. (q.v., were in their boyhood educated in England, France, and Switzerland, and after wards at Harvard. Henry was intended for the law, but took to literature instead --encouraged by W. D. Howells, then editor of the Allantic Monthly, in which I's first story appeared in 1865. For four veris he remained in America writing stones in sketches; in 1869 he removed to England. Beginning with the novel if alch and Ward (1871), he pub. a large number of vols.; including novels, collected stories, travel-sketches, criticism, and biography. In spite, or perhaps because, of the peculiar grace and distingland, France, and Switzerland, and after and nography. In spite, or perhaps occurse, of the peculiar grace and distinction of his work he was rather long in arriving —his first great success being the tale of Daisy Miller (1878). He afterwards won universal recognition as being that in the own residentic recognition as first in his own particular school, a school of tar removed from those of older masters of fiction that it has had to create its own circle of admirers. Intensely subtle and analytic in its portraval of character, dealing little in incident; but probing the depths of individuality, of internal strife, of closely-woven intricacles of thrucht and feeling—it has nothing in common with romances like those of Scott and Pumas, or bread vigorous stories of every-day life as told by Dickens. Very chargeThe Foory Tower (1917) and The Sense of the Past (1917) are unfinished. He lived at Rye, Sussex. He was onthusiastically at Rye, Sussex. He was onthusiastically for England on the beginning of the Eirst World War. in July 1915 he became naturalised as a Brit subject. He is ceived O. M. in the very of his death. See the Radonna (1822) The House of Liham (1816), Lives of Edgar, Henry James, Info and Luther, 1927, Van Wyck, Brooks, Pilgrinage of Henry James, 1918, John Stevenson and K. B. Murdock, The Notebook of Henry James and Robert Louis Stevenson. A Record of Friendship and Criticism. James, William (il. 1827), naval his torian, practised in the Lamaics Supreme Court (1801–13). He was detained prisoner in the U.S.A. in 1812, but escaped to Nova Scotia in 1813. He pub various pamphiets on the comparative ments of the Eing and Amer. navics in 1816, but.

co Nova Scotla in 1813 He pub various pamphiets on the comparative ments of the Eng and Amer navies in 1816, but his great work is his Natal History of Great Birdan from the Declaration of War by I rance in 1793 to the Accession of George IV (1820) This appeared in Nota in 1822 24, and was reprinted in 6 vols in 1826

James, William (1812-1910), Amer philosopher, brother of Henry J the novelus (o v), took his degree of M D av Harvard in 1970, and became leet up there in anatomy and physiology in 1 572 Inheriting from his father a love for subtle reasoning and mental research together with great power and freshness in expres sing his theories be became assist ant prof of philosophy (1880), prof (1897) prof of psychology (188) and prof of philosophy (1817–1907) His Fr neiples of Psycho ogy (1890) gave him a wide reputation and was reprinted in a condensed form in 1992, he wrote also The 11 life Helicie (1847), Human Immortality (1893), I all s to Touchers on Psychology and to Students in Life's Ideals (1899) The Varieties of Relaxions & Marches (1899) The Varieties of Relaxions & Marches (1899) The Varieties of the Relaxions & Marches (1899) The Varieties & Marches (1899) The Relaxions & Marches (1899) The Varieties & Marches & Religious Leprinence (1902), Pragmatism (1907), 4 Pluralistic Universe (1908), and The Meaning of Truth (1909) His home was at Cambridge, Mass to husetts, but he visited Europe on sev occasions, and was invited to deliver the Gifford Letures on natural religion at F dinburgh (1899–1901) and the Hibbrt lectures at Manchester (wilege, Oxford (1908) Honorary description of the Manchester (wilege, Oxford description) grees were conferred on him by the univs of Padua, Edinburgh, Princeton, Oxford, Durham, and Geneva

glaciers drop towards the sea. The is. glaciers drop towards the sea. The iss economically useless; but it is conveniently situated for the estab. of a meteorological station for the recording of Artic storms It was once a vital factory site in the centre of the Arctic whaling grounds. The whales have gone, whaling glounds The whales have gode, but truces of the hunt and the hunters were found in 1947 by the Oxford Univ. expedition on every lonely beach. The earliest hist, of J. M. I is lost even to the Norsemen's legends, but it is agreed that it was discovered long before the whaless it was discovered long before the whalers made it their summer home. A little over three centuries ago mariners from various nations 'discovered' J M. I. One of the first of these was the Dutchman Jan May, who landed on the is. In 1614 and whose name it now hears. It was probably discovered inst by Henry Hudson in 1607, though others, besides Jan May, since his time have claimed to have discovered it. Fr. whalers called it the Isle de Richelieu; in the early days of their whale hunting the Dutch seem to have na ned it St Maurice, while their greatest ishing rivals, the Eng called it Trinity or Sir Thomas Smith's Is. The diaries of early voyagers, however, all diaries of early vovagers, however, all comment on the stark barrenness of J. M., including that of Robert Fotherby, the Eng captain who visited the is in 1615, and reported that in the lowlands 'ail the stones were like unto a smith's sinders both in colour and forme, the sand is generally mixed with a corne like amber. The Oxford expedition have confirmed that this 'amber' is formed of pretty yellow green obvine crystals which shine from the black laval sand of the beaches. The flora of lichens and mosses chings preat times is covered with fulmar, petrols, kittiwakes, little auks, guillemots, and puffins. The Oxford Expedition found the is unmhabited except for the personnel of a meteorological station maintained by the Norwegian Gov In damp place under the cliffs vogetation is lush and varied, comprising such familiar things as dandelions, bilberries, anemones and flowering saxifrages. But at alti-tudes of 7000 ft., and 5000 ft above the mow line may be found mosses and orange

snow line may be found mosses and orange in hims projecting through the snow. (See 'Oxford Goes Exploring,' by A J. Marshall, leader of the Oxford Univ. Expedition, the Times, Nov. 21-25, 1947.)
James and Jambres, legendary names of the two wizerds who 'withstood Moses' (Ex vil 2; 2 Tim ii. 8) According to some traditions they were the 'two youtles' (R.V. 'servants') who accommund Velenon, when he went in the owner. young (it v. servants) who accompanied Balaam when he went up to curse Islaid (Targum I.; Numb. xxii 22). They were the subject of many legends, and a book Pantentia Jannis it Mambre is referred to among the apperephal books by Origin See Schurer, Gesch. iii. 292 et seq

Jan of Mabuse, see MABUSF
Jansen, Cornelius (1985–1648), a Dutch
divine, founder of the school of theology known as Jansenism He studied at Louvain and Paris, returning to Louvain as a prof in 1617 He lectured on scripture at the univ for nearly twenty years and was the k ader of the nniv in a bitter controversy with the Jesuits In 1626, he led a deputation to Spain to plead the cause of the univ against the Jesuits, and was successful in getting their author isation to trach the humanities and phil osophy withdrawn by the Court of Ma lind

CORNELLOS JANSEN

Meanwhile he was working on his great theological treatise, the lugustimes designed to restore the teachings of S Augustine to their true place in Christian In 1656 on the recommenda teaching tion of Philip IV he was made bishop of Ypres in 1636 but died som after in an epidemic in 1638 He had never had a conflict with Rome and in his list will and testament declared that he died obedient son to that church in which I have lived to my dying hour ' I wo yours after his death the lugustinus was pub and it immediately appeared that J had favoured the opinions of B ins, an earlier chancellor of Louvain Univ who had taught a doctrine of grace with rescan blances to (divinism. The luguestrans had an immense success, and was defended by the friends of I breaded by Arnauld (q v) For the subsequent hist

Jansenism After the deth of the Dutch divine Jansen in 1638 most of his works and letters were pub, particularly the Augustinus in three vols in 1640 Although Janson had been strongly anti Protestant, some of his tenets resemble ! demned by the Vatican in 1641 Some of Jansen's friedly in the fathers is brilliantly idecided Louis XIV., Jansen's frieds, especially the fathers of at the instigation of the Jesuits, had the Port Royal, headed by Arn unld, defended nunnery demolished. There was further these same propositions, and though in persecution after the issue of the Papal

1653 they were declared heretical, Arnauld would not give way. In 1656 he was de-graded and eviled, and in 1661 his ad-herents were ordered to sign a renunciation of his teaching on pain of imprisonment A truce was estab in 1669, and for thirty A truce was catab in 1669, and for thirty years the Jansenjets, protected by some powerful friends, maintained a precarious footing in I rance in 1703 Louis XIV, under Jesurt instigation, began a fierce attack on J, and in 1713 Clement XII issued the buill Unigenius, condemning the Jesterions of Quesnel, Arnauld's successor This decree had a very mixed reception in France, though the Catholic party proved the stronger The leading Janus mixty withdraw to Holland, where party proved the stronger. The leading Jansennist withdrew to Holland, where the formed a church Jansen had in tended to restore the teaching of Augustine to what he conceived to be its proper like in the church, and to prove how much it has been perverted by the schoolmen. In the first vol. of the Augustinus is defines the distinctive tenets of the second vol. assigns limits to human reason and adjusts the claims of authority with and adjusts the claims of authority with particular reference to the authoritative teaching of Augustine Reversing the time tiple of the schoolmen. J affirmed that philosophy and theology were entirely un connected with each other Original size is not mere imputation of sin, it is a lepiavation of nature and concupiscence is a taint of sin in body and soul. The cacludes with an attempt to identify the actings of the Jesuit Molina with those I the semi Pelagians The fear of God in l of eternal punishment cannot remove cul from the heart fear is a self-tro with of the feeble soul, there is nothing of Good in it, and later in the same con text Japanen attacks the scholastic notion of attrition The fundamental opposition of 1 s teaching to the Catholic Church lay in his disregarding the distinction between the natural and supernatural order. For him all supernatural gifts were not grat noral questions the Jansonists called the least a lexist, while the Jesuits called their opponents 'rigorist' In 1653 Inno int X declared various propositions of u tous but were simply man a due nt Y declared various propositions of Anthony Arnauld r injurious to God r injurious to God Anthony Arnauld 121, joining issue with the pope, argued that though the views as stated by the pope were consumable thoy were not to be fund in Jansen a work. This reply proked a long drawn dispute over papal in fallibility, the nature of which incidentally Jansen had defended in a doctoral thesis in 161. Among the most sudent supporters of I in France were the andent supporters of J in France were the immites of a numery, called Port Royal in the Fields, whose abbess, known later as Warla Angelica de S Magdalona, was the sixter of Arnauld One of the most famous idherents of I was Pascal the author of the inimitable Lettres Promecules, in which the cashistry of certain Jesuit futhers is brilliantly idiculed Louis VIV.,

bull. Uniquates, which condemned the work Moral Observations on the New Iesta ment by the Jansenist. Pasquier Qu snel (q v) But persecution merely had the effect of provoking fanaticum Marvellous cures and other miracles were attributed to Jansenists, and there arose the Couvul sionaries and klagellants. On the death of Louis XIV, indeed, J showed a bold and defiant front. The Sorbonne, which in his reign was Mollinst, became Jansen ist in the regency, and by the middle of the century, J was sensibly felt in the Fr Parliament, and its principles were openly professed by men of high colitical position. The Fr Revolution did mu h to weaken their hold but did not extinguish them altogether, and the influence of their teachings was felt in the Fr Church throughout the nimeteenth century. Io day as a separate Church they exist mainly in Holland whele they are said to number about 6000. See G Gelberon Histoire de Jansensme 1700. Incluming Settly, Herenes Leclesiastical Parties 1874. ILJI YAMA, OF FUJI-BAN

(84,102 sq. m), annexed by J in 1910, the S half of Sakhalin Is, called Karatuto by the Jap (area 1,1,14 at m.) and ceded by Russia in 190), and the Marshall. Carolino, Ladrone (excepting Guam), and Pelew is, former Ger posse sions in the N. Patific, which were placed under Jap provided under Jap the treaty of Variables. nandate under the treaty of Versailles (1919) and were renamed Nauvo, comprising a total area of 830 sq. m. with a pop. (1937) of 121,123. The coastline, which exceeds 17,000 m is long in proper which exceeds 17,000 m is long in proportion to the area, with the exception of Hondo, and is deoply indented, especially on the E shores. There are only two large bays on the E coast, those of Sendar and Matsushima, but there are hundreds of smaller indentations. Further S lie thouse of smaller indentations. Further S lie tables of surings and Ise. The famous in land sea that separates Shikoku from Kiushiu is one of the loveliest sheets of water in the world. It measures about Etchui, six of these rise to 9000 ft.; they

The is are traversed from end to end by ranges of mts, many being volcanic, some few of which are still active. The most famous nut , both for its height (12,397 ft.) and for its singular be say of form and set-ting, is Fuji-yama, or Fuji-san, it lies a suot distance from the great port of 1 okohama in Hondo, the slores are cul-tivated as far up as 1:00 ft, then moor land and forest stretch up to the summit. which is crowned with ashes and scories. The voltano appears to be extinct, having are known as the Jap. Alps. The Nikko | the brilliant sunshine assists in making a Mts. are another range famous for their beautiful vegetation and countless water- even during the summer. The typhoon, beautini vegetation and countries white-falls. The highest peaks of all are Nitz-kayama (14,270 ft.) and Mt. Sylvia, both in Formosa. These are only a few of the multitude of ranges which exist through all the is. The mt. seenery is not rugged, but soft and beautiful; the vegetation of the hill-sides is exceedingly brilliant; the highest peaks do not carry snow all the year round. One famous mt. on the boundary of Hiuga, known as Kirishimayama (5538 ft.), is especially sacred to the Jap, because the god Ninigi descended on its E. peak and introduced the first Jap. emperor, Jimmu. Many of the volcanoes have after long intervals of silence suddenly become active, such as Bandai-san (6037 ft.) which burst into terrible activity in 1888 and destroyed utterly seven prosperous vils. and hundreds of people, or Asamayamo, 90 m. S.W. of Tokyo, which was in eruption in May 1912, and caused widespread damage. The volcanic churacter of the country has given J. one great gift in the shape of numberless hot springs, widely reputed for their medicinal value. Though very mountainous the country has sev. extensive plans; that of Kwanto, which is very fertile, holds the cap., Tokyo, and the tn. of Yokohama. None of the rive, are of any considerable size, though probably no country is so well watered by network of streams and lakes. The longest riv. is the Tshikarigawa (275 m.), and one of the most important is the Tone gawa (177 m. long), its mouth being shimosa. The Shinano (216 m.) waters the plain of Echigo, flows into the sea of J., and is navigable for about 90 m. Most of the rive. are short, rapid, and shallow, caining depth when the snows are melting; they are freely used for electric purposes and whenever possible for transport. The lakes of J. are numerous. They are very beautiful, the largest being Biwa in the centre of Honshin, about 180 m. in cir. centre or Honshin, about 180 m. in circumference; it possesses eight views of wonderful beauty and is much loved by the Jap. Lake Suwa in Shinano is also celebrated for its beauty. The cight lakes at the foot of the slopes of Fuji-yama are

popular resorts for both foreigners and Jap,
The geological basis of the is, consists
of granite, syenite, and diorite, granite
everywhere predominating; the granite
is not siways pure, e.g. in the valleys of
Nikko a granite-porphyry is found with orystals, felspar, and quartz, etc. The soil is usually workable and prolific, and along the banks of the rive fertile and well adapted for the cultivation of rice. climate necessarily varies in different parts of the empire owing to the long extension of the is. Its general characteristics are best and moisture through the short, bright summer, followed by long, cold. fine winters. There are three wet seasons, the first from the middle of April to the begin-ning of May, the second from the middle of June to the beginning of July, and the third from Sept. to early in Oct. In the more mountainous dists, of the is, the snowfall during the winter is very deep. lotus his during the summer months J. is, rather a wet country, and although covers the lakes and rive. with its delicate

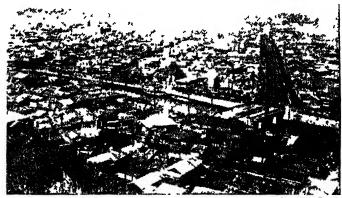

the brilliant sunsine assure in making a healthy climate, bad fogs are prevalent even during the summer. The typhoon, or great wind, is a terrible visitor, especially during Sept., though few months exape one exhibition of its force. The equivalent of nearly \$2,000,000 sterling has been expended in one year for damages caused by the typhoon, including the destruction of shore vite. Tooks, combanks are the statement of the state destruction of ships, vils., roads, embank-ments, and bridges, etc. The is. also suffer from frequent earthquakes, accompanied by tidal waves which claim thousands of human victims. In 1923 a terrible earthquake occurred in which nearly 150,000 people were killed in Tokyo and Yokohama, and the damage done was estimated to cost about five billion yen. This was followed on May 21, 1925, by an carthquake at Kiebe in which numbers of people were killed, and shocks were also experienced in 1929 (see under Exerti-gurkir). An earthquake which, accom-panied by a 7 ft tidal wave, struck central I and the is. of Shikoku on Dec. 21, 1946, was almost as severe as the earthquake of 1923, but the casualties were only 680 dead, and 4819 houses were destroyed.

Flora.—J. has a great and beautiful variety of vegetation, the colours of the foliage in spring and autumn being unsurpassed in richness and range of shades. Many Eng gardens have gained in beauty by the brilliantly coloured shrubs brought tron J. Oaks, laurel, confers, walnuts, buch, chestnut, an phor trees, and especially the weeping willow and maple grow neely, while everywhere the bamboo is seen growing in beautiful is seen growing in beautiful clumps. Among the quoons of the flowering trees the plum must come first, so graceful in its growth and if its profusion of beautiful blossom and so wonderful in its richly coloured foliage. The cherry tree is even more beloved by the natives, who stand among the world's greatest and most artistic gardeners. The peach tree also the peach tree analysis profusion, but all these three, the plum, the cherry, and the peach, bear only blossoms and no fruit worth mentioning. The Jap. pyrus, or pear tree, and the malus, or apple tree, have become familiar to Eng. gardeners, and are much prized for their gay colouring and cloud of blossoms; among the apple varieties the Florizanda is especially hardy and beautiful. The magnoin blooms in great perfection, also the azalea, chrysanthemum, peonles, iris, hydrangea, camella, gum cistus, etc. We owe many of our most graceful and brightly coloured shrubs and flowers to Jan gardeners. As a race they love the art of gardening, and at no time is the country devoid of blossoms of some kind. Their landscape and water-gardens are creations of brauty, and the miniature, or toy gardens, are an astonishing example of patient care and study. In fascinating little places a perfect tree such as a cedar may be a hundred years old vet dwarfed to attain only a few in. in height, though perfectly complete in its proportions. Lilles grow wild in great variety, and the lotus by during the summer months

Ferns are found everywhere in great quantities; there are over 150 different species. The chief fruits are the ont species The chief fruits are the orange, knape, pear, apple, lequat, peach, raspberry, and persimmen; they are, however, often rather tasteless and inclined to be tough. Vegetables are well cultivated, and many curious and palatable roots have been introduced from J. to Europe during recent years.

Fauna.—There are sev. kinds of wild animals. The black bear is found in Hondo and the brown bear in Yezo, the loe bear is an occasional visitor, carried

are a very few turtles (highly valued when are a very tew tirtles (nighly valued when caught), many tortoises, ten varieties of suakes, only one being venomous; lizards, frogs, toads, and newts are plentiful, and the giant salamander, which has been said to attain a length of 5 ft. Fish forms a very large part of the food of the Jap; it is wonderfully plentiful both in the sea and the tivs and lake. Among the chief are is wonderfully picturul both in the sea and the rivs and lakes. Among the chief are the bleam, perch, mullet, mackerel, haddock, and salmon. The gold carp and the gold-fish, so pilzed for their beautiful insect life, the golden and the jewel beetle, and the many kinds of brilliant butterflies of troules healty, there are seven kinds. loe bear is an occasional visitor, carried insect life, the golden and the jewel beetle, down by the Arctic current. Badgers and and the many kinds of brilliant butterflies foxes are numerous and are credited with of tropical beauty, there are seven kinds

supernatural powers; monkeys abound all over the is, there are no rabbits, but bares are plentiful. Wild boars and stags, also autolopes, exist in the mountainous dists., otters and sea otters are numerous and much valued for their fur The squirrel and the rat are very common, but there are no mice The bird life carries a there are no inice in the outline carries a water cross and invitates of sarrimps whose large variety, water fowl is very plentiful, wild get so, ducks, teal, and herous, especially the silver heron (belowed by Jap artists), are seen in large numbers, also the kite, falcon, and spiritow hawk. Among the game birds the commonest are the ptermigan, unipe, plover, quail, wood cock, and pheasant; there are two varieties of the latter, one known as the copper pheasant, heing remarkable for its beautiful plumage. Eagles have here found but recently in small quantities. The crane is a sar are bird, heing honourd as an emblem of longevity. Among the smaller but the tyursu comes first, a species of nightingale gifted with a very beautiful song. The cukeoo, lark hoopee, blue-bird, starling, wren, kingfisher, and various linches, etc., are all inhabs, of the is. Among the thirty species of reptiles. blarge variety, water fowl is very plentiful, wild get so, ducks, teal, and herons, especially the silver heron (beloved by Jap

of silk moths and from the ecocon of the moth (alyula Japonica, fishing lines are menufactured. The singing cricket and the cleads are common everywhere, also beautiful dragon files. Spiders abound and attain gigantic proportions. In the makes and rivs, live many kinds of fresh water crabs and myriads of shrimps which are largely used for food.

and centres of foreign trade. The present pop of I consists of two distinct in es the Afnus (or Ainos), and the Jap The Afnus are probably the original race of the n am is, Hondo Evidence of another primitive people has been found so call dipit dwellers who dug pits in the earth and roofed them over to live in The Important from the Korean and Chinese The main part of the race is short or stature and very musular but many types are distinguishable, the most important being an element of the Valav then follow the Manchu Kor in type the Monkol and lastiv the Airu in the Stature and representation of the received the Monkol and lastiv the Airu in the Stature and representation of the received the Monkol and lastiv the Airu in the Stature and representation of the received the Monkol and lastiv the Airu in the Stature and representation of the received the Monkol and lastiv the Airu in the Stature and representation of the Monkol and lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and Lastiv the Airu in the Stature and representations and the Monkol and the Monk Ainus (or Ainos), and the Jap | the Ainus Moncol and lastly the Alt u. In the schope people are more refined in appearance and the women faccording to W. ideas) are frequently beautiful while turther S. the tendency to prominent checkbones and flat noses becomes more obvious. I how are straight haired and usually very dark. As a race they are an exceedingly happy light hearted people. Children occupy an important place in every family. I has been called rightly the paradise of children. The present condition of comment is based upon the principle of equality of sexes As a wife and mother the Jap woman enjoys a position of free equality of sexes As a wik and mother the lap woman enjoys a position of free dom and respect. If single she may and often does, adopt children and becomes 'house head' of her legal family. The general character of the lap woman is especially worthy of mention they are unselfish, modest, kind hearted and patient, obedient as daughters faithful as wives, and devoted as mothers. Both men and women are by nature frugal and industrious and share in a na nonate love. industrious and share in a 1 a 10nate love of then country

Religion — There is the dute religious treedom in J. The original religion of J is Shinto (the divine way) a mixture of nature worship and ancestor worship It regards human people as naturally vir tuous being descended from the gods and regards numen people as naturally virtuous being descended from the gods and assumes that an individual sconecime is his true guide. The dead are ghosts in habiting a world of darkness with the power of bringing sorrow or joy into the living. There are more ungerous gods and goddesses with sy be nutful and charming legends attact to them. The prin divinity is Amateram the god dess of the sun. Her shute at less is visited by crowds of pilgrims. There appears to be no definite idea of what kind of life continues after death, but the cult expects natural purity of his without promises of reward. Buddhi in reached J. (552 A.D.) through Kores and the two religions became so interinical it was difficult to disentangle them. Buddhium however, gradually absorbed the greater part of Shinto, though divided into various sects. In 1940 there were 3081 Christian preschers in J., and 2104 Christian churchs belonging to various demoninations. The Rom. (atholic Church was recognised in vasited by crowds of pilgrins. There appears to be no definite idea of what kind of life continues after death, I in the cult expects natural purity of his without promises of reward. Buddhi in reached J. (552 A D) through Kora and the two religious became so interinized it was difficult to disentangle them. Buddhism however, gradually absorbed the grater part of Shinto, though divided into various sects. The fishing industry is of very great importance. The value of it to the ting innuity patually varies but rough it has rached 327 292 000 year for raw 1 inne produce and 181 204 000 year for 1 inufactured. The industry of salt

what they are. Rice is, of course, the chief crop; it forms the prin. food of the people, and is also the basis of the national drink, saki. It is a summer crop, harvested in Sept.; the fields are itooded while the grain is young and then drained. The following are the chief products, the area under cultivation, and the production in metric tons, for 1938: rice, 3,248,000 hectares (9,633,000 notric tons); wheat, 731,000 hectares (1,388,000 metric tons); barley, 361,000 hectares (778,000 metric tons); barley, 361,000 hectures (778,000 metric tons); rye, 418,000 hoctares (738,000 metric tons); tohacco, 35,200 hoctares (64,000 metric tons); and tea, 40,500 hectares (55,000 metric tons). Other im-portant crops are millet, small red beans, buckwheat, rape seed, potato, sweet potatoes, indigo, hemp, sugar-cane, and poppermint, etc. The naper mulberry is extensively grown, its fibrous tissue belief peppermint, etc. The naper mulberry is extensively grown, its fibrous tissue being the chief material used for Jap. paper. Barley is grown with particular care as it provides the material for straw-plaits, which is an important manuf. Stockbreeding is not extensive, pastureland being scarce. The growing liking for beef among the people before 1941 diminished the indigenous cai', but various foreign breeds were imported. Sheep and pigs were on the increase but the natives prefer host. Oasts are kent for their milk. The beet. Coats are kept for their milk. The rearing of silk-worms as a very important rearing of silk-worms is a very important asset to the small farmer. Jap. silk had long been famous. The chief silk-producing prefectures are Nagano, Gumma, Yananashi, Fukushma, Aichi, and Saitama; thousands of families are engaged in its production and manuf. In 1940 the total number of cocoons obtained was 43.888 400 keeps, a board at 500 400 form. 43,868,000 kwan, valued at 500,499,000 yen. The total raw sik produced in 1937 was 41,875 metric tons. The production was 41,875 metric tons. The production of rayon in 1938 was 199,876,000 lbs. and exports of rayon varu in 1938 were 21,984,000 lbs. valued at 17.845,000 yen. Radways and communications.— Rail-

ways made rapid strides before the Second World War. There sie now 15,254 m. of world war. There are now 15,254 in. or railroad, chiefly owned by the State. The first line ran between Yokohama and Tokyo, opened in 1872. After the war with Russia in 1901 the state nationalised the railways, and the growth and perfec-tion of the system was still in evolution up to the war. It was decided, before the war, to make the standard gauge 4 ft. 81 in. The work was expected to be com-84 in. The work was expected to be com-pleted in 1943, at a cost of 1408 million yen. Comprehensive plans were also made for the electrification of the state railways. The postal service is modelled on W. lines, and J. became a member of the inter-national postal union in 1877. In 1938, 4,763,778,000 letters, postcards and newspapers and periodicels were sent and 80,529,000 parcels. There were 14,331 telegraph and post offices in 1938. Telegraphic communication commenced in 1867; much trouble occurred with the more ignorant section of the public who persisted in believing it was an evil thing. power with the consent of the Imperial In 1884 J. joined the telegraphic union. Diet, which consisted of two Houses, and in 1938, 78,992,000 telegrams were liouse of Peers and House of Representation. The telephone was adopted in tives. The House of Peers consisted of

hard living have made the rich rice fields | 1877, a year after it was invented. Before 1877, a year after it was invented. Before the war there were 981,936 subscribers and 83.641 line m. Roads in J. are divided into three classes: state roads, prefertural roads, and vil. roads. They are generally well kept, and the gov. gave an ann. grant for assisting their upkeep and improvement. The first electric tramway was constructed in Kyoto in 1895. Before the war there were sev electric really war. the war there were sev. electric railways and tramways running in the larger cities. Urainage improved rapidly, the usual W. methods of street scavenging being emploved in all the tas, and cities. Crema-tion is encouraged with much success, and crematoria have been estab. in Tokyo and Otaka: other like places have been arranged all over the empire.

Fire Year Plan for Japan.—Evidence of J.'s determination to restore her shattored economy was afforded by a five-year Lared economy was afforded by a five-year plan for national reliabilitation pub. in Sept. 1945 by the National Land Bureau of the ministry of the interior. The plan envisages the redistribution within J.'s reduced ter of a pop. estimated to reach 80.000,000 by 1950, the greater production of foodstuffs, the reorganisation and redis-tribution of industries the reduction in the of foodstuffs, the reorganisation and redistribution of industries, the reduction in the number of unemployed and the restoration of devastated cities. Of the estimated working pop. of 38,000,000, some 164 million are to be engaged in agriculture and torestry, 600,000 in ishery, 6,300,000 in industry (making a reduction of 3,000,000 compared with the war years), 7,100,000 on building and road-making, and 5,000,000 in commerce. This leaves 24 million nor moloyed but they are exand 5,000,000 in ommerce. This leaves 24 million unemployed, but they are expected to be absorbed as reconstruction progresses. J.'s urb. pop. is not to exceed 30 000,000. The remaining 50,000,000 are to be restricted to the farming, fishing, and mining vils. To support this pop. 57,000,000 koku of rice will be required on the base of an ann consumption of 57,000,000 koku of rice will be required on the basis of an ann. consumption of 1 02 koku per capita (one koku equals about 5 bushels). J.'s cultivated area, which in 1911 was about 6,000,000 chobu one chobu equals 21 ars.), is to be increased to 7,500,000 chobu by 1950. The and then under cultivation should produce 70,000,000 koku of rice, leaving 17,000,000 to be imported. No permant undertied also could be made area. nent industrial plan could be made pend-ing the decision of the Allies on reparations and on the amount of industrial produc-

and on the amount of industrial produc-tion to be permitted. Constitution and government.—From the accession of the Emperor Jimmu in 660 B.C. until 1889, the country was ruled by an absolute monarchy, but in 1889 the emperor, after much study of the gov. of other countries, gave J. its pre-1945 (or Meyi') constitution. The emperor, called by foreigness the 'Mikado,' and by his subjects 'Tenshi,' then possessed the nights of sovereignty and had exceptive power. He was assisted by Cabinet minis-He was assisted by Cabinet minisiers chosen by himself. He was also advised on important state matters by a privy council, and exercised legislative power with the consent of the Imperial Diet, which consisted of two Houses,

(1) male members of the Imperial family of full age. (2) princes and marquises over 30 years of age. (3) counts, viscounts and barons over 30 years of age nominated by the emperor for meritorious services and erudition, (5) members of the Imperial Academy of Sciences and (6) representatives of the highest taxpayors nominated by their own class. General manhood suffrage came into force in 1925, under which, in principle, all male subjects over 25 years of age are electors, and those over 30 years are eligible for election. By a subsequent law, the number of the House of Representatives was fixed at 466. The 'Meiji Constitution' was super-soded in 1946 by a new draft (onstitution much more in harmony with the concepts of W. democracy. (See below under History.—Japan's new epoch.) Women suffrage had not come into heing in J. before the war, but women were taking an increasing interest in social work and politics. Voting is by secret ballot. For local gov., J is divided into municipalities. Modern jurisdiotion has been introduced. There were (1941) 51 prisons and 104 detached prisons. The courts of justice are classed as: dist. courts, local courts, courts of appeal, and the court of cassation or supreme court.

supreme court.

Commerce.—Immediately before the Second World War J's shipping industry was well on the increase. Her exports grew in bulk annually, having increased fourfold in the last few years preceding 1941. The chief were slik, cotton, grain, and seeds, tea, and marine products, etc. The United States and China took the bulk of these, followed by Britain, while India bought two-thirds of the raw cotton. The export programme for 1946 permitted by the Supreme Allied Commander was to the value of 200,000,000 dollars, or about 25 per cent of the value of exports in the years 1934 1939. The chief imports were raw cotton from India U.S.A., Egypt, and China, wheat from Canada. Australia, and U.S.A., wool from Australia; rubber from Brit Maiaya; orleake from Kwantung Prov. and China; immber from U.S.A., and piece goods, woollens, drugs, notals, rails, machinery fertilisers, locomotives, etc from the U.S.A. and Europe. Sugar is mainly imported from the Dutch & Indies, Formosa and the Philippines; kerosene from America and the Dutch & Indies, Formosa and rice from India, Fr. Indo-China, Korea and rice from India, Fr. Indo-China, Korea and the Buste from China and Korea and rice from India, Fr. Indo-China, Korea ends, cotton fabrics, cotton yarns, tea, knitted goods, camphor, straw plaits, refined sugar, coal, porceluin, matches, earthenware, paper, glass and toys. The number of galling ships engaged in trade before the war was 15,886 and the number of mercantile steamers was about 3600 Yokoham is the prin. commercial port, Kobe comes next in importance, then Osaka and Moji. among other ports are Shimonoseki, Tsuruga, Otaru, and Nagasaki (the lest-named largely destroyed in the war).

Education.—Elementary education is free and compulsory for children from six to fourteen years of age. There were before the Second World War 25,840 elementary schools and a considerable number of high schools, army and navy schools, and departmental schools, which included the study of communications, marino industry, agriculture, and commerce. There are over 12,000,000 children in the elementary schools. High schools are also State-aided, and prepare for a three years' course at the Univs. There are high schools for girls, whose education is nearly as well looked after as that of the boys. There are also logal

A STRAKT IN KYOTO

schools and private schools of general institution, and higher schools and certain colleges for girls, both technical and industrial. There are kindergarten schools for the little children of three years of age, but these are not compulsory or part of the national system. There are six State Ums - Tokyo (2), Kyoto, Yohoku (at Sendal), Hokkaido and Klushiu (at Fukuoka), beides five medical univs.

inny.—From the twelfth century till the great revolution of the middle of the macteenth century the fighting power was restricted to a hereditary military caste, the samurai or bush, whose hist, rise, and fall, is sketched in the section History below. Their weapons were the bow, the single-edged curved sword, and spear. The armour was of a special type which lasted unchanged till 1871. A combination of metal plates and scales sewn on leather, often highly decorated with elaborate embroidery, damascening, etc., if thing like a lones expeen over the body of the wearer rendering him in appearance bulky and unwieldy. The samurai served as foudal retainers of the great families. Finally the great Taria and Minamoto families predominated, and on the fall of the former the Minamotoe became the chief military power. The abolition of the samurai, the introduction of firearms.

following on the disasters of foreign interference, brought about a remodelling of with citizen (heimiu, commoner) army on W. lines. Furtively attacked in 1862, the problem was solved in various stages, with military schools, with three years' service with the colours, and four in the reserve, and organisation in military dists. By 1876 the army on a war footing reached nearly 50 000 and in 1877 engesytelly. nearly 50,000, and in 1877 successfully met the Satsuma rebellion and defeated the old samural. The evolution of the army progressed rapidly, and the Sino-Jap. War tested the capacities of the new force; in the Jap. expedition to Pekin in 1900 yelucible legency are in termed. The 1900 valuable lessons were learned. The Russian war saw 800,000 troops in the field. Improvements followed, and by the Imperial ordinance of 1909 the military forces were to consist of the Active Army, liable to serve abroad, and the National Army, both in the reverses There were militia forces in some of the is. Service was compulsory from seventeen Service was compulsory from seventeen to forty, but embediment was deferred till twenty. Two years' service in the active army, 'geni-ki,' was compulsory for the absolutely lit, five years four months in the reserve, 'yobi,' ton years in the second 'in and two years eight months in the home defence, 'kokumin.' The normal strength of the second World War active army before the Second World War. *kokumin.* The normal surengm of the active army before he Second World War was 15,000 officers and 242,000 other ranks. The air personnel for the army numbered in 1938, 10,200 organised in 21 pursuit squadrons, 12 reconnaissance and a squadrons, 12 reconnaissance and a squadrons are squadrons and a squadrons are squadrons and a squadrons and a squadrons and a squadrons and a squadrons are squadrons and a squad numbered in 1938, 10,200 organised in 21 pursuit squadrons, 12 reconnaissance squadrons, 12 bombing squadrons and a balloon corps. The number of aeroplanes in service was 1500. For the war with China 7 classes of reserves were called up in 1938, giving the army a strength of \$350,000 after making up losses. During the 1929 campaign more than 16 divs. (over 300,000 men) were engaged in Schina. The Jap. is, were divided into military dists, corresponding to the divs. of the agray, and the dist, was the unit of of the army, and the dist. was the unit of administration as well as of territorial command. There were normally 17 divs.,
4 independent cavalry brigades, 2 independent regiments of mt. artillery, and
8 regiments of heavy field artillery. The 8 regiments of heavy field artillery. The military budget for 1941-42 amounted to 1,387,000,000 yen, exclusive of sev. appro-priations for the war with China.

Nary.—In the early days, as we know from the dread of foreign invasion and the wars with Korea and Kublai Khan, J.'s imports amounted to 2,917,000,000 yen, navy was insignificant. In 1635 the policy of isolation led the Tokugawa govto to forbid the building of any vessel capable of crossing the ocean, and the foreign taggression of the middle nineteenth century showed J. defenceless before foreign to sea-power. The nucleus of the navy was formed with a gift of two war vessels from the Dutch and Queen Victoria, and two purchased from the Dutch. Gradually a small force was organised, trained by Brit. officers under Sir Architated Jouglas. The fiest played a part in the Satsuma rehellion, and later J. began herself to build. Her first ironclad was built in England, 1878. At the opening of the war with China, the navy consisted of 28 vessels, wars with Korea and Kubki Khan, J.'s

and 29 torpedo-boats; there were no battleships, while the Chinese possessed two powerful armoured ships of the line. two powerful armoured ships of the line. The naval victories resulted in immediate building on a large scale, chiefly in Europe, and the Russian War saw her with 6 battleships, 8 armoured croisers, 44 other cruisers, and 100 destroyers and torpedobonts. The crushing defeats of the Russian navy of Port Arthur, Togo's victory in the straits of Tsushima and the part the navy played in the First World War have proved the naval power of J. in the l'actific. The statistics for 1940 gave 10 battleships, 7 aircraft carriers, 35 cruisers, 5 coast defence ships, 103 destrocters, 12 torpedo boats and 65 submarines. Under the London Treaty, which procluded the replacement of cap. Ships from 1931 to 1936, the then existing skips were to be modernised and by 1941, ships from 1931 to 1935, the then existing ships were to be modernised and by 1941, the existing cap, ships had mostly been modernised. Great secrecy had been pre-citted concerning programmes of con-struction, with the result that little was struction, with the result that little was known about the bigger warships being built immediately before the outbreak of the second World War; but probably some 5 or 6 battleships of about 45,000 tons, armed with 16-heh guns were in land in 1941. Four armoured ships of 15,000 tons with 12-in. guns were also under construction. Two large aircraft carriers, sev. cruisors, and a large number of destrovers and submarines were also of destroyers and submarines were also being completed. The active personnel numbered 107,000. The gross amount of the naval estimates for 1911-42 was

the naval estimates for 1941-42 was 1241 nillion yen.

I mance.—The ordinary revenue for the year 1944-45 was 14,083,000,000 ven and the extraordinary 36,884,000,000 yen; ordinary expenditure, 20,173,000,000 yen; extraordinary, 30,794,000,000 yen; total invenue and expenditure balanced at 50,967,000,000 yen. The internal debt are at Feb. 28, 1944) was: Consulidated, 72,856,000,000 yen; floating, 1,909,000,000 yen; total '74,765,000,000 yen. The external debt (March 31, 1943) was stated at 1,222,000,000 yen (the external debt anage value at 1.222,000,000 yen (the ex) ange value of the yen in London in 1941 averaged 1s. 24d.). Prin. sources of the revenue before the war were in one tax, land tax, liquot tax, business tax, sugar excise, and tax on consumption of textile fabrics. J. was a protected country and collected a large revenue from customs. In 1939, her imports amounted to 2,917,001,000 yen, and her exports to 3,576,000,000 yen.

are handed down from mother to daughter. Their hair is very carefully dressed and piled with combs and flowers. The children are gaily drossed in the same fashion as their parents. The chief food of the country is rice, and this is served at all three meals, cooked in various wave with fish, eggs, vegetables, and many kinds of pickles. Soups made of fish, vegetables, or obestnute are popular. (hopsticks are used instead of knives and forks. The drink called saki made from formented rice is a favourite beverage; large quantitles of tea are drunk, and the cere-monies attending tea-parties, etc., are both auct. and interesting. The tea-ceremony is believed to have been introduced into J. from China, A.D. 805, and the drinking of tea appears to have started as a more or less religious institution among the Buddhist priests; about 1330 it was adopted by the Daimyos and wealthy nobles. At their famous tea-parties each guest had to guess where the tea they drank had been produced, and if they guessed right they were given one of the valuable presents which adorned the room where they were entertained. These gifts, often rare and beautiful, would afterwards orten rare and beautiful, would afterwards be presented to the singing and daucing girls who entertained the tea-party. It became an exaggerated craze among the upper classes, and was carried to such an extraordinary length that even large fortunes were dissipated. The tea is made in many forms; in one, the leaves are reduced to a powder and the liquid appears as thick as some; another thinner nivture. as thick as soup; another thinner mixture is known as usu-cha. The drinking of teu is even to-day always formal and ceremonious, and each action and gesture is arranged by a code of rules. The usual method of getting about the tas. is in a finrikisha, or little cart pulled by a man, who charges so much a m. Everyone, men. women and children, bathes frequently, some sev. times a day. In the winter the hot baths help to keep the people warm, especially the children, who are accus-tomed to being bathed sometimes five or six times in one day. In Tokyo there are over 800 public baths. The geisha or singing girls are a class well known to the European both in literature and drama. They are usually apprenticed in their seventh year and can raicly reach indesevenin year and can rately reach inde-pendence unless they marry. At one time few Jap. social gatherings would have been considered complete without these pleasing entertainers, but the custom is now dying out under the influence of modern W. styles of entertainment; Language and Literature. - With the ex-

Language and Literature.—With the exception of that of the Luchul Is., no other
language claims relationship to the Jap.
Some authorities include it in the 'Aitaio group'; it is an agglutinative
tongue. Many chinese words are employed, especially for new words, such as
bioyule. It is exceedingly difficult to
learn, and a great deal of Chinese must be
understood as well. There are practically

shirt and a kimono, kept in place by a narrow belt over which is worn the big sash or abi. The materials are usually costly and beautifully embroidered and are handed down from mother to daughter. Their hair is very carefully dressed and piled with combs and flowors. The children are gaily dressed in the same fashion as their parents. The chief food of the country is rice, and this is served at all pulsory in the high schools.

The carliest book we know of is the Koriki (Record of Anct. Matters), A.D. 712. It contains a story of the creation and the heavenly birth of the Jap. race, with a hist, of some of the early emperors, with ser, songs included; nuch of it is dull and crude. The next book, written a.D. 720, is the Nihongi (Chronicles of J.). It was written entirely in Chinese, and from that time most of the literature was pub. in Chinese, Another book about a 750. Another book about A.D. 760, Chineso. tuniese. Another book about A.D. 780, is called the Manyoshiu, or Collection of the Myriad Laures, an anthology of the anct. poems. There are sev. hists., notably anct. poems. There are so that books, and the Nihon Guaishi, a few law books, and a great deal of poetry. The classical a great deal of poetry. The classical romances are exceedingly charming, such as the fairy story entitled Taktori Monogolan, etc. Among the diaries is one called Murasaki Shikibu Niki, written by a Jap. authoress, and very difficult to read. Women have always largely influenced the literature of the country, and have added many works of merit and charm. During the time of peace under the rule of the Tokugawa Shoguns, philosophy was much studied, while popular romances and drama became common. They were, how-ever, mainly influenced by the Chinese, and were often extravagant and horrible, They were, howbut not a few were realistic and humorous. but hat a few were reaustic and minimorous.

After the Restoration an enormous quantity of Eng. and Fr. works were trans, and pub., naturally influencing the literature of the time. Of the modern authors there are four who should be mentioned: Roban Koda, Futabel Hasegawa, Ogai Mori, a king the modern who should the mentioned in the control of the c surgeon-general, and Ichiyo Higuchi who borders on genius in her life-like tales; she died very young; her stories were filled with charm and true to real life.

filled with charm and true to real life.
Lafer writers of the twentesth century
who may be mentioned are Mushakji,
Arishuma, Shiga, Nagayo, Negami, and
Nakajo; the naturalistic writers Oguri
Tayo, Kosurga Tagal, Yanagawa Shunyo,
and Ozaki Koyo and Koyo and Kunikida
Doppo (d. 1908), Tosan, Masamune, Shimamura, Shimazaki, Iwana, and Tokuda, who
are all writers of the naturalistic school.
There were, before the Second World War,
sev. newspapers and jours., and some Jap.
newspapers printed in King. Yokohama
produced the first dally paper, 1871, also
the in-t Eng. Jour., The Japan Mail, 1865.
The Jap. Fress was unfortunately hampered by vigorous conforship. The No
plays are the classical drama of J. Historical dramas and comodies of contemporary
life are the most popular, and many
European works have been trans, and
adapted Tsubouchi is a twentieth century
dramatist of repute. For greater detail
see Drama. Jap. music is at present in
its infancy, and to the sers of Europeans
seems neither pleasant nor melodious.

Art .- The architecture of the country has never attained the great or grand; small things are made perfectly in J., but not so often very large things. Quaint grace and wonderful curves may be met. but no wonderfully proportioned and im-Quaint pressive building greets the stranger; no domes or minarets, or mussive structures, but lightly-built houses and temples of wood and thatch, or sometimes tiled roofs. Walls are scarce, the sides and divs. of houses being of opaque paper screens, re-placed in winter by wooden doors that slide into their places. Even the great temples are composed of wood and mutting, the wood carving being wonderful and beautiful. The view of a tn. from a height appears extraordinarily that and uniform, only an occasional pagoda rearing its beautiful head among the trees. The Jap. architect excels in beautiful detail. In rebuilding the cities that were destroyed by earthquakes J. is following, to a considerable extent, the W. form of architecture. The few concrete buildings that have been in existence in J. for some time have withstood shocks fairly well.

Jap. art is essentially realistic, almost impressionist. Studies from nature are perfect and alice. The art of painting has existed in J. for twelve centuries. Since 1897, when national treasures became proreal art of the nation has become better known. The oldest painting of whose existence we know is a mural decoration in the hall of the temple of Horyusi, near Nara, attributed to a Koreau priest named Doncho about the sixth contury. It clearly shows the colouring and construc-tion of a late example of Buddhist art The first famous native artist of whom we Kanaoka, at the court of the Empetor Sciwa, about v.D. 850; very few of his works have survived, and those that have are chiefly conventional in design, but most perfect in their blending of colours His descendants who continued to the close of the fifteenth century were famous artists, and founded the native school of Wagwa-ryu: the followers of this particular branch of puinting delighted in quaint animals and insects, such as grass hoppers, from, butterflies, and hobgoblins, etc., which they represented with extra ordinary charm and vitality. During the During the ornmary enerm and visitor. During the fifteenth century two Buddhist priests be came very famous, Cho Denshu and Josetsu. The former painted religious subjects, and the latter landscapes and figures. A little later came Kano Mass sobu, probably a follower of the Tosa or Yamato-ryu school and believed to be the Yamato-ryu school and believed to be the pupil of Jostsu, who also instructed Shubun and Sesshu. These three became the leaders of three fumous schools of painting. The Kano school has ontlived the other two: it is still followed to-day, with its generous breadth of idea, its extreme simplicity, and its brilliant colour schames.

and illustrated books. About 1775 Okyo became fumous for his representations of animal life. Following the Kano school came Ogata Korin (d. 1716), a man who left his eccentric and vivid influence on the works of his many pupils: he also excelled in hequer work. The year 1889 saw the last of the old schools; Ryosa, whose favourite themes were ghosts and skeletons, ended the anet, traditions. The W. skyle of palning is gaining influence in W. style of painting is gaining influence in J. but so far no Jap. artist painting in this style has produced any work of outstandlug merit

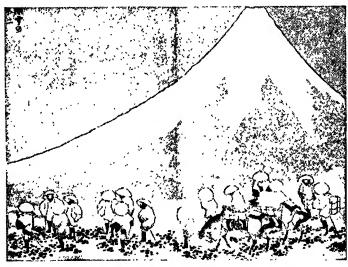

culpture and carving in metal and wood have been a highly developed art in 1 for twelve centuries; many of the templey are store-house; of fine examples, going back as far as the sixth century. sacred images were not the only subjects for the glyptic art, bells, vases, candlesticks, latterns, arms, and armour, all being objects for the artist's skill. Stone was never used to any extent, but brouze, Near, and wood have always been em-plosed from the earliest times. The most patter anet, bronze is the image of Bhaicha diyaguru in the temple at Nara One of the most famous of the country's sculptors was Hidari Jingoro (d, 1634) Some of his chief works were the gateway of the temple at Kyoto and the decorations of the manusleum of Iyeyasu at Nikko. The elaborate metalwork of the sword hilts, when every noble and samurai corned a sword, was for over 460 years a sonderful work of art. Whole families became sword sculptors, and many of these were head in great esteem, while the syords themselves were handed down as tamily heirlooms. The art of inlaying with gold and silver became highly developed at a very early time. A great hal of their bronze work is very fine; one particular kind which colours to a golden particular kind which colours to a golden vellow is remarkable to a degree, and the Jap have excelled in this particular branch of metalwork. The common domestic flower vasca, alcove ornaments, and incense burners are often of exceeding beauty of design and workmanship. The great Brouze Buddha at Nara, and the huge Amida at Kama-Kura, are a proof of their early skill in casting large objects. their early skill in casting large objects. Another branch of art grew quickly with the use of tobacco, and this was the carving of netrake, or buttons employed to suspend the tobacco pouch from the girdle, also the bowl of the pipe and the pouch clasps. I ollowing the netsuke came the okimono, httle ornaments, wouderful copies of cray-fish, dragons, eagles, birds, and the like; some were of large size, but many of the most perfect are tiny little productions to delight either an artist or a child. Woodcarving has, from very anot. days, been one of J.'s greatest arts. The temples bear the records of centuries of exquisite work, but seldom the names of the artists. The smaller wooden figures of the Buddha, treme simplicity, and its brilliant colour schemes.

A new development of art began with such placid faces, in folded drapery, with lotus petals carred for their canopy. Hishikgawa Moronobu (d. 1713); his pictures are filled with delicate work; he jap, wood-carver. The art of the woodgave J, her first beautiful wood-engravings was used for the printing of texts and pictures. The name of Hokusai Nakajima Tet-Sujiro (d. 1849) is well-known in this field; his thirty-six views of Mt. Fuji are of remarkable beauty. He illustrated numberless books, and represented both animal and vegetable life with accuracy and viyidness. He was followed by Hivoand vividness. He was followed by Hiro-shige (1797-1858), who depicted every aspect of his country in numerous sets of prints.

The art of lacquering was a gift from China at the beginning of the sixth century. Plain black lacquer was the first Befor achievement, later mother-of-pearl and hist.

feather, or feature makes their produc-tions anything but impressionist. Their whole art, just as the real national character, stands out for perfection in one main object and disregard of all superfluities.

-The racial origin of the Jap. History.people is still a matter of dispute. anct, chronicles of the country tell that anct. chronicles of the country tell that the god Ninigi descended on an E. peak of the mt. Kirishimayama, on the is. Kyushu, as the forerunner of their first emperor named Jimmu, about 660 B.C. Before this date they have no written hist. The Ainu, or Ainos, appear to have

ONE OF THE FAMOUS VIEWS OF MOUNT FUJI BY HOKUSAI

gold dust decorated the work, followed by gold dust decorated the work, followed by conventional patterns, and still lator by floral designs of great beauty. The interior of the temples and castles were adorned with the most elaborate lacquer work. In all the finer examples of this art gold predominates, and the effect is rich and soft. Enamelling is another development of the modern Jap, artist. Toverbment of the modern Jap. artist. Today vases, bowls, censers, etc. can be
obtained in the finest cloisonné enamel
translucent enamels are
wonderfully decorative, both in delicate
design and exquisite colouring.

According to a survey carried out by Allied H.Q. only 38 of J.'s 5703 greatest national art objects were damaged or desworld War. Jap. art must always appear different from the art of other countries; in one sense it is impressionist by reason of its choice of subjects and want

been the inhabs, of J. when the present people migrated from the adjacent continent, though which part they came from is not proved. The Ainu came from Siberla, and they appear to have found a siberia, and they appear to have found a primitive aboriginal tribe who dwelt in pits and who had been (if they were not then) cannibals. The Ainu drove these people N. and estab. themselves on the main part of the is., but there are not many left now. They were formerly a flerce race, but centuries of oppression have reading of them to deponer any tess also Appren duced them to degeneracy (see also AINUS).

Of the coming of the Jap. and the first

fierce fights for supremacy very little can be written. The real known hist. begins be written. The real known hist. begins with the Emperor Jimmu Jenno; the date ascribed to his accession is 660 B.C. but it was probably later; from him all the emperors of J. are descended. In A.D. 200 a warrior empress called Jingo invaded Korea, crossing from J. with a large fleet and successfully subduing a of detailed background; yet in another large fleet and successfully subduing a sense the perfect painting of every petal, part of Korea. About A.D. 500 the inhab.

Ainu, Mongol, and Malay, ruled by one emperor. Down to 670 the records are emperor. Down to 670 the records are so vague and steeped in legend that it is impossible to say accurately what occurred. About 670 the noble family of Fujiwara became prominent. They governed as agents of the emperor, spending his revenues and oppressing the people. It became customary for the empress to be chosen from their daughters; thus the sarry training of the royal children became early training of the royal children became one of the privileges of this powerful house which, in fact, though not in mane, ruled the empire. They gave J. many scholars and state-men, but being without soldiers or money, except for the imperial revenues, they were gradually ousted by the warrior families of Taira and Minamoto. These two families were at constant war with each other. The Taira were finally exterminated by the Minamoto, about a.D. 1100. For some years after this Yortomo, the chief of the Minamoto should the average while the after this Yoritomo, the chief of the Minamoto, ruled the empire under the title of Sei-1-tai Shogun. He was merely a sacred personage during this time, and accordingly worshipped and flattered and given all he could dee're, but without power. Yoritomo dies in 1124, and the family of Hojo, who acted to the Shoguns in the same capacity that the Fujiwara had acted to the imperial family, became the most powerful. The emperor of China, Kublai Khan, demanded that J. should recognise his suzerainty (1240); on their refusal a large tleet was sent which was destroyed off the coast of Kyushu in 1231, leaving J. free. The Hojo family became enfeelled by their luxury and indolone leaving J. free. The Hojo family became enfeebled by their luxury and indolunce and an organised revolt succeeded in and an organised revolt succeded in driving it out and restoring power to the Emperor Go-Daigo, 1331, who, however, was obliged to abdicate, and fled to the 3, pursued by the soldiers of Ashikaga Takauji. Much trouble and petty warfurensued, and another branch of the imperial family supplied a sovereign; the Ashikaga family held the Shogunate till 1565. But these internal struggles reashing the state of the state o

From 1565-1600 only the strongest warriors could hold any real power, and thus it came about that a low-born groom became the first man in the empire. This man, named Hideyoshi, was noted for his ugliness, his quick wit, and his courage Be is one of the national hences of J, and artist and author have given him undving fame. One other man, Iyevasu, a coinmon soldier, a rising young member of the Tokugawa family became powerful at the same time. These two men came to the same time. These two men came to an agreement and between them over-came the remaining great warrior families oame the remaining great warrior families on the death of Hideyoshi, lyeyasu fought for the supremacy and finally gained it in the great battle of Sekigaliara. After wards he claimed the title of Shogun, and thus founded the line of Tokugawa Shoguns, following up the policy of Iyeyasu, succeeded each other undisturbed. Slowly but inevitably, howering, who ruled till 1868. Kyoto had formerly been the cap, but Iyeyasu substituted Yedo. The military families guns as reactionary and tyrannical. In

became properly one nation, a mixture of | (known as Samural) were now subject to the closest inspection; their estates and incomes were assessed by the Slogun's officials. The Daimyo or feudal chief generally held a castle occupying a commanding position. At this period the right of wearing a sword was the highest privilege, wealth was of little consideration become coverge levelty and filial tion, honour, courage, loyalty, and fillal plety ranking first in the code of ethics followed by the Samurai. The relations of the Daimyo to the Samurai corresponded to those of the medieval European baron, knight, and squire. Iyevasu estab. a military rule of the empire. He stands among the greatest of J.'s statesmen, and

among the greatest of J. a statesmen, and his system of gov, assisted greatly to increase the wealth of the country.

Under the early rule of the Tokugawa Shogana foreigners were welcomed and regular intercourse between Jap, and Europeans began in the stateenth contury. Commercial interest had commenced with the Portuguese about 1542, from whom the Jap, bought arquebuses.

The Rom. Catholic Church now sent a missionary expedition of Jesuits, headed by Francis Xavier, to J. The Jesuits were well received and made good progress with their converts, but their zeal and nergy led at last to their being denounced he governed at last to their being denounced as agritors. Some Franciscans arrived and quarrelled with the Jesuits, and following this the Dutch commenced triading with J.; they, being rigid Protectants were naturally unfriendly with both Sp. and Portuguese. The Jap., anise of at the uncellifying speciacle of all the Europeans quarrelling violently among thus pellogs, became alarmed, the creade ther welves, became alarmed, the creeds of the foreigners appearing to them merciless and fanatical. Therefore the simplest method of ouring this condition we applied: the Spaniards were expelled in 1621, the Portuguese in 1632, and the native converts who refused to give up this foreign creed were exterminated. The native converts who refused to give up this foreign creed were exterminated. The final tragedy of these ill-fated persons took place at the castle of Hara, known as the revolt of the Shima-bara. The Dutch traders were not expelled, but were subjected to severe and humiliating restrictions. No general declings with foreigners were allowed. Ocean-going ships were no longer permitted to be built. The first Firg. man to reach J. was one Wm. Adams (d. 1620). He was pilot on a Dutch trading vessel, and stress of weather drove the ship Charrity to the 1st of Kyushu. He was ship Charity to the 14. of Kyushu. He was summoned to Osaka, and Lyeyasu, appreclating his knowledge of ship-building and sups, refused to allow him to return home. He was presented with an estate at Hemi near Yokosuka, married a Jap. wife, and became known and beloved as Anjin Sama. His men.oiv is preserved by the name of a street in Yedo and an ann. festival on June 15.

1873 the United States sent Commodore Perry with four ships of war to open diplomatio relations; a Russian ship arrived in the same year on the same errand J now woke up to the folly of having isolated herself from the progress of other countries Commodore Perry made his proposal and sailed away, pur posing to return in a few months J wildly flung all her energies into feverish extempts to build forts collect traces and attempts to build forts collect troops, and build ocean going ships once more mately they agreed to Commodore Perry a demands for Amer trude and safety for shipwrecked sallors Perry showed them a model telegraph and a model railway, a motol tengraph and a more rainway, which delighted and amazed the Jap the coming of Perry and the subsequent wwakening of the country led to the downfall of the "hogunate The Daimy or were called together to advise." but they adopted the desperate attitude of resisting the foreigners by force of resisting the foreigners by force. The Shogun understood the position only too clearly he was a far sighted, able statesman his decision was to sign the treaty with Perry and further treaties with Russia, England and the Nether lands. In signing those treaties the Nether lands in signing those treaties the shogun knew that he signed his own downfall. The Dainvoy rose against him and expel the foreigner. Note the the proplet of the state of the counter of the counter of the state became the popular cry the foreigner the foreigner occame the popular cry

Daimyo of Satsum; vengence was Daimyo of Satsuma vengcince was taken for his sake the city of Kagoshima belonging to the Satsuma was bombarded and utterly destroyed. The choshu chief who commanded the entrance to the in land sea at Shimonog ki fired upon foreign ships, the empeter having given him an edict without the knowledge of the Sho gun A squadron of Brit men of wer demolshed the forts of the Choshu and destroyed his ships A fine of 3 000 000 dollars was imposed upon the Choshu his cap being in the hand of the inviders while he was in revolt against the Shogun who therefore could not collect the debt Sir Harry Parkes, intrinted with brit interests in J, arranged that part of the debt should be remitted on the ratification of the treaties. This inded the power of the hogun A foreign fieet was anchored off the entrance to the sacred city of Kyoto, where the emperor resided
That monarch dismissed the officials officials whom the Shogun had appended to carry out the negotiations, and the Shogun resigned in 1865, and was succeeded by Keth. The last of the Tokun was not take her From this time on J began to take her

right place among progressive nations. The emperor became the head in fact and not in theory In 1671 an imperial decree abolished weal autonomy the feudal system was to be a thing of the past. In

1853 the United States sent Commodore Perry with four ships of war to open diplomatio relations; a Russian ship arrived in the same year on the same errand J now woke up to the folly of having isolated herself from the progress of other countries Commodore Perry made his proposal and sailed away, pur posing to return in a few months J shope of the feudal nobles and Samurai also occasionally despatched themselves when the proposal and sailed away in the feudal nobles and Samurai also occasionally despatched themselves when the proposal part and few months of the feudal nobles and Samurai also occasionally despatched themselves when the proposal part and few months of the feudal nobles and Samurai also occasionally despatched themselves when honour or loyalty demanded it of them

The country now set herself the difficult task of thoroughly learning and practising the institutions of Furope and America. the institutions of Furope and America.

ome fifty five men by no means all noble commenced the work of reconstruction Many were murdered, some were executed and not a few broke down with overwork Among the greatest names honoured eventore by their country are Prince Ito who framed the first constitution for J and who died by the hand of a mad assessin in Korea, Saigo Pakamori, Itagaki, Okubo, and Kido The next period is known as the Midii era knellshmen were employed in knehshmen were employed in Melil era the construction of railways, telegraphs, etc. and in the organisation of the navy, Amers supervised her system of postal service also her agric arrangements and her education. I renchmen trained her solutes in modern tactics and recast the laws while Gers assisted with medical scence and local gov. In 1889 the Em-peror Mutsuhito gavo J her pro war con-4titution

The next difficulty the country had to fa (was the question of Korea, that peninsula was too close to the vital part of I to be a comfortable home for another of I to be a comfortable nome for another nation. Ching was not anyious to see Loren occupied by the Jap any more than the I tter were to see it governed by China. Matters reached a crisis in July, 1891 and war was declared between the two countries. The struggle became a succession of victories for J. First a naval encounter took place between three Chin contributions and three Jap. One Chinese ship was taken, CIM (I cruict One Chinese ship was taken, one shattered and endered usekes, and the third evenued badly damaged. The first land victory took place at Phyongyur the Chinese lost 6000 men and the Lu only 700. Then came the naval battle of the mouth of the Yalu R which prived a disastrous defeat for China. Jether wized the Chinese pages notes of proved a disastrous defeat for China, Jethen sered the Chinese naval ports of Allien Port Arthur and Weihai wei. The Chinese commander Adm Ting, committed suicide unable to bear the fanced disgrace of defeat. This was the end of the war. The treaty of Shimonowski (1890) declared korea absolutely independent, coded the Jert of Manchell Tormosa and the Pescadores, compelling China to pay 200,000,000 tacks independently. It is victory was hard won, having cost 20 000 lives and £20,000,000. The interference of the European Powers. The interference of the European Powers and her own crippled condition compelled her to give back to (hins the ter on the 1876 the pensions of the Samural were commuted and swords were forbidden to be worn. The Satsuma clan alone remained conservative and rose against the gov. (Jan ->ept 1877) in a short-lived revolt. This ended further trouble with the Sumarai, many of these men, loyal.

China were watched by J. with increasing | auxiety. In 1904 matters came to the expected crisis, and J. declared war against Russia (see Russo-Japanese against WAR). WAR). To the amazement of Europe. Russia was defeated, peace was concluded in 1905, and a froat; was signed at Potts-mouth, New Hampshire, U.S.A. In 1905 the new Anglo-Jap. treaty was signed in London for the purpose of maintaining peace in E. Asia, ensuring the integrity and independence of thing with the policy of the open door for all nations, and for mutual defence of the territorial rights of mutual defence of the ferritorial rights of the two contracting powers in the Far E and India. In 1911 this was renewed for ten years with modifications. The in-tegrity of ('hina was the basis of agree-ments with Russia and France (1907), and a common policy in regard to Far E. and Pacific questions was formulated in ident-feal notes between J. and the U.S.A. in ical notes between J. and the U.S.A. in 1908. In 1910, 1911, and 1912 agree-ments were signed with Russia in refer-

ments were signed with trusta in reter-ence to (hins, Manchura, and Mongolia. The great Emperor Mutsuhito died in 1912; he had reigned for forty-five voars. On his accession he had inherited a petty Oriontal state at leath he left his son 1912; he had related for forty-five vents. On his accession he had inherited a petty to Oriontal state at interfect a petty to Oriontal state at interfect a petty to Oriontal state at interfect and inherited a petty to Oriontal state at interfect and int him, and became known as Emperor Taisho. At the beginning of his reign, the ministry of the Marquis Saloni came to an end, being split upon the decision of the war minister, Gen. Uyehara, to keep two army divs. in Korea, where there had been a conspiracy against the Jap Governor, Count Terachi. The offer of Prince Katsuri to form a ministry was not accepted by the Lower House, and Katsuri thereupon formed a new party, called Rikken Poshi-Kai or the Constitutional Crusaders' Association, but in 1913 he died of cancer. In Feb. 1913 the Yamadied of cancer. In Feb. 1913 the Yama-moto ministry came into power, but soon after fell owing to the Naval Scandal, aroused by the fact that bribes had been accepted by Jap. officials from the Siemen-Schuckart Company over the building of a Jap. battleship. After an interval, m which Viscount Kiyoura tried in van to form a Cabinet. Count Okuma came into which Viscount Kiyoura tried in vain to form a Cabinet. Count Okuma came into power on April 14, 1914, with the assistance of the new Doshi-Kai party. Baron Kato was made foreign minister, and after the outbreak of the First World War in Aug. 1914, he enunciated the national policy that 'J. had no desire nor inclination to become involved in the present conflict. but she believed she oved it to conflict, but she believed she owed it to herself to be faithful to the Alliance (2.4 with Great Britain) and to strengthen its berself to be faithful to the Alliance (a.) laws concerning women and children were with Greet Britain) and to strengthen its foundations by ensuring permanent poach, and welfare work was instituted in the E. and protecting the special interests of the Allied Powers. On Aug. 15, Czechoslowakian army to escape from an ultimatum was issued to Germany desmitted that all Ger. battleships should be withdrawn from Jap. and Chinese

waters, and that the whole of the leased ter. of Kiao-Chiau should be delivered up by Sept. 15 and ultimately restored to China Having received no reply from Germany, J. declared war on Aug 24. On Sept. 2 the Jap. array landed in Kiao-chiau and, having been joined by a small Auglo-Indian force, commenced the siege of the forts, which, by Nov 7, surrendered. On Nov 16, the Allies occupied Tsinctau (q 1) Meanwhile the Jap fleet was active in the Pacific, destroying the prestige there of the Ger navy and capturing the Caro-lines the Marshall, and the Marianne is.

On Jan 18, 1915, J. suprised the world by Issuing to China the unwarranted Twenty-One demands (see also under Chiva). These were divided into five groups, of which the last aroused the most bitter controversy. Among other things it demanded that the Chinese should employ Jap advisers in their affairs, that the piot Jap advises in their mairs, that the Jap should have the right to build hospitals, schools, etc., in the interior, that a jointh-administered Jap, and Chinese useful should be set up, and that the control of certain railways together with the test of control to the the state of control to the state of t

By the treaty of Versallius 1919, J. t. (ceived, under mandate, the former Ger. colonies, the Caroline, Marshall, Marianne, and Pelew is, together with Kiao-Chau. The difficulty with China, resulting from this latter award, was the subject of the Pacific section of the Washington Conference (q r.). Kiao-Chau, together with other former Ger. ter. in Shantung, was returned to China, while a treaty of Naval December of the Alexandra of the Alexand Disarmament between J., Gwat Britain, France, and the U.S.A. was concluded, and. in this, the former Anglo-Jan, Alliance was merged. In domestic affairs, both during and after the War, J. was both during and after the War, J. was undergoing extremely rapid industrial development but had not escaped war profiteering, and this, coupled with the increased cost of living, caused resembnent and ricting. Before 1916 trade unions were practically unknown in J., but after that year they because increasingly powerful. Discontent appears the worker. that vear they became increasingly power-ful. Discontent among the workers tound expression in strikes, of which there were 417 in 1917 and nearly 500 in 1918. The rice riots of that year brought about the downfall of Tersucht, who had suc-ceded Okuma as head of the gov. in 1915. A new gov. was formed with Takashi Haru, a commoner, at its head. Factory Siberia suffered at the hands of the Bolsheviks, and it was not until 1923 that the Jap. commenced the evacuation of their troops.

At the Versailles Peace Conference, J sought to obtain the recognition of racial equality, but the required unanimous vote was not forthcoming. In 1923, the sym was not torcuculant. In 132, the synthety pathy and help of the world were extended to J to repair the damage caused by the terrible earthquake of that year (see supra and under EARTHQUARE). It may be mentioned here that the next serious carbonate in Large that which a true. be mentioned here that the next serious earthquake in J. was that which struck central J. and the is. of Shikoku on Dec. 21, 1946, causing damage over an area 400 m. by 150 m or about five-sixths as severe as that of 1923 In Sept. 1923, a gov. was formed by Yamamoto, after an interval of unstable ministries following the assassination of Hara on Nov 4, 1921. In Dec. of 1923, however, the attempted assassination of the Prince Regent caused Yamamoto to resign, and a new Cabinet was formed by Viscount Kiyoura. This gov. was unpopular, and Kiyoura. This gov. was unpopular, and tell the following year, owing to the resentment aroused in J by the Amei Immigration Law, passed in Mav 1924, forbidding Asiatios to enter the USA General elections were held in J at this time, and elections were held in J at this time, and Viscount Takasti Kato came into office with a gov. which was a Coalit.on between the Sevyu-Kat, or Constitutional Political Association, and the Kensei-Kai, which party had arisen out of the Doshi Kai. The prin. achievement of this gov. was in granting universal suffrage to all men over the age of twenty-five. On the death of Kato, the premiership fell to Wakatsuki On Dec. 25, 1926, the old Emperor Taisho died, and was succeeded by the Crown Prince, who had acted as Prince Regent since 1922, and now became the Emperor Hirohito. In the succeeding years, J was mainly occupied with reconstruction was mainly occupied with reconstruction at home and the rebuilding of Tokyo, and in foreign affairs with the problem of navei security. Much criticism was levelled at the foreign minister, Baron Chidehaia, on the grounds that the ratios with regard to naval strength accepted at the London Conference were inadequate for the protection of J. (see London Conference). In 1934 J gave notice of trainintion of the Washington Treaty of 1932 (see Washington Treaty of 1932 (see Washington Treaty of 1932 (see Washington Treaty of 1932). In Manchuria, excited grave apprehension (see also China—History Surerial of Japanese fendal institutions—After the middle of the nineteenth centry, when the influence of W surer and the grounds that the ratios with regard to

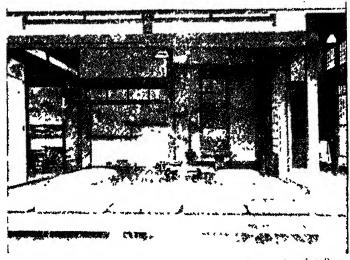

tury, when the influence of W science and technology began to infiltrate into the I ar methods of modern industry and warfaro. At the same time she attempted to carry out the so called continental policy, which contemplated the conquest of all ('hina and warfaro').

absorbed was the superficial aspects of Chinese and W. culture. Her feudal in-stitutions survived to the period of the Second World War Down to 1946 there was no social or political equality and the people were divided into strictly defined classes the royal family, the aristocrats, the variors, and the commoners. The foundation of modern or pre-1946 J. was laid during the Meli Restoration which began in 1868. The authority of the rotal family was greatly enhanced and the noble and warnor classes became the real governing classes controlling nearly all political, military, and economic power. The much extolled Meiji Restoration resulted in the oppression of the masses, whose psychology became a curious com-pound fashioned of modern industrialism and medieval feudalism, a complex essen-tially favourable to militarism from above. Military expansion followed naturally. Korea was overrun and there were easy victories over China and Russia in 1895 and 1905 After the unification of Germany under Bismarck, military training in J was a slavish imitation of the Ger. system. The Mein period also brought with it the rise of the zerbaffu, the modern Jap financial oligarchy who, like the militarists, came from the aristocratic class and who generally co-operated with the militarists in exploiting the masses and in furthering the Jan Course makes and in furthering the Jap foreign policy of expansion J's earliest modern industries were war industries. It was during the ino lap wars that the notorious Mitsul and Mitsubishi combines developed the power, controlling practically all Man hutlan enterprises and giving their support unconditionally to the all-dominant militarists Political parties were organised in this period, but this too was a movement from above and not from the puple. The founders of the parties. Taisuke Itagaki, Hirobumi Ito, and Taro Katsura came from the old aristocratic class such men had no sympathy with nor even understanding of democracy. Jan parl, institutions were a sham and corruption and bribery at elections were rife the financial oligarchy controlled the parliament, the military clique controlled the functions and the people had no voice No Jup cabinet could be formed without the consent of the Army and the Navy The war minister and the and the Navy The war minister and the minister of the navy had to be, respectively, a general and an admial on the active list, and although they were members of the cabinet they were independent of cabinet control and enjoyed direct

access to the emperor.

Japan's Manchuran adventure.—J.'s policy towards China had openly abandoned conciliation in 1931 when the military party, swamping the Liberal gov, baunched an armed adventure in Manchuria, which soon brought the entire prov. under Jap control. J.'s interven-tion in Manchuria was little more than the obvious result of a fundamental concontemplated the conquest of all China and, eventually of an unlimited portion prov. under Jap control. J.'s intervention of Asia. It is only against the background of J.'s social and political structure that her world outlook in the twentieth century can be understood, with those of Chinas. J. realised that Centuries of geographical and mental isocial control of the S. Manchurian Railway. Relying on her privileged position in Manchuria. J had invested great sums in mining and other primary resources of Manchuria-enterprises of vital importance to I.'s great home pop. Attempts to negotiate a settlement with China naturally proved abortive and the Jan. military leaders.

made suggestions for setting up a special regime in Manchuria, recognising Chinese sovereignty and, at the same time, safe-guarding J.'s rights. But J. had already set up a puppet gov. and created a new State, which she called Manchukuo; and her reply to the League was that she was a settlement with China naturally proved abortive and the Jap. military leaders, at mg in self-defone and that, in any without even consulting the Tokyo gov., there was no central gov. In China hurled their forces against the whole zone of the railway. After the disam ng of the railway. After the disam ng of the garrison at Mukden and the capture forces and, having withdrawn from the GKirlin, the Jap, authorities held the I league of Nations, her troops advanced hand, and the dispute was referred to the

Canadian Pacific

INTERIOR OF A JUNANESE HOUSE

League of Nations and the Chancellerie of Tokyo and Washington. The Leaven imposed a fine-built on J. to withdra all troops within the treaty zone, who did while insisting that the disput could be settled only by direct Smo-Lap could be settled only by dilect Sino-Lap negotations. An attempt by the Power to find a way out through the Keller Pact (q.r.) was equally unsuccessful. The Jap. gov., adopting delaying tacins, steadily pursued their conquests, and their troops, crossing the Chinese E. Rajiway, took Chinehow, the headquaters of the Chinese commander in chief. By the

out of the whole of that prov. and S. of the Great Wall.

After the occupation of Manchukuo medents of forward movement alternated with periods of relative calm. when periods of relative calm. Every succeeding year saw a further milestone on J's road to empire. Thus, in 1933, it was the final lopping of Johol, with its old Chinese imperial palaces, its coal and strategic mt. passes, from the main body of China and its incorporation in Manchukuo. In 1935 came the elimination of the last vertice of the traditione! Passets. steadily pursued their conquests, and then troops, crossing the Chinese E. Railway, took Chinese commander-in-chief. By the end of the year (1931) they had overing 200,000 sq. m., with no more than 20,000 troops. Later, a large Jap, force was landed in Shanghal, where heavy fighting began early in 1932. Meanwhite (Decombor 1931) the Lesque appointed a commission of enquiry in Manchuris under Lord Lytton, whose report (Oct. 1932) the counivance of the Jap, military authorities, of a puppet regime under Jukeng in the W. dista. of N. Ohina. Early in 1936 irregular forces, issuing from Manchukuo, drove the Chinese forces out of the prov. of Chahar, and estab. a pro-Jap. regime in that sparsely-populated ter The Jap, foreign minister (Roki Hirota) now put forward three points as essential pre-requisites of Sino-Jap, understanding co-operation in suppressing communism recognition of Manchukuo by China, and the cessation by China of all unfriendly actions in relation to J. and to the policy of 'playing off a third Power against J' The first and third were capable of the widest interpretation and could even justify J. asserting the right to supervise China's foreign relations and to send troops to any part of China where 'communist' forces might be operating.

In line with the policy of expansion on land was the denunciation by the Jap. gov. of the Washington Naval Treaty and its refused to conclude any new naval agreement except on the basis of parity with Great Britain and the U.S.A. I might be regarded, slouz with Germany and Italy at this time, as one of the three major dissatisfied or 'have-not' Fowers of the world. There is abundant statistical evidence that I is economic position was, and is to-day, that of a proletarian nation.

J. depended almost eptirely on foreign sources for such vitally important raw materials as cotton, wool, rubber, and oil, which were the life-blood of many of its chief industries; and there is no mineral of any consequence which J. possessed or or any consequence which J. possessed or possesses in surplus quantities. It would be an over-simplification to suggest that the Jap. army 'staged' the scizure of Manchuria merely as a means of restoring its shaken prestige at home and driving the shaken prestige at home and driving ilberalism and pacifism into the back-ground. Other considerations were tn-volved: the many unsettled economic disputes with the Chinese authorities the desire to push back the reviving Russian influence in the l'ur E., and the disposition of the Manchurian ruler to establish closer relations with the Nation-alist regime in China. But that the Jap. army took full advantage of the strengthened position which it acquired as a result of the outbreak of hostilities in Man-churia is unmistakable. Behind the Jap. sweep towards empire at all costs were a whole complex of impelling forces. Pan-Asianism had its part. Outside J. pan-Asianism was a negligible factor until after the Second World War, when Nationalism among colonial races became active. But if the Jap. empire was to expand further, pan-Asianism, to a certain type of Jap. mind, might become a formidable slogan. J.'s sweep towards imperial expansion was by no means purely military and territorial in character. Goods with the made in Japan mark won their victories and made their enemies, just a, the Jap soldiers on the battlefields of Manchurla and Jehol. J's advance to a commanding position on the Asiafic continent might at and Jehol. this time be graphically represented by three arrows, pointing in different quart-

ers: the first pointed N. to Manchukuo and the troubled frontiers with Russia: the second pointed W. to China, where the destiny of J. as an imperial Power might well be settled either way: and the third pointed S. to the rich tropical lands of the European Powers and America, where J.'s activities had thus far been purely commercial in character.

J. a artifice had in the lar best purely commercial in character. Japanese 'co-presperty sphere'—The attack on Pearl Harbour. 'The collapse of Holland and France in 1940 at once led to extremist demands for Jap, interven-tion in the European War and for the occupation of Dutch and Fr. E. Indian possessions. To that end the very phase East Asia, coined by the Jap, with the political implications of an E. 'Monroe doctrine,' carried its obvious menace. J. now demanded that all sundoctrine,' carried its obvious J. now demanded that all supmenace. plies passing through Fr. Indo-Chiua to the Chinese gov. at Chungking should cease and that all supplies going to Gen Chiang-kul-shek through Burma and Hong Kong should also cease. At the some time Jap. troops were moved to the 25-m. frontier of kowloon and a land blockade of the concession there was boonockade of the conversion there was no gun. These moves had their impulse in J.'a incerce desire to settle what the Jap. gov. sixled the 'China incident,' which every statement of Jap. policy admitted to be the gov.'s first pre-occupation J's forcign minister, Arita, now outlined J's conception of a new order 'united under a single sphere 'of Jap hegemons which would cover 'East Asia' and the S. reas. Thus the species of Jap 'Monroe dortrine, 'instetypressed in 1934, was now widened so as to include a vast respectful as a matter was now the content of th unspecified area which might embrace any land from Java-to Taliti. In fact, expansion southwards had long been the policy of an influential section of Japopimon, and J. had therefore steadily in crossed her share of the shipping in the S. Seas; while the war in China had, as we have seen, given a new significance to such expansion. The tone of the demands put expansion. The tone of the demands put forward in the middle of 1940 suggested that the collapse of France had encouraged the extremists and, through them, the Jap gov., to new intransigence. But the Jap gov., to new intransigence But the But theet, strongly based on Singapore, was by no means a negligible factor, and behnd the Brit. stood, if at this time somewhat equivocally, the Amer. feet, which had not been materially weakened which had not been insternally weakened by the events of the preceding months But though the Jap. gov occupied Fr Indo China (q.w.) they found themselves fully occupied in China, where the Nation-alist forces were slowly but certainly gainany torces were slowly but certainly gaming strength and coaducting, not unsuccessfully, an unremitting guerilla warfare. Yet by the end of 1941 J. had
attempted no rash move, though the new
gov. of Gon. Tojo entertained, in view of
Russia's pre-occupation with the Ger. invasion, the most grandless schemes—
schemes which the Brit. Gov. realised
might well affect India. J.'s occupation
of Fr. Indoc/thin was in realist on atmight well affect India. J.'s occupation of Fr. Indo-China was in reality an at-tempt to outflank Brits. and Amer. defences in the Far R. as a first measure

to secure dictatorial control of vast tors.

mediate threat to India from the W., and the Jap. plan for creating a new order in Asia sought to eliminate the historically estab. rights of Great Britain, the U.S.A., estab. rights of Great Britain, the U.S.A., and other W. Powers in that region and aimed at establishing a 'benevolent' political domination over China, the Philippines, Indo-China, Thailand, Maleya, the Netherlands & Indies, Burma, India, and Ceylon. This project, growing out of J.'s paintnership with the Axis Powers (see also BERLIN, PACT OT) was framed in such bitch sounding assertions as a that J. such high-sounding assertions as that J such mga-sounding assertions as that desired to see Aslatic peoples ruled by themselves; but it was also accompanied by a scheme of economic 'co-prosperity' which really meant that J. hoped to secure vast resources of raw materials in exchange for goods of her own manuf. These Jap, ambitions in Asia were, of course, closely modelled on Nazi ambitions in Europe, and were accompanied by the same cry for 'living space, the same imputation of 'encirclement,' and the same declared intention to create a new conomic system for 'liberated 'peoples. Outwardly the Jap on was to prove that the W. Powers had no right to influence Aslatio life and culture: actually the in-tention was to enable J. to become over lord of the Orient under an economic polity which would have no place for the W. Powers, uchaing even hor own Axis partners. Memorally the Brit author ties strongthened the detences in Malaya and the Brit and Aner. Govs. applied economic sanctions to J. beginning a July, 1941, with the 'freeing' of Jan neet in reply to the Jap, move against Fr Indo-China, while the Dutch authorities move it clear that they would protect their interests in the event of turther Jap adventures.

It was evident, when Gen. Tojo, a professional soldier, replaced Prince Komove as premier (Det 1941) that J. was con-templating further military activities on templating further initially activities on a scale in conformity with the principles outlined above. Tojo's gov. now began secretly to make naval and military dispositions on a most comprehensive plan, with the view of simultaneously attacking Brit, and Amer Far E. possessions at a moment most convenient for ensuring at least initial snocess. Delay would mean, in fact, giving up their dreams of foreing J.'s will on the Pacific and E. Asia and furthermore, J. a stilking power was now at its peak. Hesides these considerations, at its pouk. littler was foreign her hand in order to divert, if possible, the material aid which America was giving to the Russian armies America was gring to the investor armire with disastrous results on his Russian campaign. Tolo, therefore, sent a special envoy to Washington to join Adm Nomara, Jap. ambassador, in order to conduct mock negotiations for a settlement of outstanding differences with the united States. In the course of these negotiatious President Roosevolt sent a necessarial measure to the superpose of the personal message to the emporor of J. in

where democratic theories were taking formal declaration of war, suddenly, on root. The strengthening of the Allied Dec 7, attacked Pearl Harbour and other line in the Middle E. had removed the im-Amer. bases in the Pacific and, after this outrage on conventional diplomatic procedure, announced that J. was at war with both Great Britain and the U.S., in the W. Pacific. Both these countries promptly declared war on J.

promptly declared war on J.

The first two years of the war in the Pacific.—Soon after the attack on Pearl Harbour Jap. planes bombed and sank the great Birt. warships Prince of Wales and Repulse, thus gaining command of the sous in the S. Pacific. By the early days of 1912 they had swept through Thalland (Slam) to Burma and captured Prince, Honz Kong, and the greater part of the Birt Malay peninsula and were landing tresh troops in the Philippines. Thus in the early period of the war in the Par P., Jap. arms carried all before them. Attempts by the Allies to hold fortresses and conduct campaigns without aircraft cover failed disastronsly: Hong Kong, Malaya, and Singapore were inevitably lost in this way; and the Jap. conquered the Netherlands E. Indies. Borneo, the Philippines, the Andamans, and most of Burum and, by cutting the Burma Road (1.".) they isolated China. Only as Butain and Araerica increased their aircover was Jap, expansion stopped east-1912) followed in the next month by the buttle of Midway Is.; and westward by the defeat of air attacks on Ceylon. I hroughout 1942, however, the Jap. war took second place in the eyes of Brit. and Amer, statesmen, who were bent on in-resisting their effort against Germany as odering by far the greater danger. But by pursuing an offensive in Papua the the mainland of Australia and it was essential for the Allies to theck any further advance. Hence in a strenuous campaign over jungle and mt. terrain Australian troops repelled the invaders and captured tions and Buns, the Jap base on the N. saist of New Chima, externi uting their gerrisons. While this war o is in progress Amor, marines were landed on the large is, of Guadalcanal (q.r.) in the Solomons and captured an acodrome which the Jap. had recently constructed there. For long the Jap, fourth hard to regain the acrodrome but by Feb. 1913 the Amers, had captured the is. This provided the point d'apput for a long-drawn but effective process of 'island hopping,' which gradually pierced the far-flung outer chain of strongholds covering J. from the Pacific, a process in which the over-growing air and naval superiority of the Amers, eventually asserted itself. For some time after the Jap, had been driven out of the dalcanal no big land action was fought in the Pacific theatre, but the Amers, continued to bomb Jap. bases and, by combined sea and air operations, thwarted all Jap. efforts to rein-force their positions, especially in what is known as the battle of the Bismarck Sea' (March 1943) when J. lost ten warships, the vain hope of effecting an understand-over one hundred aircraft, and 15,000 men. ing; but the Jap. Gov., without any In the middle of 1943 the Amers. landed torces on Now Georgia, while the Australians made progress along the N. conat of New Guinea. Lae and Salamaua, the two chief Jap. bases on Now Guinea, were taken by the Australians in Sept. 1943 Rabaul, the great Jap. base in New Britain, was overcome by the Amers, at the end of the year, who were enabled to gain control through the construction of distant airfields. The first ter. takon from J., which was not a more recovery but had been in Jap. hands before the war, was the Marshall is., which gave a base for bombing Truk, in the Carolines, the greatest of J.'s Pacific bases, and continuing their westward and northward advance the Amers. by the middle of 1944, reached the Marlanas and captured the strongly fortified is, of Salnan, where at last they had secured an air-base within long-distance bombing range of both the

Philippines and of J. itself.

The last two years of the war in the Pacific.—The continual deterioration of the war situation, both for J. herself and for her ally, Germany, throughout the period of the Kolso cabinet brought that gov. down in April, 1945. Political devel opments within J. reflected events in the military and naval fields in 1344—45 Most serious of all, the Jap navy was now definitely deprived of command of the sea syen in those inner waters in which it was expected to have a great strategic advantage, so that J's shipping routes through the E. and S. China scea, and even the coasts of J. herself, were laid open to attack. This meant the breakdown of J'a original strategy, which relied on the bases in the Carolines, Marianes, Philippines, and Ryukyu Is. as 'unsinkable aircraft carriers' for covering J's maritime communications to the mainland of Asia and the Malay Archipelago and for preventing a close approach of the enemy by sea to the Jap. homeland. It meant also that J. was subjected to air attacks beaver than was expected; strong carrier-based air forces, as well as Super-Fortresses from Saipan now took part in raids, and after the Amer. capture of Iwojima in the Bonins land-based fighter aircraft were able to support the bombers and the relative invulnerability hitherto given to J by her geographical remotenoes from Alled bases was being rapidly discounted

Allied bases was being fapility discounted J.'s hope of using Burma as a springboard for invading India had been finally destroyed by the failure of the Jap thrust into Manipur in the spring of 1944 but Burma was still useful for defending the land approaches to Siam and Malaya and blocking the Burma Road supply route to China. Hence J. was prepared to fight stubbornly to hold it, and with the greater hope of success from the fact that the task of the allied leader, Adm. Mountbatters was made more difficult through the low priority for shipping and mountbatters was made more difficult through the low priority for shipping and landing caft allotted to his 5.E. Asis Command. During the winter of 1941-45 Adm. Mountbatten was restricted to an offensive campaign by land across densely forested mt. ranges between India and Burma, hampered by the most formidable difficulties of transport. But

these difficulties were overcome, largely by the aid of airborne supplies, and with the capture of Mandalay the Jap, hold on Upper Burma was broken. Again, the Ailled success at Myit you had led to the prolongation of the road from Lede to meet the old Burma Road, and it was possible once more to send forries through to China.

In striking contrast to the ship-starved offensive of the S.E. And Command of Adm. Mounthatten, the Amer. invasion of the Philippines under Gen. MacArthur was carried out with an immense concen-tration of maritime transport and newlytration of maritime transport and newly-built landing craft. Against this massive attack the Tap. had some 200,000 men in the Philippines, but they were scattered over many different is, and the native pop was either apathetic or hostile. Even in the inner waters of the archipelago movement by see between the is, was threatened by Amer air attack. For J., therefore, everything depended on victory over the Amer. fleet without command of the sea, the dispersed Jap land forces would be isolated in their various captured is It was the moment for J. to risk a naval battle and in Oct 1944 the main strength of the lap navy was de-ployed in a determined attempt to crush the Amer naval force which was covering the invasion of Leyte. The battle which ensued was a decisive defeat for the Jap The battle which and it decided the fate of the Philippines. Strategically the Amer reconquest of Manda with the naval harbour of Cavite meant that all Jap shipping routes S. of Formosa and Hong Kong were now exposed to close naval and air attack. The vast ters to W and S of the S (hina Sea overrun by the Jap since 1910 comprising Indo thua, Slam, Burma Malaya, and the Dutch E Indies, were now virtually attack from J by any cut of from J. by sea Some slight com-pensation was provided for J by the success of an offensive in S China which success of an offensive in S. China which opened a land corridor from the middle Yangtee to Indo-China, but this could be only of limited use for inilitary movements. To all intents and purposes J. lad now lost the resources of the S lands and her garrisons remaining there were simple to the stands of the stands and her garrisons remaining there were simple to the stands of the munications from Hankow 3 -westward to Indo China and southward to Canton violded overland routes valuable for Jap. continental strategy, besides defeating and dispersing large Chinese armies in Kwangsi and Kwangtung and resulting in the capture of a number of airfields constructed at great expense by the Amers. for the use of their air forces in China. The Lip, commander in chief in China responsible for this successful campaign tion II ita, was made a field-marshal and brought back to J. to be mepoctor-general of military training, and in 1915, he was appointed by the Suzuki Gov. one of the two commanders for the military defence of the Jup homeland. The Jap.

from a new direction—from the sea which the Jap. navy had formerly controlled, but controlled no longer. The Jap., now that Germany was beaton, had to prepure to defend Hong Kong, Canton, Amoy, and Shanghai against Allied seaborne invasion. They had also to prepare to defend Indo-China against attack from the sea now that the Amers. were estab. in the Philip-

pines.

pines.

For the ordinary Jap., however, and indeed for his rulers, no thentre of war could compare with the homeland in importance. For the shinkoku or 'divine land' was now threatened with invasion from the sea. The loss of Salpan had brought down the Tojo cabinet and the tears aroused by this event were soon realised in 'Super-Fortress' raids on the industrial cities of central J., including Tokyo itself. Soon the premier, Korso, had to admit the loss of Iwojima (March 21, 1945) and the Jap. navy, after its 21, 1945) and the Jap. navy, after its mauling in the Philippine waters, did not dars to go to the recue of the garrison Then Adm. Nimitz invaded Okinawa, an is, of the Rynkyu group commanding the sea approaches to Shanghei as well as to S.W. J. The air-raids by the great Amer bombers reac' da linax in March-June and with the promise of still worse to come. The gov. was petitioned to take more drastic action in the matter of shelters in Tokyo but was powerless to do more than advise everybody not needed in Tokyo to depart at once, huge areas of the cap, being now devastated.

The prospect in the spring of 1945 that Germany would be defeated confronted J. with a major problem which was at once political and strategic. For obviously with Germany out of the war, far greater forces would be available to concentrate on J. But whether to give up the outer zone of conquests from Burma to the Carolines and concentrate on the defence of the inner zone comprising J. itself, Korea, Manchuria and China, was a nores, manonuria and China, was a problem which brought extremists and moderates in sharp conflict with each other. Kolso told the Diet on March 23 that J. intended to take the offensive to retake Iwojima, Saipan, and Guadal-canal. Okinawa had not then fallen and of the other is. Yet he was unable to explain how J. could effect such a mirack if her Navy dared not venture out of ichome waters. But the extremists, often in her Naty dared not will use out of its home waters. But the extremists, often composed of the more youthful officers, could not prevail against the general staffs and the Zaibatsu or great business housewhose minds had not, of course, been de luded by the fraudulent war-time Jappropaganda. These knew, even before the end of 1944, that the tide of war had definitely turned against 1 and that it definitely turned against J. and that it would soon be a question of trying to get would soon be a question of trying to get out of the war on terms falling far shot of J.'s original ambitions. Thus, while as yet there was no question of uncondi-tional surrender, it was essential to get rid of the ultra-extremists who would bur the way to any hope of peace negotiations. on Pearl Harbour and Aug. 1945 some Therefore in April (1945) the influential 320 Jap. warships had been sunk or put groups secured the appointment as Prime out of action, including 11 battleships.

Minister of Adm. Suzuki, former Grand Chumberlain, in place of Koiso. Yet even before this, statesmen behind the throne had been preparing the way for such an appointment and restraining the agration of Col. Kingore Hashimoto's fanatical followers for a 'regeneration' of the political structure. Koiso, though an extremist in foreign policy, was a conservative in domestic affairs, and therefore willing to co-operate with the elder states. willing to co-operate with the elder statesmen against Hashimoto, whose group wanted to get rid of the Scijukai and multitute a largo, unified, and disciplined Party State on the familiar fascist model. Party State on the familiar fascist model. The Seijukai had, since 1942, been the only recognised political organisation, but it had never had any real political stamina and behind this façade the old-time political retained their party groupings and more or less supported the gov. of the day. But apart from these party difficulties, Koiso also found the same difficulty as his predecessor, Tojo, had in securing effective co-ordination between the gov. and the High Command. Tojo had been his own war minister and had ultimately made himself chief of the army had been his own war minister and had ultimately made himself chief of the army general staff as well; Kolso deemed it imprudent to excite criticism by arrogating these posts to himself and therefore tried to co-ordinate their functions through the Cabinet secretary. But there were repeated changes in this office, one appointee after another being regarded as unsuitable—an indication more of the gravity of the administrative crisis facing the gov. than of the inherent importance of the office.

Closing days of the war and surrender of

Closing days of the war and surrender of Japan.—The Jap. garrison of 100,000 men on Okinawa defended the is, with the men on Okinawa defended the is, with the utnot tenacity, as indeed had the garrison of 20,000 on Iwojima, but organised resistance on Okinawa ceased on June 21. The campaign in the Philippines ceased at the end of the month. On July 14 J. was bombarded by Amer. warships. Then, on Aug. 6, the first atomic bomb was dropped on J. at Hiroslama (q.v.); the second (and last) of the missiles on Nagasaki on the 9th. Thus did disasters accumulate and without hone of mitigaaccumulate and without hope of mitigation in any quarter. On 'he verge of sur-render, J. now found herself confronted render, J. now found herself confronted by a new and powerful enemy in Russia, which nation had not renewed the Neutrality Pact due to expire in April 1946 unless expressly renewed, and now declared war on J. to wipe out the humiliation of past defeat and to restore the status quo of nearly half a century ago. On Aug. 9 the Red Army invaded Manchuria. Meanwhile Allied aircraft, operating from enemalizations of the past of ating from speedily-organised runways on Okinawa, destroyed in one day sixty more J. ships. This was the end. Though J. still had a great fighter air force it was to a great extent a grounded force. The measure of Jap. losses was catastrophic. Thus in Now Gumea, of an army of originally 120,000 men only 12,000 survived. Between the date of the attack

17 heavy and 22 light cruisers, 7 aircraft carriers, 139 destroyers, and about the same number of submarines, 1 escort J.'s mercantile carriers and other craft marine had practically disappeared. On land, sea, and in the an J was shattered and was now in fact faced with the pins pect of speedy annihilation from further atomic bombs. Hence on Aug 14 f accepted the Allied demand for uncondi-tional surrender addressed from Potsdam atomic bombs

half-century J., as has been shown, had pursued an uninterrupted policy of expansion. Her imperialist c aims had dominated the mind of the ruling class which moulded the outlook of the Jappeople in a manner to which hist affords no parallel. On the basis of unquestion ing loyalty to the Imperial Throne, the whole nation was taught to face any hard s) ups which might be outsiled in following the national destiny the throne itself (see Porday (Overline) in the names was evalled from a temporal to a quasi of Mr. Churchill, President Trumin, and divine institution and like the Herrenvolk

Gen. Chiang kai-shick. Anim forces be gan landing in J. on Aug. 29 and the in strument of unconditional surrender of J. Anici forces be was signed on board the Amer battleship Missouri in Tokyo Bay on hept 2. Within the ensuing days of the month the Jup forces in Luzon (Philippine) and through out the hW Pacific also suirendered while the surrender in S. E. Als was received by Adm Mountbatten on sept 2 Fhat of the Jap forces in (hma was signed at Nanking by Gen. Okamura on Sept. 9 For details of the war in the Far Sept. 9 For decails of the war in the far E., see Palific Campaigns of Fab. Lastern Front in Second Wolld War, Burma, Second World War Campaigns in Malaya, British, Jaanese Invasion of (1941-42), Navai Operations in Second World War

or the many, the servants or the librone down to the humblest private soldier were encouraged to regard themselves as a race put from the test of mankind, partici-pating in the God like characteristics of Emperor and nation Naturally the governing class was apprehensive lest the surrender should have a disastrous effect on public morale and they exhorted the merely temporary actions alamity as a merely temporary actions due to the atomic bomb but when they realised that popular loyalty was unimpaired they made no further attempt to minimise the implictions of surrender But, immune now from the risk of arrest, Prime Konove thrice Prime Minister of J., and after the surrender again one of the Lunporor's advisors, was the first import ant Jap since the surrender to declare to the world that both the China 'incident' Japan's new epoch.—The surrender of ant Jap suces the surrender to declare to J. marked the opening of a new epoch in the world that both the China 'incident' the list, of the Far E. For the preceding and the war with the Allies could have

been averted and that the Jap. militarists | been avertoo and that the Jap, militarists were principally guilty for both. Some of the oldtime leaders sought safety in suicide. Field-Marshal Sugiyama, chief of the Jap. General Staff up to Feb. 1944 and later minister of war in the Koiso Cabinet, committed suicide on Sept. 12, and Gen. Tojo tried to kill himself when Amer. officers went to arrest him. Gen. MacAsthur, supreme commender of the MacArthur, supreme commander of the macArthur, supreme commander of the allied forces of occupation, at once ordered the dissolution of the notorious R. Amur Society (sometimes called Black Dragon Society) originally founded to encourage the extension of the Jap. frontier to the Amur in Manchuria, the militarist secret organisation which for forty-five years, by assessination and other methods of coercion, ruled Jap. political life) and the arrest of its leaders. Among others arrested at this time was Adm. Shigetare Shimada, who, as navy minister, planned the attack on Peurl Harbour. Gen. Mac-Arthur found comparatively little diffiartial found comparatively neter that coulty in carrying out his instructions for the disarmament of J. and for the destruction of her war potential both in the moral and material sphere. The land forces were disarmed and disbanded and all disartial material. all aircraft were co ... cated. The United Nations (q.r.) agreed to scuttle all surviving Jap. war vessels, except about 40 destroyers and some coast defence vossels. After the dissolution of the Imperial General Headquarters and the arrest of many prominent individuals preparatory to their indictment as war oriminals came the entire control by orininals cannot be control of Allied authorities of the commercial and industrial life of J.; the break up of large estates among peasant proprietors; and the diversion of productive capacity into a programme to provide the people with the necessaries of life. All barriers to the gathering and discomination of news were removed, consorship by the Jap, authorities was forbidden, and the whole foundation of the elaborate system of thought control so effectively conducted for many years by the governing oligarchy was des-troyed. The speed of social reform and, especially, the abolition of the kempei of military security police, led to the reconstruction of the Jap, cabinet and Prince! Higashi-kuni, who had succeeded Suzuki as premier, gave place to Baron Shideham, whose administration gave an assurance that the political power of the military clique and of the bureacrats of the old

A year after the surrender the House of Representatives in Tokyo adopted by an stitution for J. superseding the Melji Constitution of 1889. This new Constitution indicated a wish to depart entirely from traditional beliefs wherever they were in conflict with the concepts of W.

Emperor, who became a symbol of the State; it renounced warfare as an instrument of public policy, and beamed the maintenance of any armed forces by which war could be waged. The adoption of this constitution was, perhaps, not surprising in view of the fact that defeat had destroyed the foundations of national life and left nothing in their place. All the old beliefs and traditions had gone. In place of an outburst of dangerous subversive activity by militarist leaders, such as had been confidently expected by experts in Far E. affairs, the Jap. people, now seemed engrossed in novel political developments on democratic lines; while the trials of war criminals, so far from investing leaders of the old type with the halo of hartyrdom, merely completed their dis-credit in popular estimation and the Diet itself pressed for a more thoroughgoing purge' of officials than any upon which the Allied Command insisted. The Jap. the Allied Command insisted. The Jap. people in fact desired neither revolution ner reaction: they were concerned principally with orderly development and the elections of April 1946, so far from representing a landslide in any direction, gave a small majority in the House to a coalition of Liberals and Progressives, the former stitute and Magnetic heirs of the former Seijukal and Minseito groups, whose popularity, however, was then steadily declining, while that of the Socialist Party was sharply rising. Women toted for the first time in Jap. hist. and there were thirty-eight women among the candidates elected. The voting age for men had been reduced from twenty-five to twenty. Experience throughout 1946 showed that Gen. MacArthur could rely upon Jap. co-operation in the task of reupon Jan, co-operation in the task of restoring normal social and economic conditions. His directives were issued to a 'linkon' dept., which was in effect the ministry of foreign affairs. Allied Military Gov. also existed, but its prin. functions the second of the conditions of the second of the tions were supervisory rather than actually administrative. Perhaps the greatest contrast with the Albed occupation of termany was that, instead of being split up into administrative zones, J. was administered as a whole by the single controlling authority, the Supreme Commander's Headquarters, working through the Jap. Gov. and, in the prove, through the Allied Military Gov., which, despite, its name, was in fact entirely staffed by Amers.

The new constitution came into effect on May 3, 1947. The first election for type had been broken, and that the aim of the House of Councillers, the new upper the administration was to inaugurate at House of the Diet replacing the old House regime in which policy would be determined by the will of the electorate.

for the Lower House on April 25. The Socialists gained more seats than any other single party, but the Communists polled only one per cont of the total popular vote. The House of thepresentatives of the Diet elected (Feb. 21, 1948) as premier, Hito-hi Ashida, Democratio party leader, to replace Setsu Katayama, a Socialist and a Christian, who had come were in connect with the concepts of W. a Socialist and a Constaint, who mad come democracy. Based largely upon Amer. into power in May, 1947 and whose Cabideas, the new constitution based the foundations of the State not upon divine (valuet (March 9, 1948) was made up of mandate, but upon the will of the elections of the lections of the legit Socialists, st. Democratic and two torate; it restricted the functions of the same year the eleven-nation Far E. Commission (the U.S.S.R. abstaining) ordered the early completion of disarmament. The future of the Spratly Islands occupied by J. on March 31, 1939 will be decided by the terms of the peace-treaty with J., but under the terms of the Yalta agreement J. has lost all her other colonial possessions and mandated is. No time-limit has been set for the allied occupation limit has been set for the allied occupation of J. but according to the Potsdam pro-clamation withdrawal would be made when the democratic objectives had been attained. Gen. MacArthur is publicly almost deified by the Jap. and any criticism there is is reserved for his system.

Industrial production in J. during the six months from April-Oct. 1948 rose from 50 per cent of 1948 rose from Through all the vicissitudes of total defeat, total demilitarisation and total occupation the Jap. succeeded in adhering to the three things essential to the future plans with which they are credited-the emperor system, the national structure of gov, and the close knit official bureauorstic machine. Under Gen. MacArthur, a 'model' new democratic constitution became law. A democratically elected Diet, fashioned partly on the But. Houses of Parliament and partly on the Amer. Congress, was actively functioning. A sweeping land reform was instituted: and trade unions were legalised after years of militaristic repression Ultra-nationalists and militarists were purged from public offices. But it was objected by some ob-servers that J.'s democratisation existed only on paper and that while, militarily, the occupation was smoothly successful, politically it achieved very little that would endure. Economically, J. was slowly recovering but still dependent upon America's hounty. Suclally, as an instrument for inspiring feudalistic Jap. to become attracted to Westerners and their ideas, the occupation might well transpire to have failed. In the material sense J co nave raised. In the material sense J was completely disarmed, a task in which the Brit commonwealth troops took an important part. Without Alicel permission and assistance, J. could not recreate her military machine for many But there was no corresponding mental disurmament or change of heart.

Despite the democratisation of Jap. political and social institutions, both Allied headquarters and the Jap. Gov. felt increasing concern over the activities of the Jap communist party, the leaders of which held their sixth ann. congress at the end of 1947. In his New Year message to the people, the former premier, Tetsu Katayama, pledged the Social Democratic party to a 'fight against Communism' to the last ditch. His Cabinet made known its intention to combat communist influence in labour unions so far as the Conence in lanour unions so ha as the constitution permits. But the strength of the communist party seemed uninpaired. The hist of the Jap. communist party Nippon kynsanio, as an independent party began in 1921, when the two men who now (1949) guide it. Kyufohi Tokuda and Sanzo Nosaka, attended the Far E. Communist Constance in Instates under the press. dency of Stalin. But their influence re-mained negligible until the party was for-mally reorganised in Dec. 1945. After that date, although claiming officially only 17,000 members (the unofficial figure was 100,000), the party became a powerful and aggressive minority group, supported by a large body of sympathisers and wielding through tireless activity an influence out of all proportion to its numbers. Their immediate aim was to win over the labour unions. Until Gen. MacArthur prohibited the general strike planned for Feb. 1, 1917, the National Congress of Ludwight Opening tipes with the aid of Industrial Organisations, with the aid of the Jap. Federation of Labour steadily endeavoured to stage muss demonstra-tions, strikes, and production control. This evidently indicated that the infiltration tactics of communists had met with some success. Success in the big industrial centres during the so-called 'October offensives' of 1946 and 1947 and the control acquired in certain rural areas, coupled also with the work of the Young Communist League (Seinen kyosin rennet), were all indicative of the party's existing and potential strength.

minist Langue (Schen kynsam reknes), were all indicative of the party's existing and potential strength.

Manchukuo 1939-40, 1940; W. M. Ball, Japan—Enemy or Ally, 1948. Japanese (War Criminals) Trial (1946– 48). The International Military Tribunal for the Far E., under the presidency of Sir Wm. Webb, met early in 1947 to try the Jap. war leaders Hideki Tojo (q.v.) and his 24 co-detendants for conspiring to wage aggressive war for the purpose of securing military, naval, political, and economic domination of E. Asia and the Pacific and domination of E. Asia and the Pacific and Indian Oceans; for responsibility in 'conventional war crimes' (i.e., atrocities) practised by the Jap. army and navy; for breaches of the laws and customs of war, and on many other counts. The trial lasted 417 days and adjourned on April 16, 1948, after hearing the prosecution's final reply to the summing up of the defence, judgment being delivered on Nov. 12. There were 1191 witnesses, 72 prosecuting and 104 defending attorneys (25 Amer., 79 Jap.) and the cost of the trial reached sev. nillion dollars. The tribunal found all the defendants guilty and 7 of them sev. million dollars. The tribunal found all the defendants guilty and 7 of them were sentenced to death by hanging. Of the 7, all but Koki Hirota foreign minister (1933–36), were military men. These were Gens. Hideki Tolo, Kenji Dolhara, Seishiro Itagaki, Heitaro Kimura, Iwane Matsui, and Akira Muto. All the other accused were condemned to impresement for Hig event Moreon Shire. Dolhara, Seishiro Itagaki, Heltaro Kimura, Iwano Matsui, and Akira Muto. All the other accused were condemned to imprisonment for life, except Mamoru Shigennitsu, foreign minister (April 1945), who was sentenced to 7 years imprisonment, and Shigenori Togo, foreign minister under Tojo, sentenced to 20 years' imprisonment. Marquess Koichi Kido, Lord Keeper of the Privy Seal and other accused were condemined to imprisonment for life, except Mamoru Shigemitsu, foreign minister (April 1943-April 1945), who was sentenced to 7 years' imprisonment, and Shigenori Togo, foreign minister under Tojo, sentenced to 20 years' imprisonment. Marquess Koichi

one of the Jap. Emperor's closest advisers, was among those sentenced to life imprisonment. All the accused, except Matsui and Shigemitsu, were found guilty on the charge of conspiracy. Matsul was tound guilty on only one count—of 'doing nothing to abate the herors of wholesale massacres, individual nurders, rape, looting, and arson connitted by Jap. soldiers under his comeand in Nanking in 1937. Shigenitsu wa found innocent of conspiracy, but gullty if waging a war of aggression and of failing to investigate the augresion and of leading to investigate the question of the treatment of prisoners of war. Hirota was foul guilty of formu-lating a policy of expasion in E. Asia and S. areas, promoting a aggressive polic towards the Soviet Uson and supporting mulitary operations in hina. The India judge (Mr. Justice Pa entered a dissenting judgment recommnding a verdict of not guilty on all couts. The members not kning on an coust. The members for France and the Neterlands also entered a discerting judgmo. The President, expressing an opiniodiffering in certain ways from the mudty judgment, said that the crimes of the Jap, accused were far less heimous, v.ed, and extensive than those of the Oc accused at Aironberg. He expatiateon the implications berg. He expatiation the implications of the Jap. Empero.responsibility. The authority of the Emror (he stated) was proved beyond queon when he ended the war on Aug. 14, 45. The outstanding part played by a Emperor in starting and onding thear was the subject of evidence led byte prosecution, yet the prosecution mat clear that he would not be indicted. Bhought there best not be indicted. Bhought that a Brit. not be indicted. Mought that a Brit. court would, in pass sentence, not forget that 'the lea in crime,' though available for trial, d been granted immunity and if, in h a case, the court must by law imposap. punishment, the prerogative of mer would probably be preparative of the would probably be exercised to save? lives of the con-denned. On the arge of committing atrocities, the tribi found that torture, murder, rape, ander crueities of the most inhuman antrbarous character were freely practi by the Jap. army and navy. Atroc were committed in all theatres of wan a scale to vast and on so common aftern that the only conclusion possible that those atroci-ties were either thy ordered or wilfully permitted by Jap. gov. or by the leaders of the arriorces. The death leaders of the artforces. The death rate among prise in Jap, hands was 27 per cent as agi 4 per cent of allied prisoners taken the Ger. and It. armies. Capturdmen were murdered in the hope that 'fate would discourage the allies froiding J. At Balikpapan (Borneo), hire white pop. was murdered becaue oil wells were not surrendered intaSome were killed by having their argid legs chopped off

not be 'obsestd by mistaken ideas of humanitarianism, to all protests from the alies over the treatment of prisoners the Jap gov retuned only lying or evasive answers. When the end of the war was in sight a determined effort was made by the Jap give to assist its eliminals in avoiding punisment and orders were in avoiding punishment and orders were issued for the bulning of all documents and permission given for persons who had maltreated prisodies to fice without trice. The proceedings of the tribunul covering the actives of ocarly a score of different (abinutageous the unvioleding determination withwhich the rulers of J endeavoured to suguard that oligarchic system which the termed the national system which the termed the national polity it was cleat to them that even if they were defeat! the old J would be able to emerge again provided that the nutional polity we not destroyed—for them the privat of the national polity was the maintenance of ic unperril system

Jashpur, trib state of the Central Prov India In the bed of the R Ib the most

first vol. of poems, called Papillotos (Curl Papers), was pub. in 1825, containing some verse in Fr., but mostly in the Provencel 'patois.' These 'patois' poems are generally in the form of short epic narratives, both grave and gay, dealing with familiar scenes of the peasant-life in which he took part, and marked by spontaneity and simple grace of diction. J. is now generally considered the direct fore-runner of Mistral, and the **Ptibrige*. Four successive vols. of the **Papillotes* were pub. successive vols. of the Papillolos were pubduring his life-time and contained the samous poems (Charivari'; 'My Recolections'; 'Martha the Simple'; 'The Twin Brothers'; 'The Blind Girl of Castel-Cuillé' (trans. into Eng. by Longfellow, and set to music by Coleridge-Taylor, 1901); and 'Françouetto' (trans. into Eng. by J. D. Craig in his Poets and Poetry of the South of France, 1866). See L. Rabam, Jasmin, as Vie et ses Gueres, 1867; F. De Montrond, Jasmin Poete (2nd ed.), 1876; J. Andrien, Jasmin et sim Guerr, 1881; C. A. Sainte-Beuvo, Portraits contimporains, 1870; J. Smiles, Jasmin, Barber, Poet, Philianthropist, 1891; X. Cardaillac, Propos Gascans; Jasmin, 1898; and P. Marieton, Jacques Jasmin, 1898. Jasmin, 1898.

Jasmine, or Jessamine, term applied to the various species of Jasminum, a genus of Oleacee. There are between one and two hundred of these shrub-, most of which bear sweet-scented flowers tollowed by a fruit which is vertically divided in two. J. officinale, the common J., grows in Europe and Asia. Besides the true J. there are many very different plants to which the name is given. Thus Gardenia forida, a species of Rubiacere, is known as Cape J.; Gelsemum semperarens, a species of Loganiacee, is the Carolina J.; Plumeria rubra, a species of Apocynacee, is the jasmine-tree; Calotropis process, an asclepiadaceous plant, is the Fr. J.

Jason: In Gk. mythology, the leader of the Argonauts, was a son of Æson, king of loicus. His half-brother, Pelias, drove him from the kingdom, and he was edu-cated by the Centaur Chiron. Pelias was warned by oracle against the man with one sandal. When J. came to claim his kingdom, he entered the mkt.-place with one sandal, and Polias, recognising the omen, sent him in search of the golden fleece. J., by the help of Medea, secured the fleece and returned with her in the Argo. Medea, pretending to restore youth to Pellas, per-buaded his daughters to dismember him and place the member in a cauldron.

J. and Medea were expelled. Finally J. J. and Medea were expelled. Finally J. forsook Medea for Glauce, and Medea in revenge slew the new bride and her own children by J. For a graceful popular ac-count, see Charles Kingsley's Heroes ('The Argonauta').

Jason, name of the origin in common use among the Jews. J. was a favourite equi-valent of Heb. Joshua. There are sev. J.'s mentioned in the Apocrypha, and one in the N.T.: (1) Of Cyrene, a Hellenistic Jew who probably lived in the second half of the second century B.C., and was the author of a hist. of the times of the Maccabees down to the victory over Nicanor

(175-161). (2) The second son of Simon II. By means of a bribe to Antiochus Epiphanes he managed to usurp the high priesthood of his brother, Onias III. (Antioch II.). Another bribe enabled him to set up a gymnasium in Jerusalem to him to set up a gymnasium in Jorusalem to enrol the inhabs. of Jerusalem as 'citizens of Antioch,' He subsequently died in exile (see 2 Macc. iv., v.). (3) The son of Eleazer, sent by Judas to Rome (1 Macc. viii. 17). He is probably the J. who is mentioned as the father of Antipater (1 Macc. xii. 16). (4) Of Thessalonica, was the host of St. Paul in that city and his surety with the magistrates (Acts xvii. 1) and according to tradition history. 1), and, according to tradition, bishop of Tarsus. He may be identical with the J. of Roms. xvi. 21, Paul's 'kinsman.'

Jaspar, Henri (1870–1939), Belgian statesman and premier from 1926–31. A member of the Catholic Party he was intimately associated with the post-war reconstruction of Belgium as minister of economic affairs. Subsequently became toreign minister and their Premier. In 1929 he became permanent president of the Reparations Commission.

Jasper, crypto-crystalline form of silica, usually opaque, through contained argillaceous matter. It is related to flint, chert, and chalcodony, and is found in veins and cavities in igneous rocks from which it is derived by decomposition. Through the admixture of exides and silicates of iron its colours vary from red, brown, yellow, to green. The jasper of antiquity was apparently a brilliant green translucent form, and the name was evidently applied to forms of chalcedony. The ribbon J. of Siberia has well-marked red and green stripes. Egyptian usually occurs in brown nodules in the Nile valley and Libyan desert. A rather rare form of the mineral is termed porcelain J., and it is distinguished by minute holes and a multiplicity of cracks; it has evidently been so altered by being baked in silu.

Jasper Park, largest national park in the world, situated in N. Alberta, Canada, world, structed in N. Alberta, Canada, has an area of 4,521 sq. in. It was estab, in 1907. It is connected by road with Bant' national park over the Columbia Icetied Highway and glaciers come right down alongside. The park is reached from Edmonton by train on the main line of the Canadian National Railways. A curious port in relation to the hist of the curious point in relation to the hist, of the park is that it was named after a yellowheaded if otherwise obscure young fur-

headed II otherwise customs young americal from Missouri.

Jaspers, Karl (b. 1863), Ger. philosopher and p-ychiatrist, b. at Oldenburg, son of Karl J. a bank director. He was educated at the Humanistisches Gymnasium, Oldenburg. He became a Privatdozent 1012 and prof. there in Oldenburg. He became a Privatdozent at Heidelberg in 1913 and prof. there in 1916. He has been Prof. of philosophy Basel Univ. since 1948. During the Second World War J. never made the slightest concession to the Nazis and courageously upheld the great traditions of W. civilisation, symbolised for him by such numes as tloothe, Jacob Burckhardt, Kierkeguard and Nietzscho. The address which Ludirand on the occasion of his which J. delivered on the occasion of his

being awarded the Goethe Prize of the Group under Gen. Malmovsky attacked city of Frankfurt (Aug. 1947) indicates his unequivocal search for truth and his profound understanding of the spiritual and nonderstanding of the spiritual and normal needs of our age. This is exempled, with a reverve line in the wooded inoral needs of our ago. This is exemplified in his book Von der Wahrheit. As an existentialist philosopher he shows much more balanced and responsible thought than Heldegger and sev. other existentialist philosophers. His pub. works include Psychopathologic (1913, 1946), Psychologue der Wellanschauung (1919, 1926), Philosophie (1942), and Von der Wahrheit, 1948. See E. L. Allon, The

heights behind J. But the impetus of the Russian attack carried all before it, and though there was street fighting after the Russians entered the tn. it fell to them on Aug. 22 after a three day battle which broke the Axis line to a width of 75 m and a depth of nearly 40 m. between the Sereth and Pruth Pop. 109,000.

was installed to discuss the budget and I advise the gov. of which in 1925 the Dutch R. Indies were granted a measure. The 'Volksraad' and the governor-general share the legislative powers between them. in 1940, when Holland was overrun by the Germans, the lutch E. Indies became the seat of the Dutch Govt. in conjunction with representatives in London, and it was for J. and the other colonial possessions that the Dutch carried on the war against Japan for a short time; but eventually the Jap, gained complete control of all the Dutch E. Indies. The natives are under native tribunals, superintended by Europeans in certain instances, schools for primary instruction have been estab. at Batavia and other prin. tns. There are also public secondary schools in connection with the primary schools, and High Schools for Technology, Law, and Medicine.

Mohammedanism is now the prevailing religion in J.; but before its introduction at the end of the fourteenth contury Brahmanism and Buddhism had prevailed. Among the Buddhistic ruins is the famous temple ruin of Boro-Budur built about A.D. 750. The art of J. was chiefly developed under Hindu influence and the early drama strongly suggests Indian origin. J. exports chiefly sugar, coffee, tea, rubber, quinine, and taploca, mattan and petroleum products. Rice is grown extensively but does not suffice for local consumption. In 1937, the total exports from J. and Madura were valued at over 1,000,000,000 guilders, Imports were valued at half that figure. There was before the Second World War, a weekly mail service by luxurious Dutch boats to and from Holland; and regular steamship connection with Singapore and other neighbouring ports, as well as with Australia, China, Japan, and Brit. India. The railway system of J. is highly developed and covers practically the whole of the is. There were regular air services between Reteries. Among the Buddhistic ruins is the famous of the is. There were regular air services between Batavia, Sumarang, and Sura-baya, and also between Batavia and Medan.

Medan.

History during and after the Second World War.—Following the Jap. naval victory of Feb. 27, 1942, in the battle of the J. Sea, J. was occupied by the Japs. Palembang was raided by allied aircraft at times but otherwise J. was not the scene of any fighting in the war. After the Jap, surrender in Aug. 1915 the Dutch, because to the process to having no ships or troops to spare were unable to resume possession of the is. and the internal situation was complicated by a widespread Indonesian revolt against the small allied forces which tried to enter on behalf of the Dutch. Before the war there was a Nationalist movement in the by the W. Powers. During the war the Indonesian Nationalist leaders took office under the Japs. in various Jap. sponsored organisations. Late in 1944 Japan made a formal promise of independence to the Indonesian nationalist leader, Dr. Sockarno and, after the Jap. surrender,

republic. When the Japs., saw that they were to lose the war they gave every encouragement to the independent movement in order to complicate the position for the ailies, and to that end they gave much of their military equipment to the Indonesians. The latter, seeing the diffi-culties of the allies, made the most of their opportunities and by the time the first allied troops were ashore, they had gathered nearly all the reins of power into their hands, besides drawing up a republican constitution with Sockarno as President. In the meanting the Dutch were dependent on the Brit. The original purpose of the despatch of Brit. forces to J. was to arrange on behalf of the United Nations for the disarming of the large Jap. garrison and for the safety of the Dutch and Eurasian prisoners of war and in-terness. But these tasks were greatly complicated by the action of the Japs. in handing over stores of arms to the Indo-nesian' youth' movements and encouraging Indonesian nationalists to occupy the administrative posts which they them-selves had to relinquish on their surrender. Thus inevitably the Brit. torces became involved in local politics, with the un-enviable task of trying to reconcile two incompatible responsibilities—respect for the position of their Dutch allies and respect for a nationalist movement of the respect for a nationalist movement of the very type for which Britain was making provision by the announcement of a new policy in India, Burma and Malaya, Queen Wilhelmina's policy, outlined in Dec. 1942, provided for an imperial conference after the war, to settle the future relationship between the component parts of the Dutch empire; but the Netherlands gov. failed to appapelate the hold which the Nationalist movement had gained in J. and the initial negotiations were pre-J. and the initial negotiations were pre-judiced by the reluctance of the Hague to deal with men rather hastly discounted as 'quisings.' By the time a new Indonesian cabinet had been formed from men who had a good record of resistance to the Japs. and the Dutch proposals were advanced in a more conciliatory spirit, the temper of the Nationalist leaders had hardened and, by the late autumn of 1945, there was but little hope of inducing the main parties to come to the conference table.

Fighting in Surabaya between Brit. troops—chiefly Mahratta and Rajputana infantry—commanded by Brig. A. W. F. Mallaby, and the Indonesian extremists Mallaby, and the Indonesian extremists broke out at the end of October, following the announcement by allied leaflets that a military gov. was to be instituted. This outbreak postponed indefinitely the political talks which had been arranged to take place in Batavia between Dr. van Mook and the Nationalist leaders. Towards the end of Nov. there were two divs. of Brit. troops in J. and their difficulties arose less from the resistance of the extremists, which was both unskilful and fanatic, than from a desire to spare Indonesian lives and to avoid the development of a racial war. Brig. development of a racial war. Brig. Mallaby the Brit. commander in Surabaya Dr. Soekarno publicly announced that Mallaby the Brit. commander in Surabaya Indonesia was a sovereign independent was murdered on Oct. 30 when discussing

with local Indonesian leaders the details | realm. cease-fire agreement. Gen. or a cease-ine agreement. Gen. S. Philip Christison, the allied commander in the Netherlands E. Indies, then broadcast a warning that unless the Indonesians who had broken the truce surrendered be would bring the whole weight of his forces against them. Brit. destroyers arrived at Surabaya, in and around which tn. there were some 15,000 armed Indonesians, in order to evacuate Dutch women and children. Soekarno expressed regret at the murder of Brig. Mallaby but the murder by extremists over whom he had shown he had but slight control was the worst set back yet suffered by the inde-pendence movement. Troops of the 5th Indian Div. then arrived in force in J. from Singapore and some battalions, with

armoured units, were posted to Surabaya.

The political situation was further complicated at this time by the announcement from the Hague that Dr. van Mook, the Dutch political and administrative head in J., was negotiating with Soekarno against the instructions of the Netherlands Gov. But on Nov. 6 van Mook announced the main points of a declaration of policy, making provision for an Indonesian Com., wealth. But with war in progress and the Dutch thinking in terms of war, such a declaration which might have been effective earlier, now signified next to nothing and indeed Sockarno, who now leared trouble it the Dutch regained control, rejected the local gov.'s terms. Many Indonesians were killed in tanatical charges against Brit. tanks in Surabaya manned by Mahratta troops. Indonesian-manned Jap. tanks fired at the 5th Indian divisional headquarters but were soon silenced. Various Indonesian headhead. quarters were bombed and demolished. There was now evidently disunity among the Indonesians: for a new group of Nationalist leaders, headed by Sjahrir and Amu Sjarifudin announced that they would meet Brit. but not Dutch represen-tatives. But fighting continued in Sura-baya, Semarang, and other places. Rocket fring aircraft of the R.A.F. put out of action the wireless stations at Surakart. and Jokjakarta, which had been used for and Johnston, when have been deed used to violent propaganda against the Dutch, the Brit., and the more moderate Indonesians. Indonesian terrorists attacked a camp for interned persons at Ambarawa killing women and children. There was there fighting (Nov. 26) near Ambarawa between Gurkhas and Indonesians. Meanwhile the national convention of the re-publican movement continued its leisurely and academic deliberations and soon the main centre of trouble shifted to Baudoeng. Rocket-firing Mo-quitoes and dive-bombing Thunderbolts were used against the Indonesians in S. Bandoeng. In April of the next year Lord Inverchapel arrived the next year Lord Inverthapel arrived as mediator and, as a result Indonesian envoys and Dr. van Mook the governorgeneral, went to the Hague for negotations. It was agreed that an Indonesian epublic should be formed as part of the Commonwealth of the Dutch E. Indies within the circle of the whole Dutch 1942. and In Javanese Waters, 1944;

realm. This was based on the charter proclaimed by Queen Wilhelmina in Dec. proclaimed by Queen Wilhelmina in Dec. 1942 to give equal status and equal rights of citizenship to all parts of the Dutch realm. The Dutch would not, however, agree that the projected republic should extend beyond J. to include Sumatra, the Celebes, Moluccas, and other is., until the wishes of the natives were known. Dr. Sjahrir then went off to lay the Hague agreement hefers Seekarne and returned agreement before Soekarno, and returned, after a long time, with counter proposals which rejected everything agreed at Tho Ingue and demanded the formation of an entirely independent Indonesian Re-public, to include all the Dutch E. Indies, punne, to include all the flutch E. Indies, thus repudiating all thought of a federative scheme. In view of Soekarno's bad record in the war, it was not surprising that negotiation was difficult if not impossible. Soekarno had hastened to collaborate with the lone. laborate with the Japs. . he was president laborate with the Japs. he was president of their puppet gov. in J. and was decorated by them. A hery orator, with no constructive ability, the Dutch naturally refused to have any dealing with him. All through the year fighting had never ceased and there was continual guerilla sniping by Soekarno's followers. Meanwhile there were still over 30,000 internoes—Dutch women and children, Euraslaus and Javanese ('hristians in the extremist's heads, all of them week and extremist's hands, all of them weak and emacated to the edge of starvation and dejected to the loss of all self-respect. Yet the men who could thus treat their fellow-evantures (some of them their fellow-countrymen) claimed the right to rule 40 millions of Javanese. The next im-portant development was the draft agreement signed by Dutch and Indonesian delegates at Cherlbon (Nov. 18, 1946), by which the Dutch Gov. recognised the gov. of the republic of Indonesia as exercising de facto authority over J., Madoera, and Sumatra. The areas then occupied by allied or Dutch forces were to be included gradually through mutual co-operation in Republican ter, and measures were to be taken at once to ensure that this inclusion was completed by Jan. 1, 1949. The Indonesian question, however, was by no means so near settlement as that agroement implied. Indeed the final cease-fire was not jointly ordered by the Dutch and Republican Govs, until Aug. 1949. This order followed the winding up of the 'pre-liminary conference' of Dutch and Ropublican representatives held at Batavia before the ensuing round-table conference at the Hague. At the same time an inter-indo-nesian conference, held to settle the principles of the constitution of the 'Re-public of United Indonesia' as the new state was to be called, reached agreement on controversial issues concerning the inner cabinet and the senate. (See also Indo-NESIA).

Jaxt, see JAGST.

Jay, or Garrulus glandarius, species of the sub-family Garruline and of the crow fine sub-raminy Garrunna and of the crow family (Corvide), and is a native of Europe, while other species of the same genus are found in India and other parts of Asia and in Japan. In the New World the blue Js. (Cyanocitta) are found in N. America and Cyanocorax in Central and S. America, these latter birds being more blue than the common J. In England the common J. has become rare owing to per-secution, and this is the case in Scotland and in some parts of Ireland. It is char-acterised by a creat of black and white feathers, a black tail, and white and black bars on the wing coverts, its body being a bars on the wing coverts, its pody penns a brownish colour on the upper surface and lighter underneath. It has also patches of blue. The Js. are sly and retiring in their habit, and have a screeching cry with the power to vary it by mimicking other birds. They feed chiefly on smalls, insects, worms, and nuts. They hide insects, worms, and nuts. They hide their nests in trees with thick foliage and lay about six or seven eggs at a time.

Jay, Harriett (1863-1932), Scottish author and actress, was brought up by Robert Buchanan, the Scottish poet and writer, who married her elder sister. Sho writer, who married her enter sister. Since collaborated with Buchanan in sev. of his works, e.g. The Shopwalker and Two Lattle Mads from School, and pub. independently: The Queen of Connaught (1875), Madge Dunraven (1879), Two Men and a Maid (1881), A Marriage of Convenience, (1885) and The Life of Robert Buchanan (1903). As an actress she also won great distinction.

won great methodon.

Jay, John (1754–1829), Amer. politician and lawyer, b. at New York. He drew up the constitution of New York State in 1777, and was appointed judge. He became president of the Congress in 1778. In 1789 he was made chief justice of the Supreme Court. In 1791 he drew up a treaty, called the Jay Treaty, whereby the unland trade between the United States and Brit. N. America was properly States and Brit. N. America was properly organised in the interests of both countries. J. became governor of New York in 1795. He was a very able politician, especially in the held of international politics. Lives have been pub. by W. Jay, 1833; W. Whitelocke, 1887; and G. Pellew, 1890.

Jay, William (1769-1853), Eng. Nonconformist minister, b. at Tisbury, Wiltshire, England. Early in life he worked as a ma-ou. Cornelius Winter provided

as a mason. Cornelius Winter provided for him to be educated as a minister. His devotional writings had a vast circulation in England and America. See G. Redford and J. A. James (ed.), Autobiography of William Jay, 1854.

Jay, William (1789-1858), Amer. abolitionist, b. in New York. He became a judge in 1818. He founded the Amer. Bible Society (1815), but the greater part of his energies were devoted to antislavery interests. The Anti-Slavery Society had in J. one of its most fervent and eloquent members. In 1833 he pub. the Life and Writings of John Jay. See B. Tuckerman, Jay and the Constitutional Movement for Abolition, 1893.

Jayadeva, Hindu poet, best known as the author of the mystic poem, Gitagorinda. His date is disputed; Lassen believes he f. in the twelfth century. He is considered the finest lyric poet of India. is considered the finest lyric poet of India. See Sir W. Jones, Poems, consisting chiefly of Translations from the Asiatic Languages, 1777; Sir E. Arnold, 'The Indian Song of Songs' from the Gita Gorinda of Jayadera, 1875; and Indian poetry, 1881.

Jazyges, Sarmatian tribe, who lived N. of the Sea of Azov. In the first century A.D some of them settled in Hungary, others N. of the Carpathians.

Jazz name given to the development.

Jazz, name given to the development after the First World Way of dance music, a musical idiom deriving in mood, it is claimed, from negro folk-song and based claimed, from negro folk-rong and based technically on the device of syncopation, that is, on delayed or misplaced accent. The term is often misapplied to what may more accurately be called 'ragtime,' a crude attempt to give vitality to dance music which was practised in England during and immediately after the First World War, and which was remarkable only for its sterility. J., or, as it has also been called, symphonic syncopation, was introduced into England from America in 1924, when Paul Whitemen's band made a tour of the courter. 1924, when l'all whitemen's band made a tour of the country. Since then it has developed very rapidly, though only remarkably in the instrumental virtuesity of its executants. The early jazz musicians, like the early medheval choirs, improvised a rudimentary counterpoint while listening to the melody. But now their tunes are elaborately and variously scored and the quality of present-day. scored, and the quality of present-day dance bands is to be judged chiefly by the harmonic and rhythmical resources of the orchestrator. Although J. has still to win the approval of serious musicians, it will undoubtedly be part of the social hist. of the early twentieth century. Mr. T. S. Eliot has suggested the effect the internalcombustion engine has had on our perception of rhythms. Something of the sort seems responsible for the popularity of J.. combining, as it does, an easily repeated formula of melancholy, very welcome the omotionally bankrupt or wasteful, with the comforting reliability of a precise with the comforting reliability of a precise ongine beat. 'A hypnotised abandonment of self,' it has been shrewdly defined, 'to the exact rhythms of machinery.' See A. Casolla, Il Jazz and Della Musica Necessaire in 'L'Italia Letteraria,' and reprinted in '21 + 26' (Rome), 1931 and W. Hobson, Imerican Jazz Music, 1940.

burg. It has a supply of natural gas. I'op. 16,200.

Jeans, Sir James Hopwood (1877-1916). Eng. mathematician, b. at Southport, son of W. T. Jeans, a parl, journalist. Edu-cated Merchant Taylors's School; Trinity College, Cambridge; 2nd wrangler, 1898; Smith's prizeman, 1900. Fellow of Trinity, 1901; univ. lecturer in mathematics, 1904. Prof., applied mathematics, Princeton Univ., 1905-09. Stokes lecturer in applied mathematics, Cambridge, 1916-12. Awarded Adams Prize in 1917 for essay Problems of Cosmogony and Stellar Dynamus. Secretary to Royal Society, 1919-29. Recearch associate, Mt. Wilson Observatory, 1923. President, Royal Astronomical Society, 1925-27 Knighted, 1923. O.M., 1939. President, Brit. Association, 1934. One of his first scientific investigations was that resulting in the proof of Maxwell's law governing the distribution of velocities among mole-College, Cambridge; 2nd wrangler, 1898; Smith's prizeman, 1900. Fellow of the distribution of velocities among molethe distribution of velocities among mon-cules, his studies in this field being pub. in 1904 as The Dynamical Theory of Class. At Princeton in 1906 he pub. his Elemen-tary Treatise on Theoretical Mathematics, and, two years later, his Mathematical Theory of Electricity and Magnetism, the At Princeron in 1906 he pub. his Elementary Treatise on Theoretical Mathematics, Sophoeles with trans. and commentary and, two years later, his Mathematical in 7 vols. His other works include: The Theory of Electricity and Magnetism, the Primer of Greek Literature (1871), Modern

of the development of the Quantum Theory, on which latter, in 1914, he made a report to the Physical Society entitled Radiation and the Quantum Theory. But his most impressive work was that which he accomplished in the sphere of comogony, on which he pub., besides the cysny above, Astronomy and Cosmogony (1928). In this field his most striking achievement was his explanation, following Chamberlin and Moulton, of planets and their satellites as being due to tidal forces raised in a star by the close passure of another star. The completeness of these mathematical investi-gations destroyed the nebular hypo-thesis of Kant and Laplace. He also threw some light on the conjectural source of stellar radiation and energy. His popular expositions of science enjoyed phenomenal sales—less surprising in view of the attractive style of his treatises, the non-mathematical sections of which may be enjoyed even by the layman. These popular books also include J.'s contentious philosophical deductions from modern science. He stressed the part played by mathematics in science to a degree scarcely equalled since Pythagoras. Other works: Atomicily and Quanta (1926), Ros, works: Atomicily and Quanta (1920), Ros, or the Wider Aspects of Cosmogony (1928), The Wuter Aspects of Cosmogony (1928), The Mysterious Universe (1930), The New Background of Science (1933), and The Grouth of Physical Science (pub. in 1947), Jebail, or Jebeil (1 anct. Byblos), tn. on the coast of Syria, near Mt. Lebanon, and

the coast of Syria, near Mt. Lebanon, and I's m. N.N.E. of Beirut. It has old walls, a fine citadel, a castle dating from the crusades, and an interesting medieval church. Many sacophagi were found here during excavations. The old walls are 1 m. in circumforance. Pop. 350.

Jebavy, Václav, Czech poet, writing as Otakar Brezing, b. 1865 at Počátky, S. Bohemin. Vols. of poems: Secret Distances (1895), Domining in the Hest (1895), Polar Winds (1897), Temple Builders (1896), The Hands (1901). Ex ays: The Music of the Springs (1903). Eng. trans. of his poetry have been made by Percy Paul Selvein: Anthology of Modern Stacenne Literature (1919), and Otaka raul Selverin: Anthology of Modern Slavome Literature (1910), and Otaka Bresina (1921).

Jebb, Sir Richard Claverhouse (1841–1905). Scottish classical scholar and writer, b. at Dunde. He was senior classic at Cambridge in 1862. In 1875 he was made prof. of t.k. at Glasgow Univ., and in 1889 was appointed regims prof. of tk. at Cambridge. He was chief pro-moter of the inter-collegiate classical lectures at Cambridge, and helped to organise the Cambridge Philological Society. He was also one of the founders of the famous Brit. School of Archaelesy at Athens. In 1891 he became Umonist M.P. for Cam-bridge Univ. J. brought out some of the finest eds. of the Gk. classics. His best works are perhaps his ed. of and commen-tary on The Attic Oralors from Antiphon to

Its example was followed.

Jeejeebhoy, Sir Jamsetjee Bart (1783-18 9) Indian merchant and philan thropist b at Bombay He gave hos pitals schools, colleges and public works in 1842 Queen Victoria bestowed knight

hood on him, and in 1858 a baronetcy Jesseries, John Richard (1848–87), Eng naturalist and novelist, son of a small farmer was b at Coate Farm, near Swin don, Wilts He went to school at yden ham then it Swindon until he was about fifteen but his most inspiring teachers were his father and a keeper on a neigh bouring estate who made him acquainted

RICHARD JEFFERIKS Plaster cast from a bust by Margaret Thomas

with the wonders of nature and taught him to use his powers of observation. In deed it is said that he really owed his first work of any value, The Camekeeper at Home (1878) to what he had learned from his close friendship with the Burderop keeper whom he used to help as a youth by keeping down vermin on his pheasant preserved He began life as a journal of preserved He began life as a journalist on the staff of the North Wilts Herald of which he was editor during 1866-67 His letter to the Times (1872) on 'The Wilt shire Labourer' brought him into public notice and thereafter he wrote for the tion in 1929 Its example was followed Pall Mall Gazette, in which appeared his

Camekeeper at Home and Wild Life in a Southern County (1879) both afterwards repub. Both these works are full of minute observation and vivid description of country life. They were followed by The Amaleur Poacher (1880), by some considered his best work; Wood Magic (1881); Itound about a Great Estate (1881); The Open Air (1885) (with a Brighton and Boachy Head background) and others on similar subjects. Among his novels are Bevis (1882) in which he draws on his own childish memories and which has been described as the best boys' book in the language; and After London, or Wild England (1885), a romance of the luture when London has ceased to exist. The Story of my Iteart (1883) is an idealised picture of his inner life. Life of the Fields (1883) includes one of his bost essays—Clematis Lane. Other works are: Hodge and his Masters (1880), Nature near London (1883), and Amarytlis at the Fair (1887). J. died after a painful illness, which lasted for six years. In his own line, that of deneting with an intimate knowledge of nature, all the clements of country life and wild life, plant and animal, surviving in the face of modern civilisation, he has had few equals. Fix. and Hedgerow was pub. after his death (1859). See lives by E. Thomas, 1909; C. J. Masseck, 1913. See also S. J. Looker (ed.), Jefferies England, 1937; M. of Richard Jefferies, 1918.
Jefferson, Thomas (1743-1826), third, and one of the greatest Prosidents of the U.S.A., b. at Shadwell, Albomarle co., Virginia, the son of a planter. He was of Welsh origin. A member of the was of Welsh origin. A member of the second Continental Congress of the thirteen America's pantheon by writing the Declaration of independence, which was adopted with but a few slight changes. He was made governor of Virginia in 1779, and narrowly escaped capture by Tarleton. He succeeded Benjamin Franklin as the Amer. envoy to France, and later when Washington became President of the U.S.A. he made J. secretary of state. It was largely due to J. that the cap. of the U.S.A. was estab. on the banks of the Potomac R., in what is now the city of Washington, and he himself afterwards was the first President Inaugurated there. In 1796 Hamilton was the natural leader of the Federalist party, but John Adams was nominated for the Presidency. J., as the leader of the Republican, which afterwards became the historic Democratio party, ran against him. Adams was elected President, and J. Vice-President. In 1800 J. once more ran for the Presidency with Aaron Burr as his party's candidate for Vice-President, and Burr had received an equal vote. J., however, was chosen by the House of Representatives on the advice of his old antagonist Hamilton. In 1804 J. was e-elected by an overwhelming majority. The greatency was the Louisiana purchase, where

by the U.S.A. secured a vast ter. W. of the Mississippi R. some 1,171,931 sq. m. in extent. This purchase completely changed the future hist. of the U.S.A. It paved the way for continental expansion. It made the Mississippi entirely an Amer. owned riv. During J.'s term also the U.S.A. sent an expedition against the Tripoli pirates and stopped their raids, considerably reduced the national dobt, and issued the famous embargo act prohibiting the salling of Amer. vessels for foreign ports while the Brit. and Fr. navies were chasing each other on the high seas. At the close of his second term, the legislatures of cight states asked him to run for a third torm, but he declined, thereby setting the precedent that no President shall serve for more than two terms—a precedent set asked for the first time in 1940 when President Franklin Roosevelt became President for his third term.

J. was a statesmun of compromises; for J. the philosopher, in the eighteenth century sense, was rather a different man from J. as manager of his own large properties and as office-holder. Thus, while he hated slavery and tried to suppress the traffic he remained the owner of 200 negroes; he was always suspicious of bankers, yet he turned to London for the funds needed for the Louisana purchase; and he hated political chicanery, yet ho must have been aware that a bargain was being struck between his supporters and those or Alexander Hamilton to obtain his election as president. Such compromises, however, are the price of political pre-eminence. Nevertheless the positive and outstanding achievements of J. were very great; in his own state of Virginia, the termination of feudal land tenure, separation or Church and State, the foundation of a programme of free education; in the United States, the public land system, the Bill of Rights, and the Louislana purchase—besides considerable contributions to the theory of checks and balances among the executive, legislative and judicial branches of the

checks and balances among the executive, legislative and judicial branches of the federal constitution.

J. retired to his home, Monticello, in Virginia, and in his old age founded the univ. of Virginia near Cha lottesville. A curious thing about J. is the epitaph he wrote for his own tomb. He, who had held so many high others at the hands of his countrymen, wrote this: 'Here was buried Thomas Jeflerson, author of the Declaration of American independence, of the Statute of Virginia for Religious Freedom, and Father of the university of Virginia.' He died on July 4. A memorial tablet was unveiled to J. in 1933 at Glynceirog, N. Wales, of which vil. his father was a narive. He made an important contribution to the Revolutionary cause in A Summary View of the Rights of British America (1714). See M. Beloff, Thomas Jifferson and American Democracy, 1948. J. Dewey, Jefferson, 1943.

J. Malone, Jefferson the Virginian, 1949.

vino, Kentucky. The city possesses ran-way works, machine shops, and iron foundres. Pop. 11,400.

Jeffries, Ellis (1872–1943), Eng. actress, b. at Colombo, Ceylon. Associated with Cyril Maude at the Haymarket, where one of her greatest successes was in W. H. Davies's comedy Cousin Kate. She began her career at seventeen in the chorus of the Savoy Opera and played in pantomimo and light opera. Sang most of the female parts in La Urgale at the Lyric Theatre. She then took part in comedy with Charles Wyndham at the Criterion, in The Bauble Shop and other plays by Henry Arthur Jones, with John Hare at the Garrick, in America in The Notorious Mrs. Ebbsmith, and at the Duke of York's in The Marriage of Killy. Tall, graceful, with a clear, inclsive utterance, she was a true comedian, but was not deficient in the dramatic force required for such rôles as those of Zicka in Diplomacy and Olga in Began a film career in 1930, appearing in Eliza Comes to Stay, The Return of a Stranger, and other pictures. Twice married, her first husband being the Hon.

George Curzon. Jeffrey, Francis Jeffrey, Lord (1773-1850), Scottish judge and critic, educated at Edinburgh, Glasgow, and Oxford. Meeting for years with little success, either Meeting for years with intie success, siner as lawyer or journalist, his opportunity came in 1802, with the founding of the Edinburgh Review. Sidney Smith was first editor, but when he removed to London in 1803 J. was placed in charge. Retaining control for twenty-six years, he raised the Edinburgh to the highest rank. In 1806 J. went to London, where he had his famous duel with Moore, so satirised by Byron. In 1830 he was made Lord Advocate, and entered parliament. In 1834 he accepted a judge-hip and a peerage. Among his critical works are Samuel

Frederick Curzon, son of Earl Howe, their son being well known on the stage as

age. Among his critical works are Samuel Richardson (1853) and Jonathan Sunft (1853). See lives by Lord Cockburn, 1852; T. Carlyle, 1881; J. Taylor, 1892; and R. Bald, 1925.

Jeffreys of Wem, George Jeffreys, Lord (1848-89). Lord High Chancellor of Eng-land, b. at Acton, Denbighshire. In 1688 he was called to the Bar, and in 1683 be-came Lord Chief Justice. As the records of L'alive are derived from bottle sources came Lord Chief Justice. As the records of J.'s life are derived from hostile sources, his reputation for injustice and crucity must be accepted with some reserve. His considered to have been fair in general. The action for which J. is most notorious is his presidency of the Bloody Assize emperor of China.

clothing, harness, motors and other factories. Coal and limestone are found in the dist. It contains the state house, court house of Lincoln Univ. and sev. opposition to the Long Parliament the other institutions. Pop. 24,200. J. placed at its head (1686). In 1688 J. was the king's chief instrument in securwas the king's chief instrument in securing the committal to the Tower of the

Jehangir, or Salim Nureddin Mohammed
(1569-1627), became king of Delhi and
Agra in 1605, succeeding his father Akbar.
Proviously to his accession to the throne
he had rebelled against his father and had

he had rebelled against his father and had attempted to seize Agra. The most important events of his reign were the wars in the Deccan and Udalpur, and the loss of Kandahar. During the last decade of his reign, his captains rose in insurrection, and his sons entered into a conspiracy against him. J. has left a vol. of memoirs entitled Jehangiri, full of delightful self-revelations and side-lights on court life in India. Capt. Hawkes visited the king at belhi, and has also loft an entertaining vol. of memoirs descriptive of this reckless ruler.

Jehlam, see JHELUM.

Jehoash, see Jeanh.

Jeholachin, called Jeconiah, king of Judah, succeeded his lather, Jeholakim, in 597 B.c. He only reigned for three months, being dethroned by Nebuchadnezzar and carried into captivity at Babyion. But in the thirty-seventh year of his captivity Evil-merodach, king of Babylon, released him, and granted him an allowance for the rest of his life (see 2 Kings

Jehoiada, high priest of Judah, during the reigns of Ahaziah, Athaliah, and Joash. When Athaliah, the mother of Ahaziah, sought to destroy all the seed royal, J. protected Joash, the young son of Ahaziah, in the temple, and subsequently anointed him king while the guard slew Athaliah, the usurping queen, on his instructions. J. then destroyed the house of Baal, instituted a public fund for the repair of the temple, and executed the work of restoration (see 2 Kings xi. and xii.

work of restoration (see 2 kings xi. and xi. and 2 cfron. xxiii., xxiv.).

Jehoiakim, or Eliakim, king of Judah (608-597 B.C.), son of King Josiah and Zebudah, the daughter of Pedaiah, received the throne as a vassal of Pharachnechol. But Nebuchadnezzar, king of Babylon, sacked Jerusalem, and J. became his vascal for three years (c. 605-602 B.C.). His revolt from allegiance to Babylon roused an attack on Jerusalem by the Chaldrean and Syrians, Jerusalem was sacked und the king slain (see 2 Kinga xxiii. 34 ff., xxiv. 1-5; 2 Chron. xxxvi. 4-8)

Jehol: (1) Prov. of China. Area, 74,278 sq. m. Pop. 6,110,000. (2) or Chengteh, cap. of J. prov., 115 m, N.E. of Pelping. It was the summer resort of the last

Jehoshaphat (c. 876–851 B.c.), king of regarded the idea as too abstract for so dah, succeeded his father Asu, and comparing a period, and have sought for a more Judah, succeeded his father Asu, and commenced his reign as an able and wise ruler. rooting out idolatry, and building strong-holds throughout the land. But the prosperity of his reign was reversed when he sought affinity with Alab, king of I-rael. Ahab, seduced by false prophets and in opposition to the warning of Micaiah, set forth on an expedition against Ramoth-gilead, and persuaded J. to join him. Ahab succumbed to a wound received in the battle, and J. only just escaped with his life. J. returned to Jerusalem and rehis life. J. returned to Jerusalem and re-formed the judges and priests, and carried out a successful campaign against Moab and Ammon. But rum awaited a mer-cantile expedition to Tarshish sent by J. in conjunction with Ahaziah, king of 1-rael (see 1 Kings xv. 21; 2 Kings iii.;

John Still-xx.).

Jehoshaphat, Valley of, mentioned in Joel iii. 2 as the place where the Lord shall be against. The Joel II. 2 as the place where the Lord shun pronounce His judgments against the chemies of His people. The valley has been identified with the valley of Ber-achah where Jehoshaphat trumphed over Ammon and Moab (2 Chron. xx. 26), but the probable site of the valley is the gorge situated between one Mt of Olives and the

Mt. of the Temple.

Jehovah, prin. name for God in the O.T., appearing nearly 7000 times. It is now felt that there is no authority for such a pronunciation, which is founded on a mis-apprehension. The original word, known as the Tetragrammaton, consists of the letters JHVII, or better, YHWH. This name came to be considered too ineffable to pronounce, and hence the vowels of the word Adonai (lord) were inserted, as a direction to the reader to replace it by this word. Thus we have the form YeHo-Wall, of JeHoVall—hort e taking the place of short a. If the Tetrugrammaton is preceded by the word Adonal, the yowels of Elohim (God) are inserted, giving the form YelloWill. There has been much controversy both as to the original form of the word and also as to its origin and meaning. The early theory is now almost abandoned, there being general agreement in the acceptance of Ewald's agreement in the acceptance of Palace suggestion that the true form is Yahwch The forms Yahu and Yah also occur, both separately and as a component purt in proper names. The question as to the origin of the title is more difficult. Ex-odus til. 13 and vi. 3 imply that it wa odus III. 13 and VI. 3 imply that it was first revealed to Moees, but it had already been used earlier (e.g., tien, indeed, formed the chief means by which the composite authorship of Genesis was discovered (see Heyateuch). Some have held that it was borrowed from the Kenites who inhabited the region around Sinei. who inhabited the region around Sinai, and that the Mosale revelation was only and that the Mosaic revelation was only one of meaning and application. The moaning is given in Evodus iii. 11, by God himself, as 'I am that I am,' and later simply 'I am,' and according to this interpretation, which is generally accepted, the word is the third person singular impropert of the arrigant stem. Why

concrete explanation.

Jehu, son of Jehoshaphat, and grandson of Nimri, was king of Israel during the latter part of the ninth century R.C. He was general under Jehoram, and during the illness of that prince at Jezreel he sched the throne, and proceeded to seeme it by wholesale slaughter (see 2 Kings ix. ff.). He justified his cruel actions by the words of Elijah and the prophets. Elisha seems to have supported him as a useful substitute for Jehoram, from whom little action could have been expected. J. is mentioned in a tablet of Shalmaneser II. (842 B.C.) as paying tribute to Assyria. J. was noted for his reckless chariot driving: hence the latter part of the minth century B.c. his reckless charlot driving: hence the modern application of the name to reckless drivers

Jeisk, or Yeisk, tn., in the Kuban Valley, Caucasia, Russia, on the S. shore of the gulf of Taganrog in the Sea of Azov. Its exports include corn, flax, and wool. Pop.

50,000.

Jejunum, meaning enpty, one of the three arbitrary divs. of the small intestine (q.v.). It is about 11 in. wide, and 8 ft. long, and is the connecting portion lying between the duodenum and the ileum. In general, its structure resembles that of the duodenum.

Jelalabad, see JALALABAD.

Jelalabad, see JALALABAD.
Jelal-ud-din, or Rumi, famous Sufic poet of Persia, b. at Balkh in Khorasan. In memory of his son Ala-uddin, and his instructor Sufi Shams-uddin, both killed in a mob riot, he founded the order of Maulawi dervishes. This order is characterised by the mystic dance (Samā), symbolical of the movement of the spheres and of the soil. His most famous works are his odes, mainly composed in honour of the Maulawi dervishes, and his great of the Maulawi dervishes, and his great poem the Mathnawi.

Jelgava, Mitau, or Mitava (Lat. Mittavia, Lettish Felgava), tn. in the Latvian S.S.R., on the Aa. 25 m. S.W. of Riga. It was formerly the cap. of Courl and and the residence of the dukes in the sixteenth century. There are tanneries, flax and saw mills, and olicloth works, etc. In the Second World War J. was in Ger. occupation until 1944, the Russians recapturing the tn. on July 31 of that year. Pop. 31,000.

Jellachich, Joseph, Baron von (1901–59),

Austrian general and administrator, b. at l'eterwardein. He gained the confidence of the Creatians, and was appointed Ban of Creatia (1818). He took the chief part in suppressing the Magyar Revolt (1848-1849), and commanded his troops against Montenegro (1853). He wrote and pub.

Jellicoe, John Rushworth Jellicoe, first Earl (1859-1935), Brit. admiral; b. at Southampton; younger son of Capt. John moaning is given in Exons in. 12, by the himself, as 'I am that I am,' and later himself, as 'I am,' and according to this simply 'I am,' and according to this Steam Packet Co.; and great-grandson interpretation, which is generally accepted, the word is the third person singular time of the battle of Trafalgar. After lar imporfect of the archaic stem HWH some schooling at Rottingdean, J. passed (to be). Many scholars, however, have the preliminary examination for the navy ing-ship Brilannia. Became sub-lieutenant, 1878; lieutenant, 1880, with three first-class certificates. In 1881 he was appointed to H.M.S. Agincourt: he was present at the bombardment of Alexandria, July 1882; and he accompanied the naval brigade that murched with Wolseley to Ceirca and fought at Taleal, Keblr. Return. Origade that marched with woiseley to Cairo and fought at Tel-el-Kebir. Returning home, he won an £80 prize for 'gunnery-lieutenants,' 1883. His next ship was H.M.S. Monarch: from her, in May 1886, J. performed a life-saving feat for which he received the Board of Trade which he received the Board of Trade medal. He was for a while gunnery-lieutenant on H.M.S. Colossus: then junior staff-officer on H.M.S. Excellent; then first lieutenant on H.M.S. Sans Pareil. He was for three years assistant to Capt. (afterwards Lord) Fisher, director of naval ordnance. J. became commander in 1891, and was on board H.M.S. Victoria when she went down in the Mediterranean, June 22, 1893. He

LORD JELLICOE

next served in H.M.S. Ramillies: then. becoming captain in Jan. 1897, he became flag-captain on H.M.S. Centurion, and was chief of staff to Vice-Adm. Sir E. Seymour during the attempted relief of the Peking legations, 1900: severely wounded at Peitsang. He was naval assistant to the controller of the Navy 1902–03, and was Controller of the Navy 1902-05, and was then appointed to command of H.M.S.

Drake. Director of Naval Ordnance, 1905-07; he greatly improved the shoot-ing abilities of the navy. He was made subumbral surface is the mouth, bordered rear-admiral, Feb., and K.C.V.O., Aug.

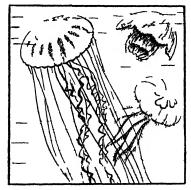

at the age of tweive and entered the training-ship Britannia. Became sub-lieuten-1907-08; lord commander and controller ant, 1878; lieutenant, 1880, with three of the Navy, 1908-10; vice-admiral, first-class certificates. In 1881 he was appointed to H.M.S. Agincouri: he was present at the bombardment of Alexandria, home fleet, 1911-12; and was Second Sea July 1882; and he accompanied the naval Lord, 1912-14. In 1913, for a while, he was the state of the state of the second division of the second divi left his shore duties to command the Fleet in mannuvres. On the outbreak of the First World War, J. was given com-mand of the Grand Fleet. He became full admiral, March 1915; and thence-forward till near the end of 1916 the fleet's hist. is his—especially the battle of Jut-land, May 31, 1916; wherein his flag flew on H.M.S. Iron Duke, and after which the on H.M.S. The Dike, and after which the Ger, fleet kept in harbour until its time for surrender. At the end of Nov. 1916, J. was made First Sea Lord, and relinquished command of the fleet to Sir David Beatty. He became chief of the Naval Staff, 1917. Suddenly ceased to be First Sea Lord at the end of that year, being succeeded by Sir Rosslyn Wemyss. No official explanation was given of the abrupt dismissal. He was elevated to the peerage as Viscount J. of Scapa and, later, received the thanks of Parliament together with a grant of £50,000. After the Armistice, he toured the Dominions in H.M.S. New Zealand, to prepare for reorganisation of Empire navies. Governor of New Zealand, 1920-23. He retired from the service in 1924, and in 1925 was made Earl J. and Viscount Brocas of Southampton for his part in the battle of Jutampton for his part in the battle of Jut-land, see JUTLAND, BATTLE OF. He pub.: The Grand Fleet, 1914-16, its Creation, Development and Work (1919), The Crisis of the Naval War (1920) (which narrates the chief features of his work in the critical year of 1917), The Submarine Peril (1934, on the peril of 1917 and its lessons for the future). Jenner, Edward (1749-1823), Eng. physician and originator of vaccination, b. at Berkeley, Gloucestershire. Left an orphan at six years old, he was brought up by his eldeet brother, the Rev. Stephen J., and educated for the medical profession. In 1770 he became a pupil of the famous John Hunter, with whom he remained two years. Declining offers of advancement in London, he returned to estab. a practice in Herkeley, wishing to be near his brother. J. never passed a musical examination, such examinations not being compulsory in his time. He bought the degree of Doctor of Medicine from a Scottsh univ. and later applied to Oxford univ. to grant him their honorary degree of M.D. and received it. He took great interest in the natural hist. of his dist. founded a local medical association, and was a general favourite in society. In 1788 he married Miss King-cote. As a child J. had himself suffered the risk associated with the inoculation of smallpox matter.

EDWARD JENNER
After a print engraved and coloured by
I. R. Smith

and from his apprenticeship days with Hunter he was curious about the nopular belief in Gloirestershire that persons who contracted cow-pox were thenceforth immune from smallpox. J. mentioned to various people, including Hunter, his interest in the matter, but he got no encouragement in his researches. But years later, the popular belief became estab, as a conviction in his mind and he saw that, if the were possible to transunit the cowpox virus from one individual to another (by moculating persons successively by the arm-to-arm method), the result would be an available source of cowpox lymph which would be independent of the existence or otherwise of the natural disease in

cows at any given time. If this could be done, he saw that another difficulty might arise: after transmission through many individuals the virus might lose its immunising power. J., having collected material to confirm his conviction con-cerning cowpox as a protective virus set out, in 1798, to investigate the above two propositions. After a number of experiments he pub. his results in his celebrated work, An Inquiry into the Causes and Efficis of the Variotic Vaccina, a disease discovered in some of the Western Countles of England . . . and known by the nume of the Cow-Pox (1798). In the first ed, of the Inquiry, J. adopted the attitude that efficiently performed vaccination carried out with lymph taken at the right stage of the pock would give complete and permanent protection against smallpox, a view he maintained all his life. This was unfortunate because it was not true, though those who did contract smallpox suffered only from mild attacks. J. was the first to have the conception which is expounded in his *Inquiry* and the first to have the courage to test his doctrines. After him no one else attempted to extend the province of artificial immunity until Pasteur in 1880 introduced the inoculation of fowls for fowl cholers. All modern methods of preventing certain infectious diseases by immunilogical methods trace diseases by immunilogical methods trace their ancestry back ultimately to the substitution by J. in 1798 of vaccination—which became an estab, fact by 1800. At first he met with great opposition, yet he secured a hearing from many influential persons including the royal family. Vaccination spread through England. Attempting in 1798 to introduce a system of receivable in the second the most of the most statement of the second the most statement. vaccination in London, he met with great opposition, but nevertheless secured a hearing from many influential persons, including the royal family. Vaccination spread through England and other countries with such results that in 1802 parliament voted J. a grant of £10,000 (raised a few years later to \$20,000), and on the Continent he was elected a member of most of the great scientific societies. At home, the great scientific societies. At home, however, the jealousy of his professional colleagues led to much bickering and irritation; he was worn with incessant work, and the death of his wife in 1815 affected him greativ. He retired from public life, but continued his investigations until struck down by apoplexy.

Jenson, Nicholas (or Nicol) (1420-81), Master of the Mint at Tours in the reign of Master of the Mint at Tours in the reign of Charles VII. of France and, according to some, a Walloon by descent. The king, hearing of Gutenberg's printing experiments, sent J. to Manz to obtain Gutenberg's secret. J. leaned the trade, but subsequently migrated to Venice. It is believed, however, that in the years 1462-1470 he was associated with Sweyonheim and Damagetz two ther. printers who had and Pannartz, two Ger. printers who had estab, themselves in a Benedictine monastery at Subjaco near Rome. At all events, he began printing at Venice about the year 1470, and there designed a rom. type of much beauty and merit that has been He is menclassic to the present time. He is men-tioned in the Cologne Chronicle of 1499 as a printer to whom some had erroneously given credit of being the first inventor of the art. Extant portraits of him appear to be imaginary. See M. W. Haynes, The

to be imaginary. See M. W. Haynes, The Student's History of Printing, 1930.

Jephthah, according to the narrative in Judges xi. I ft., was an illegitimate son of Gilead, after whose death he was driven out by his brethen. He became the leader of a band of freebooters, until he was recalled by the olders of Gilead to lead them against the Ammonites. This refract to do unless he was afterward. he refused to do unless he was afterwards made their judge, and this position was promised to him. He collected a large army and made a yow that if he was sucessful he would offer as a burnt-offering to Jehovah the first thing that came forth

her perpetual virginity. J.'s later exploits were against the Ephraimites. It has been suggested that two persons, Jair and J., are confused in this account.

Jeppesen, Knud (b. 1892), Dan, musicologist and composer, a pupil of Carl Nielsen (1865–1931). He occupies an eminent position in Dan. musical life as composer, educator and musicologist. After taking his musical degree, he continued his studies in Vienna with Guido Adler and Robert ies in Vienna with Guido Adler and Hobert Lach, obtaining his doctorate of philo-sophy with his thesis. The style of Pales-trun and the Dissonance, a detailed study of Palestrina's harmonic system. This work has been pub. in Dan., Ger., and Eng. As administrator and lecturer J. has held high posts at Copenhagen Con-servatoire and Copenhagen and Airhus Univs. He has written many works on Univs. He has written many works on music and ed. Acta musicologica, a quarterly concerned with musical science. Though not prolific as a composer, he has written a number of songs and motets and choral works, of which ' Lave og Jon ' and a 'Cantata in celebration of the Reforma-tion of 1536' are well known. His 'Te Deum Dameum' however, is probably his thest work, written for four solosts, two choirs and orchestra, the words being after the old version of the Ambrosian Hymn.

very fortile to live dates and opened. yery fertile; olives, dates, and oranges grow there. The inhabs, are occupied in sponge dishing. The chief tn. is Haumt-cs-Sik. Pop. of tn. about 3000; of is. 35,000.

from his doors on his return. This yow led to the sacrifice of his daughter, which bers of the Dipodide, a family of myomorsome tried to soften into a dedication of phous redents remarkable for their powers Jerboa, name popularly given to members of the Dipodide, a family of myomor-

of leaping. or leaping. They are terrestrial animals, inhabiting the sandy or grassy plains in Asia, E. Europe, and N. Africa. *Dipus*, the typical genus, is from 6 to 8 in. in the typical genus, is from 6 to 3 in. in length, with a long tail and naked ears; the fore-limbs are very short and have five fingers, while the curiously elongated hind-limbs have only three toes. It is by means of these enormous legs that they are able to leap when in danger, but when undisturbed they walk on them in an ordinary way. The Js. are also burrowing ordinary way. animals, using their strong incisors for that purpose; their habits are nocturnal, and they feed on roots, seeds, insects, birds' eggs, etc., and occasionally do great damage to grain-crops. They are sometimes eaten by the Arabs. D. hirtipes is a well-known species; Alactage is common on the Siberlan steppes, A. jaculus being known as the jumping rabbit; Platycercomys is distinguished by raport; Playercomys is distinguished by a flattened, lancet-shaped rail; Zapus is the so-called jumping-mouse of the U.S.A., and the genus Sminthus, whose legs are short and nearly equal, may be regarded as approaching most nearly to ancestral form.

Jeremiah, called also Jeremias and Jeremy, one of the greatest of the Heb. prophets, is described in the first verse of the book which bears his name as the son of Hilkiah, whom some have identified with the Hilkiah mentioned in 2 Kings xxii. He belonged to a priestly family of Anathoth, which he later quitted for Anathoth, which he have quitted in Jerusalem. The vision by which he was inspired to take up the prophetic work is given in the first chapter. This took given in the first chapter. This took place in the thirteenth year of the reign of King Josiah (c. 627 B.C.). Five years later occurred the tamour discovery of the Book of the Law by Josiah, which led to that prince's great attempt at reform. In this J. does not figure at all, though there is no reason to suppose but that he was in well sympathy with it. But it was not long before the prophet began to feel that no great or deep reformation could be car-ried out by the secular arm, and it was this that ied him to take up the individualistic attitude which marks him off from istic attitude which marks him off from the other prophots. His prophecles were spread over the reigns of Jehoahaz, Jeholakim, Jeconiah, Zedekiah, and part of the period of exile. The book of J., which is interspersed with accounts of historical incidents relating to general events and the life of J. himself added by a later hand, is tender and sad throughout. The prophet insists that the spiritual wellbeing of the chosen people is not bound up with their prosperity as a nation, and that only through defeat and oppression can the remnant be saved. He insists on the necessity of a spiritual religion and warns the read is that the povession of the temple of the Lord God will not secure them from defeat. He insists that the work of the Chaldrean will be accomplished not by succouring but by oppressing Israel. On account of the pessimism and, as was thought, lack of patriotism shown in his prophecies, J. was extremely unpopular and had to submit to much persecution.

They are terrestrial animals, aid of his triend Baruch, was cut to pieces and burnt, and he himself had to submit to frequent imprisonment under the most revolting conditions. After the capture of the city he received permission to dwell where he wished, and so attached himself to Gedaliah, the Babylonian governor. On the death of Gedaliah, he retired to Egypt, where tradition says that he met Egypt, where tradition says that he met his death by stoning at the city of Tah-panes. See expositions by G. Ewald, A. Graf, T. Cheyne, C. Ball, L. Elliott-Binns, 1919; G. A. Smith, 1929; see also W. H. Bennett, The Book of Jeremiah (Chaps. xxi.-lii.), 1894; and J. McFadyen, Jeremiah in Modern Speech, 1919. Jérémie, seaport in the is. and republic of Haiti, 119 m. W. of Port-au-Prince, has important trade in cocca, coffee, and log-

of Haiti, 119 m. W. of Port-au-Frince, has important trade in cocoa, coffee, and log-wood. The father of Dumas, the Fr. novelist, was b. here. Pop. 7000.

Jeréz de la Frontera (formerly Xeres), tn. of S. Spain in the prov. of Cadiz, situated on a vine-covered plain 12 m. N.N.E. of Cadiz. The tn. is chiefly tamous for its vines from which sherry is manufactured. Indeed, the wine lodges manufactured. Indeed, the wine lodges are a characteristic feature of J., but there are other buildings of note, the fifteenthcentury church of San Miguel, a tn. hall century church of San Miguel, a th. hall dating back to the seventeenth century, etc. Under the walls of J. the battle of Guadalete, which delivered Spain into the hands of the Moors, was fought in 711, and parts of the old walls still remain. The tn. was taken from the Moors by Altonso X. in 1265. Pop. 90,600.

Jerez de los Caballeros, tn. ot Estremadura, 40 m. S.E. of Badajoz, Spain, is the centre of an agric. dist. producing grain, fruit, vegetables, and cork. The main fruit, vegetables, and cora. wealth of the people consists or herds of swine and mules. Pop. 12,000. swine and mules. Pop. 12,000.

Jerfalcon, Gyrfalcon, or Fulcogyrfalco,

name of a species of falcon (q.v.) belonging to the Falconide: it is found in W. Russia, Scandinavia, Greenland, and Arctic America, and its colour varies from grey to white.

Jerichau, Jens Adolt (1816-83), Dan. sculptor, was a pupil of Thorwaldsen. He was commissioned to carve a frieze for the royal palace of Christiansborg, near Copenhagen, and this piece of work, which was finely executed, estab. him in high repute. Among his best classical studies are: 'Heracles and Hebe.' 'Ponelope,' and the 'Wedding of Alexander. His religious subjects include 'The Resurrection,' 'Adam and Eve,' and a figure of Christ. J. also made a portrait statue of

Jericho, once an important city of Palestine in the Jordan Valley, 15 m. N. E. of Jerusaicam. The site of the old city was in the midst of a fertile dist. where palms, rose trees, raisins, and balsams grew in profusion. According to the Hible narrative and other accepted authorities, the th. was captured by the Israelites on their entry into Canaan, refortified by Hiel the Bethelite, destroyed under Vespasian, and rebuilt under Hadrian. Antony is said to have given its groves to Cleopatra, and Herod the His book, which he had prepared with the Great dwelt there. In anct. times J. held

a fairly important position strategically, dominating the chief trade routes of antiquity from Jerusalem towards the E. But it was too isolated to be able to rely in an emergency on the help of friendly cities, and consequently it was, from a very remote age, surrounded by defensive walls; and both hist, and archeology agree that the city was frequently destroyed. Early in this century, Ger. excavators discovered the defensive ramparts of the old city of J., and their evidence, including the traces of destruction and of the segment to correlevate the dence, including the traces of destruction alone forms a genus. It occurs in Paleand of fire, seemed to corroborate the Biblical story. Further investigation in a long period without water.

the wall are found burned to the ground, their roofs fallen upon the domestic pot-tery within.' All these facts give strong support to the Bible narrative, making it support to the Bible narrative, making it probable that the fallon walls of the Late Bronze Age are actually those of the city which is said to have been taken and burnt by the Israelitos under Joshua. See Sir Charles Marston, New Knowledge about the Old Testament, 1933.

Jerioho, Rose of, or Anastatica hierochuntina, species of Crucifere, which also alone forms a genus. It occurs in Pales.

IN THE WINE CELLARS OF JERÉZ DE LA FRONTERA

1920 showed that the stone rampart was of the Middle Bronze Age (c. 1800 B.C.), but the date of the inner wall was left to but the date of the inner wall was left to be estab. by Sir Charles Marston's ex-pedition under Dr. John Garstang, Prof. of Archæology at Liverpool Univ. which proved that the inner wall belonged mainly to the Late Bronze Age, the period of Joshua. Cuttings made by Dr. Garstang, in June 1930, in the mound of old J.—the ruins of the walls are situated near the modern vil. El Riha (Arabic form of Jericho), on a low mound at the foot of the W. plateau—revealed that the fortifications of J. represent an almost continuous occupation, twice broken by invasion between 2000 and 1600 B.C.: at which latter date the walls were reconstructed upon the brink of the mound, and these in their turn perished in some conflagration. The W. side of the defences showed conthe w. side of the defences showed con-tinuous signs of destruction and con-flagration, the outer rampart (which is 6 ft. thick) suffering most, its remains falling down the slope. The most arrest-ing fact disclosed by Dr. Garstang is the traces of intense the 'including reddened falling down the slope. The most arrest-falling down the slope. The most arrest-young king's refusal, he led the revolt of ing fact disclosed by Dr. Garstang is the traces of intense tire 'including reddened (see Israrel). His erection of golden masses of brick, cracked stones, charred alves for worship at Bethel and Dan timbers, and ashes. Houses alongside led to his name becoming a byword in

Jeritza, Maria, Austrian seprano, b. at Brno, 1894. Studied plano, violin, cello, and harp. Cultivated voice when fourand harp. Cultivated voice when four-teen under Prof. Auspitzer of Brno. Made début as Elsa in Lohengrin at Olmutz, Austria, 1909. Member of Imperial and Royal Opera, Vienna, 1913. Metro-politan Opera Co., New York, 1921— Amer début as Marietta in Die Tote Stadt. Successful as concert singer. First Class of the Order for Meritorious Service, Austria, 1935. An Eng. trans. of her reminiscences, entitled Sunlight and Song, appeared in 1924.

Jeroboam I., son of Nebat, was the first king of Israel after its separation from Judah on the death of Solomon. He was ging of Brief was a burner of Solomon. He was made Solomon's tax-gatherer in his own dist. of Ephraim, but the suspicion that he was about to raise a rebollion caused him to make a hasty flight into Egypt. On Solomon's death he returned and headed the curbassy to Rehoboam, asking for a lightening of the taxation. On the

In the nineteenth century, ship-building, sea-faring, and overseas trading-and earlier days, privateering—were the mainstay. These activities have disin earlier days, privatoring the disappeared and the is. is now dependent upon agriculture, mainly for export, and upon seasonal tourist traffic. Import trade is substantial and is done almost entirely with the United Kingdom.

Early potatoes and tomatoes, both really authors and often in succession in

grown outdoors and often in succession in one season, are the main export crops. Pre-war annual exports, entirely to the United Kingdom, averaged about 60,000 tons of potatoes and 25,000 tons of tomatons of potatoes and 25,000 tons of tomatoes, and 53,000 tons of granito, of an aggregate value of about £2 millions. Tomato exports to the United Kingdom in 1947 reached a record of 44,590 tonvalued at £21 millions. Some 1000 head of cattle are exported each year, mainly to the United Kingdom and the U.S.A., also to Australia and New Zealand. The normal cattle pop. of the is. numbers about 10,000. The J. breed of cattle is remarkably free from disease and the high yield of milk and its high butter fat content is unsurpassed. Breeding standards tent is unsurpassed. Breeding standards are maintained by the breeders' organisations. The animals lose some of their peculiar characteristics after four or five generations have been bred overseas, and this ensures a recurring demand for cattle from the is.

J. has some peculiarities of fauna, also much archæological interest, notably inegalithic tombs, the finest being La Hougue Bie. See A. Saunders, Jersey. 1642-1990, 1930-33: Ward, Lock, and Co. (pub.) Guide to the Channel Isles, 1934: G. R. Balleine, A Bibliographical Dictionary of Jersey, 1948.

Jersey Breed, see under Cattle.

Jersey City, co. seat of Hudson co., New Jersey, U.S.A. At the N. the Hudson and Hackensack Rs. make it almost an ls.. whilst southward it is flanked by New J. has some peculiarities of fauna, also

and Hackensack rs. make it almost an is., whilst southward it is flanked by New York and Newark bays. It is separated from New York by I m. of riv., and connected with it by sev. lines of forries, the Hudson R. tunnels, and recently by the vehicular tunnel which was opened in 1928. It is the E. terminus of many rail. ways, and has spacious docks along its 12 in. of water frontage. l'ossesses many tobacco, rubber, and sugar-rofining fac-tories, crucible works, foundries, boiler works, and factories making rolling stock, motor cars, and wireless apparatus. It has large stock-yards, and cnormous numbers of sheep and cattle are slaughtered for New York and other mkts. It has a free library with more than 100,000 books. Education is well provided for in many public schools, the Hasbrough Institute, St. Peter's College, St. Dominic's Academy and St. Mary's Academy. Paulus flook occupied the site till 1820, when the city of Jersey was incorporated. The pop. has increased rapidly and reached 301,300 in 1940.

Jersey Shore, settlement on the W. fork It has large stock-yards.

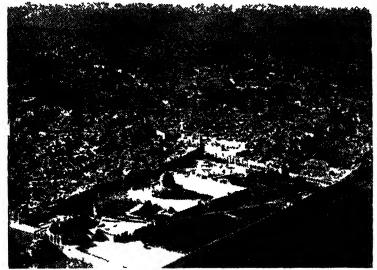

Jersey Shore, settlement on the W. fork of the Susquehanna R., in the Lycoming co. of Pennsylvania, U.S.A. There are silk mills, cigar factorics, foundries, etc. The dist. is agric. Pop. 5400.

Jerusalem, city of Judæa, and cap. of Palestine, of which country it constitutes a separate div. for purposes of administra-tion, situated 31° 46′ N. lat., and 35° 13′ E. long. It stands on a plateau formed of two hills, and bounded both E. and W. by valleys, that on the E. being the brook Kidron referred to in the N.T. To the N. there are also two valleys. The generally exact idea of the geography and geology of J. is due to a succession of investigations which commenced in 1833. After that time the work continued under various investigators, of whom the most prominent were De Vogué (1860-63), Capt. Wilson, R.E. (1866), Capt. Warren, R.E. (1872-75). Still more results have been obtained by the Palestine Exploration Fund, which commenced operations in 1894, and a great impetus was given to the work after the First World War, especially through the activities of the Brit. School of Archaeology in J. In the period 1910-30 the chief excava-To the N. there are also two valleys. In the period 1910-30 the chief excavations in the vicinity of J. were those of Parker in 1911, Weili in 1913 and 1923, Macalister and Duncan in 1923-25 and by Crowfoot in 1927-28, all of Ophel, the hill to the S.E. of the city, and the topo-graphical data from these excavations are of value as establishing the position of the City of David, and also as indicating, though not finally proving, that some of the rock-out caves may formerly have been used for royal tombs. Excavations at the Citadel at the Jaffa Gate, so con-spicuous a feature of the Walled City, have spicious a reature of the Walled City, have proved that the massive tower commonly called the Tower of David is really the Tower of Phasael, one of the three erected by King Herod about 25 B.c. as defences for his citadel and palace, and that it was inserted in a pre-Herodian wall on the N.W. corner of the anct. city, a large section of which has been uncovered section of which has been uncovered running across the Courtyard of the present Mameluke Citadel. Excavations in 1916 tend to confirm doubts which had in 1916 tend to confirm doubts which had arisen as to previously accepted beliefs about the extent of the first J., estab. in the time of the Heb. monarchy about 1000 B.c. to 587 B.c. The hill on which the Citadel stands is traditionally known as Mt. Zion, but the excavations do not support the theory that a part of the 'Stronghold of Zion,' the City of David and his successors was located on that and his successors, was located on that hill. Researches at the Walling Wall go to show that the boundaries of this celebrated relic coincide with those of the platform of the temple of Solomon, of which courses of stone are supposed to be in existence below the surface. Each of in existence below the surface. Each of the two hills which form the site of the city is a natural fortross, for the two are divided by a deep valley (the Tyropœon), and it is probable that from the earliest times they were so used. The lack of water must, however, have proved a serious disadvantage. The 'Virgin's Spring in the Kidron valley, and just outside the old city wall, is the only spring near the city, and there is but one important well within. The water in the Pool of Siloam is brought from the Virgin's Pool of Siloam is brought from the Virgin's

Spring by a rock-cut aqueduct, running the Ger. Catholic Church outside the Zion through the old Ophel wall. The Temple (comprising the dist, now known as the Haram) was built on the E hill. On the

Gate; the It. Hospital, designed like a Florentine palace; the Lutheran Church (comprising the dist, now known as the Haram) was built on the E hill. On the W. hill was built the upper city.

The chief monuments of interest to visitors are the Church of the Holy Sepulchre (q.v.), with remains of the basilica of Constantine, the Walling or W. Wall; the Mt. of Olives, the Tomb of David (Cænaculum); the Crusaders' Church of St. Anne; the Jewish Tombs in the Valley of Jenseulum; the Jewish Tombs in the Valley of Jenseulum; the Jewish Tombs in the Valley of Jenseulum; the Armenian Cathedral; Dung ('Cate of the Moors), S. wall

the Ecce Homo arch, the Church of the Tomb of the Virgin, and the Garden of Gethsemane. 'The old city within the walls, that city compact together' with its waulted sugs (bazaars) and narrow streets, that have undergone no change for contunes, with its steep alleys flanked in many cases by masterpleces of Saracenic architecture, may well, however, be regarded as the greatest monument of all,

and Zion ('Gate of the Prophet David'), S. wall, on Mt. Zion The Golden Gate, built in the fifth century on the Haram enclosure, was walled up by the Turks soon after they occupied Jerusalem in

soon after they occupied Jerusalem in the sixteenth century
J. has greatly altered in appearance since the kirst World War, and continued to develop throughout the Brit. mandatory regime. Some of the suburbs have gadded as the greatest monument of all, unique in its compactness, in its appear ance of hoary antiquity, and in that homo genefty which it is the alm of its prosent administrators (then the British mandatory gov) jealously to preserve (H. C Luke and E. Keth Roach, Handbook of Palestine and Transpordan, 2nd ed. 1930). There are big banks and com far more nuclean plan than those of even of the Moldings some of the most striking are the Anglican Cathedral and Close of St. George, built by George Jeffrey, the Franciscan Basilica in Gethsemane.

of last century there was not one building outside the cight gates of the city walls. But to-day hotels, large stores, and commercial buildings generally have been opened up outside the city proper, and with this development have come the garden cities. This greater J. has now spread half-way to Bethlehem to the S., the Nt Suggest of the N (the site of the days) in particular the present freedom outside the cight gates of the city walls. But to-day hotels, large stores, and commercial buildings generally have been opened up outside the city proper, and with this development have come the garden cities. This greater J. has now spread half-way to Bethlehem to the S., to Mt. Scopus to the N. (the site of the Brit. cemetery), and to the W. nearly to Ain Karim, the bp. of John the Baptist. Extension eastward is impossible, because there the land falls steeply into the Kidron Valley. Altogether more than seventy-five streets have been laid out in these new suburble, with such names as seventy-five streets have been laid out in these new suburbs, with such names as Isalah St., John the Baptist St., Herod's Way, Hezekiah St., and so forth, all of course being drawn from Biblical hist. Development has been on sound tn.-planning lines. The municipality has control over all building operations, and from the outset (1914) it was recognised that J. demanded specialised treatment, so that W. European architectural ideas should harmonise with an E. environment. should harmonise with an K. environment and E. conditions. The heauty of the buildings of J., considered apart from their sanctity, lies largely in the colour and texture of their stone, which, after a control has mallayed to a colden gray. and texture of their stone, which, after centuries, has mellowed to a golden grey. It blends in a remarkable manner the walls and gateways of the Old City, the towers of its many churches and monasteries, the modern commercial buildings along Princess Mary Avenue, and the villas of Rehavia and Qatamon. One of the aims of the Palestine Gov.'s tn.-planning commission under the mandatory regime was to maintain this unity of planning commission under the mandatory regime was to maintain this unity of character throughout the fast developing city by insisting on the use of stone for all buildings. The ubiquity of stone was threatened by the use of concrete, providing an instance of a W. technique, introduced by Jewish immigration, which conflicted with the traditional way of life. The account which Britain can give of her stewardship in respect of tn. planning in J. is one of which any administration might be proud. The successive measures of the Brit. planners during the thirty inight be proud. The successive measures of the Brit. planners during the thirty years of mandatory rule were directed to one or other of two objectives: the preservation of the Old City and the encouragement of high standards, hygienic, social, and esthetic, in the modern city, which during those thirty years, had fast been growing up around it. A proclamation was made by Lord Allenby as military was made by Lord Allenby as military governor in 1918 torbidding the crection, demolition, or alteration of any building within a 2500 metre radius of the Damescus Gate without a written permit, and this was only granted for building with an approved purpose (which excluded indus-trial building) and was subject to control trial building) and was subject to control of height and building material. Four, zones were defined: the Old City, which was to retain its medieval aspect and within which the traditional stone construction with vaulted roofs was advocated for any necessary rebuilding; the area immediately outside the city walls, where undesirable recent structures were to be demolished and new building pro-

days. In particular the present freedom from building in the Mt. of Olives region to the E. of the Old City which came within the third zone, is due first to the steps taken by the Brit. authorities and to the support of the Pro-Jerusalem Society. In 1930 the first complete tn.-planning scheme came into operation. An amplication of the Allenby provisions further safeguarded the Old City, and for the new matter control of the Allenby provisions further safeguarded the Old City, and for the new matter control of the converse of the control of the con tn., which covered an area nearly twenty times as large, detailed road plans were made and use-zones proposed for the areas to the N., W., and S.W.; and restrictions were placed on the permissible built-up area in order to secure some form of density control. An archeological area was defined, within which all building work had to conform to an Antiquities Ordinance. Certain defects of zoning and density in the 1930 scheme were re-medied in 1941. This amonded version of the scheme dealt with communication and instituted a classified road system, including an arterial ring road, besidedealing with overcrowded areas and open

including an arterial ring road, besidedealing with overcrowded areas and open spaces. All these measures were codified in the Tn. and Country Planning and Building Ordinance, 1947.

The building of Greater J. extends nearly as far as the Well of the Magn. Here the residences (and also those at Bethlehem itself) are especially handsome many of them having been built by native cratismen who had learned their trade in the U.S.A. and returned to Palestine as wealthy men. It is estimated that some £3,000,000 was spent between 1925-30 on the erection of private dwellings in Greater J., while over £250,000 was spent upon the handsome King David Hotel. On July 22, 1946, an entire corner of the hotel was destroved by hombs of Jewish terrorists. Military headquarters in Palestine and the prin. secretariat office, with the exception of that of the High Commissioner, were located in the building and over fifty persons were killed, including several senior Gov. officials. The most attractive of the garden cities are most attractive of the garden cities are Janjure, and Beth-Hakerem, while the new Arab colony of Tabliveh, S.W. of the city, has replaced what a few years ago was a waste, bearing a few olive trees. The largest and best known of the garden cities is the Talpioth, lying 8, of the city on the Bethlehem road, which has been developed by the Palestine Land Development. ment Company, and contains besides hundreds of stone dwellings -all detached and conspicuous for their balconies, arched windows, large verandahs, striking roofs, and fine gardens—a tn. hall, baths, synnigogue, theatre, and indeed all the amenities of an independent tn. community. Some of the most important public or commercial buildings completed in recent years in J. or outside the old city are the

Heb. Univ., opened by Lord Baltour in 1925, the new library on Mt. Scopus, containing the largest collection of Heb. books and papers in the world, the Pontificial Biblical Institute, the College of Jerra Santa, the Rothschild (Hadassah) Univ. Hospital on Mt. Scopus (dosigned by Eric Mondelsohn), the General Post Office (designed by Austin Harrison who designed Nuffield College), a good blend of W. functional ideas with E. motives, and the Anglo-Palestine Bank. J. being 1244 until 1917 J. remained in Moslem. and the Anglo-Palestine Bank. J., being a Holy City for three Faiths, is the seat of a number of Prelates and religious bodies. There are three Christian Patribodies. There are three Christian Patriarchs, Orthodox, Lat., and Armenian having the style of Beatitude, and, in addition to the Anglican Bishop in J., a Jacobite and a Coptic Bishop.

For long it was thought that the name of J. was given to the city after its con-quest by David, but this judgment has been reversed by the discovery of the Amarna tablets (c. 1400 B.c.) in 1890. Here the name occurs in the form Urusalim, some 500 years before the time of David. The derivation has been variously derived from Heb. forms meaning 'the city of peace,' 'possession of peace,' 'toundation of peace,' 'city of the god salam,' etc. In the Book of Joshua it is salin,' etc. In the Hook of Joshua it is possen of as Jebus, with the explanatory note 'which is Jer.' and an account is given of Joshua's assault on it. It soon fell back, however, into the hands of 'the stunger,' and it was not until the time of David that it was permanently captured and made the seat of the regal gov. (see Pavid). This occurred at the beginning of the tenth century B.C. For its hist, down to its destruction in the time of Zedekiah, see Israel, where is also given an account of the attempts to regiven an account of the attempts to re-build it under Ezra and Nehemiah, of the various foreign powers under whose dominion it successively came, and of the factions with which the city was torn, until the time of its utter destruction by Titus, the Rom. general. It was not long however, before the city was rebuilt, though on a smaller scale, by the Emperor Hadrian, and the new name of Ælia Camtoling was given to it. During the first few centuries it passed through a period few centuries it passed through a period of tranquility, but it again came into pro-minence as the habit of pilgrimage to sacred places grew up, and as spot after spot associated with ovents in the life of Christ were identified by revelations made Christ were identified by all Many great miraculously to individuals. Many great churches were erected, of which the first was Constantine's Church of the Anastass (1992) were the Holy Sepulchre. The was Constantine's Church of the Anastasse (336) near the Holy Sepulchre. The Church of St. Stephen and many other eccles, building, were erected by the Empress Eudocia from about 150 onwards, and Justinian built the Church of St. Mary, which later formed part of the Mohammedan mosque el-aksa. In 611 the city was taken by Chorcos, the Persian, and most of the churches were destroyed. It was recaptured by Heracilus in 627, but lost again nine years later, to remain in the hands of the Moslems until 1099. At the beginning of this period the mosque el-aksa was erected

dom of J. was not long-lived, nor was it by any means stable during its continuance. It fell in 1244, after having been for a short time in the hands of the ex-communicate Frederick II., to whom it had been ceded by treaty in 1229 after having been captured by the Moslems. From 1241 until 1917 J. remained in Moslem hands, and during this period its hist. was comparatively peaceful and uneventful. It passed into Turkish hands in 1517, and remained under Turkish rule until the remained under Turkish rule until the First World War of 1911-18, when it was taken by Gen. Allenby. Allenby ad-vanced on J. in Oct.1917. After cutting the Jaffa-Jerusalem railway at Ludd and El Ramleh, he occupied Jaffa on Nov. 16 and then began a movement to surround J., advancing on it from N., S., and W. All the Turkish positions round the Holy City were carried by storm, and thereafter the city was surrendered, on Doc. 9, without further resistance, thereby ending the Turkish domination of seven centuries. The tuil story of the brilliant capture of J. Will be found in the Record of the Advance of the Egyptian Expeditionary Force, compiled by Lt.-Col. H. Piric-Gordon, 1919. On his official entry Allenby made it known by proclamation that 'every sacred building, monument, holy spot, shrine, traditional site, endowment, pious bequest, or customary place of prayer, of whatsoever form of the three religious, would be maintained and protected according to the existing customs and beliefs of those to whose faiths they were sacred.' The condition of the city in Dec. 1917 is difficult to imagine when it is seen to-day. There were no sanitary arrangements in the old city, and the water supply came from private rain-fed cisterns; but the Brit. military anthorities not only placed any place of the distance of th ample samtary services at the disposal of ample amutary services at the disposal of the Governorate, but patrolled the Via Dolorosa to keep it free from pollution, and ordered a piped water supply to be installed. The inhabs, were not slow to appreciate that, whereas the Turks had left the city as to its water supply some-what worse than it was ..hen they first occupied it in the sixteenth century, the left, had in a few months given the city Brit. had in a few months given the city a supply on modern lines, and largely inde-pendent of the weather. From 1920 onpendent of the weather. From 1920 on-wards there were sporadic outbursts against the Jews on the part of the Arabs, especially in 1929—the Walling Wall riots—and from 1936—38, when under-ground Arab revolt against the Jewish inunigration and the National Home,

institution of this enquiry displeased the mediator, Count Bernadotte, in June : Zionists and was followed by terrorist out- but in the meantime the Anglican Cathedinstitution of this enquire displeased the Zionists and was followed by terrorist outrages organised by Irgun Zvi Leumi, the 'Stern Gang,' and Haganah, although disowned by the Jewish Agenov. Many outrages were perpetrated in J in 1946-47. With the ending of the Brit. mandatory regime in May 1948 war broke out in Palestine between the Arabs and Jowe It was hoped that a truce would protoct J. and the holy places, but in fact the war actually began in J. itself, when the Arab Legion from Transfordan shelled the Jewish quarters of the city and the Jews occupied various institutions from which

but in the meantime the Anglican Cathedral of St. George was soverely damaged by shell fire (June 5). The roof was wrecked, the pulpit and most of the windows destroyed, and there was much interior damage. Two days later the main dome of the Church of the Holy Sepulchre was penetrated by a mortar-shell fired from a Jewish position outside the City wall.

According to the decision of the United Nations the City of J. with its surrounding the and vils and all the Holy Places is to occupied various institutions from which be part neither of the Arab not the Jewish they fired on the Holy City and attacked | State, but is to be administered by an

J. generally. Churches, convents, and religious and humanitarian institutions religious and humanitarian institutions were made targets for cannon and rife fire, and some of these buildings were destroyed. Buildings occupied by the Jews included the Orthodox Gk. Convent of St. George, the convent of Nôtre Dame de France, the Fr. and It hospitals, etc.—all of which were occupied by Jewish forces on May 14-15, 2 e the date of the ending of Brit. rule. Shells were also fired into the Holy places from the Heb. Univ. and the Hadassah Hospital on Mt. Scopus. The convent of Nôtre Dame de France was largely destroyed. The Scopus. The convent of Notre Dame de France was largely destroyed. The Orthodox Armeman Convent received hundreds of shells fired by the Jews from the Benedictine Convent on Mt. Zion According to a protest circulated by the Lat. Patriarch to the Union of Christian Communities in Palestine most of the shells falling on the Holy Sepulchre and other Christian institutions were Jewish. other Christian institutions were Jewish. the purposes of administration, although In the same statement it was declared that the Arabs had respected holy places, churches, convents, and Red Cross institutions. A truce was arranged in J. soon agency. Access to them would be after the arrival of the United Nations guaranteed to all creeds and both govs.

Trusteeship and International International Trusteeship system, A special committee of the United Nations has completed its draft of a constitution for the Holy City and its report has been submitted to the Trusteeship Council But as late as the summer of 1949 the problem of the control of J. had not been settled though some progress had been made through the good offices of the com-mittee of the Palestine Conclusion Com-mission of the United Nations. It then mission of the United Nations. It the seemed to be agreed, unofficially between the Jews and the Arabs, that a partition plan which should be acceptable to the United Nations and the various religious faiths interested was the only practical solution. It was believed that the plan could be carried out without detaching J either from Israel or the gov. which would event-ually represent Arab-held Palestino. The plan, still in its early stage, was as follows the city would be divided into two parts for that of the pilgrims.

would be responsible for their socurity and that of the pilgrims.

Jerusalem Chamber, part of the deanery in Westminster Abbey, was originally the abbot's parlour, part of the abbot's house. it probably received its present name from the tapestries of the hist, of Jerusalem which formerly adorned it. The name is also noteworthy on account of its connection with the death of Henry IV., as narrated by Fabyan the chronicler (cf. Shakespeare's Henry IV., pt. 2, iv. 4). The chamber was restored in 1624, and The chamber was restored in 1621, and here the Assembly of Divines met in 1643. In later times it was the scene of the labours of the revisers of the A.V. of the libbe (version of 1831). The crown is lodged here on the night before the coronation. The chamber is 36 ft. by 18 ft. and the panelling is of the time of themsy VIII.

lienry VIII.

Jervaulx Abbey, ruin of an anct. Cistercian monastery which was once a great centre of life for the hamlet of Jervaulx, in Yorkshire, England. What is left of the cruciform church, the cloistral courts, chapter house, and refectory, etc., belongs

chapter house, and refectory, etc., belongs to the Transitional Norman or Early Eng. The last abbot was hanged in 1637, because he was implicated in the Pilgrinage of Grace.

Jervis, John (1734–1823), admiral, fought in Keppel's action of 1778. He received the Order of the Bath after seizing the Fr. ship Peyase in 1782, and took part, during the same year, in the relief of Gibraltar by Lord Howe. In the course of the war with France at the time of the Revolution, he took possession of the W. Indian is. of Martinique, Guadaloupo, and St. Lucia. In 1797 he ventured as admiral to 1608, as a Liberat. He Geame Solicitor-General, was knighted, and made privy councillor and Master of the mode of the Mildle Ages, which had designed upon it the genealogy, of Christ from 'the root of Jesse' (Is. xi.), father of David. There are examples at Wells, Chartres, of the war with France at the time of the shire, Downside Abby, Leicestershire, and St. Lucia. In 1797 he ventured as admiral to 1608, as a Liberat. He deamed to a mode of the Master of the made privy councillor and m

Jesse, John Heneage (1815-71), Eng.
historian, a clerk in the Admiralty, after historian, a cierk in the Admiralty, after cudeavouring to write poetry, turned his talents to the field of historical memoirs. In 1840 he pub. Memoirs of the Court of England during the Reigns of the Stuarts, and, encouraged by the reception of this work, followed it with others of a like nature, the best of which dealt with the Lafe and Reign of George II (1862). His most valuable contribution to literature was George Selwyn and his Contemporaries (1843).

Jessel, Sir George (1821-73), Eng. judge, b. and d. in London, was of Jewish extraction. He was called to the Bar in 1817, made a Q.C. in 1855, and entered Parliament in 1868, as a Liberal. He became Solicitor-General, was knighted, and

Jest-books. There are two kinds of J.

—compilations of witty sayings and practical jokes ascribed to some particular wit to ensure their sale and popularity, and collections of facetics admittedly brought together from various sources. The monkish reconteurs of the Middle Ages doubtless brought and spread many tales from the E., but numbers of typical jests and practical jokes probably existed independently throughout all countries and races of mankind, allowing for slight local changes. Among famous J. may be mentioned: Tarlion's Jests: a Hundred Mery Talys (c. 1525, first extant edition, 1611): The Witty and Entertaining Exploits of George Fluchanan, commonly called the King's Fool (Buchanan long being famous rather as a humorist than a humanist): Joe Miller's Jest-Book, or the Witt's Vade Mecum (1739, really compiled by John

Mottley, 1692-1750). Other similar collections are the Jests of Scogin, by 'A. B. of Phisicke Doctour,' 1613; Tales and Quick Inswers, very Merry and Pleasant to Rede (about 1535); John Taylor, Wit and Mirth, 1629, more original than most; and Wit and Drollery, 1661; by 'The most refined wits of the Age'; Merry Drollery, 1661; and Viestminster Drollery, or a choice collection of the newest Songs and Poins both at Courts and Theaters, by 'a Person of Quality,' 1671 (reprinted by Roberts of Boston), of the Cavalier period.
